THE CLIFTON SPRINGS SANITARIUM and CLINIC

THE CLINIC

Medical sections for the care of metabolic and cardiovascular diseases, arthritic, psychoneuroses gastroenterology, pediatrics and hematology as well as general diagnosis are available Surgical sections are available for general surgery and the various surgical specialties Laboratory sections are maintained for radiology and pathology The clinic is general and maintains competent medical, surgical and laboratory staffs All types of general medical and surgical cases are received for diagnosis and treatment. Recognized forms of physiotherapy are provided There is an excellent dietetic service No cases of active pulmonary tuberculosis contagious disease epilepsy or insanity are accepted

THE SANITARIUM

REST, RELAXATION, MEDICAL CARE

The Sanitarium has all the atmosphere of a fine hotel with individual rooms and tasteful decorations A special feature is made of occupational therapy of all kinds with competent staff and facilities Other features are large cheerful solarium billiard room complete gymnasium, complete bath and massage department The spacious grounds include a nine hole golf course All the sanitarium facilities are open to guests who do not wish examination and medical care but come simply for the baths and massages and rest and recreation Modern medical equipment and superb location offer the combined advantages of a medical center and rural Spa

PROVE CAMEL MILDNESS *for Yourself!*

R. J. Reynold Tobacco Co. Winston-Salem N. C.

According to a Nationwide survey

MORE DOCTORS SMOKE CAMELS THAN ANY OTHER CIGARETTE

Doctors smoke for pleasure, too! And when three leading independent research organizations asked 113 597 doctors what cigarette they smoked the brand named most was Camel!

Test for yourself what throat specialists reported when a 30-day smoking test revealed:

"NO THROAT IRRITATION due to smoking CAMELS!"

MAKE YOUR OWN 30 DAY CAMEL MILDNESS TEST Smoke Camels, and only Camels, for 30 days Prove for yourself how mild Camels *are!*

Hundreds of men and women, from coast to coast, recently made a similar test. They smoked an average of one to two packs of Camels a day for 30 days. Their throats were carefully examined by throat specialists And after a total of 2470 examinations—these throat specialists reported *"not one single case of throat irritation due to smoking Camels"*

But prove it yourself in your "T Zone (T for Taste and T for Throat) Let YOUR OWN TASTE tell you about the rich, full flavor of Camels choice tobaccos. Let YOUR OWN THROAT give the good news of Camels cool, cool mildness.

It Can Happen Here

Example of severe rickets in a sunny clime

LEST WE FORGET—we who are of the vitamin D era—severe rickets is not yet eradicated, and moderate and mild rickets are still prevalent Here is a white child, supposedly well fed, if judged by weight alone, a farm child apparently living out of doors a good deal This boy was reared in a state having a latitude between 37° and 42°, where the average amount of fall and winter sunshine is *equal to that in the major portion of the United States* And yet such stigmata of rickets as *genu varum* and the quadratic head are plain evidence that rickets does occur under these conditions

How much more likely, then, that rickets will develop among city-bred children who live under a smokepall for a large part of each year True, vitamin D is more or less routinely prescribed ys for infants But is the antiricketic routinely admin- the home? Does the child refuse it? Is it given in some ed form purchased from a false sense of econo ecify the kind?

ETICYLOL

most potent oral estrogen therapy

A single 0 02 mg tablet of Eticylol* (ethinyl estradiol) costs only a few cents This small dose, administered daily, is sufficient to maintain the average menopausal patient

Eticylol is not only convenient but is pleasant to take – with no disagreeable odor or after taste The "sense of well being," associated with the use of naturally occurring estrogens, is usually experienced Daily administration of this steroid sex hormone maintains a relatively stable level of estrogen in the body When therapeutic doses are used, side effects rarely occur

ETICYLOL Tablets of 0 02 mg (white), and 0 05 mg (yellow) – bottles of 100 and 250

*Formerly Ethinyl Estradiol-Ciba

petechial nipple lesion:

Occurs early in nursing due to continued excessive sucking action by infant

fissured nipple:

Usually seen after the fifth postpartum day Consists of a break in the epithelium ordinarily towards the side of the nipple

Prevention and treatment of fissured nipples

Brougher (1) reports that in treating postpartum patients with demonstrable nipple fissures, local dressings with Vitamin A and D Ointment produced "gratifying subjective relief and objective improvement ' Concerning prevention, this investigator observed that in 200 postpartum patients who used prophylactic dressings of Vitamin A and D Ointment, the incidence of fissured nipples was three times less than in patients using routine nipple care with other local measures

White's Vitamin A and D Ointment—for prevention and treatment of nipple erosions and fissures—provides the natural vitamins A and D derived from fish liver oils in a pleasantly fragrant lanolin petrolatum base Prophylactic treatment of nipples should be instituted at the 7th month of pregnancy, continuing through lactation White Laboratories, Inc., Pharmaceutical Manufacturers, Newark 7, N J

ITAMIN A & D OINTMENT

Local penicillin reduced intranasal bacteria 99%

Proceedings of the Society of American Bacteriologists,
47th general meeting May 13 17 1947

A series of patients was treated intranasally with local penicillin, *500 units per cc*, for 5 consecutive days At the end of this time, the bacteria count was reduced from an average of 7,363 per cc of nasal washings to the amazingly low average of 42

In Par-Pen you have a preparation that combines the potent antibacterial action of penicillin, *500 units per cc*, with the rapid and prolonged vasoconstriction of 'Paredrine Aqueous'

For sample and full information, write Par-Pen on your prescription blank and mail it to us at 429 Arch St, Philadelphia 5, Penna

Important advance in blood banking

BAXTER

"Fuso-Flo"

STOPPER

Since Baxter introduced the closed system, the Fuso-Flo stopper is the most important new step in making blood and plasma infusions trouble free. This exclusive Baxter feature provides efficient preliminary straining, prior to filtration. It assures proper uninterrupted flow regardless of condition or age of blood or plasma. Fuso-Flo is another example of continuing Baxter research and development in parenteral therapy. No other method is used in so many hospitals.

THE B... NY

The incidence of mild protein deficiencies in children, predisposing toward infections and edema, is reported[1,2] much greater than generally realized. Infant and adolescent requirements—not only for tissue repair and maintenance, but also for growth—are much higher than in adulthood[3] To insure adequate protein intake in infancy, DRYCO—Borden's high protein infant food—is ideally suited as a basis for formula building It furnishes *all the essential amino acids* Its low fat content minimizes gastro-intestinal upsets due to fat intolerance, while its intermediate carbohydrate content lends itself for prescription with or without added carbohydrate. Quickly soluble in cold or warm water, DRYCO contains adequate vitamins A, B_1, B_2 and D, plus essential milk minerals.

consider the advantages of PRANONE

(ANHYDROHYDROXY PROGESTERONE U.S.P XIII)

in dysmenorrhea

PRANONE* is clinically effective, affording relief in the majority of cases of dysmenorrhea.

Anhydro-hydroxy progesterone [PRANONE] was administered orally to a series of 28 patients through 40 menstrual cycles. Seventy-one per cent of the patients were benefited by the medication."[1]

PRANONE therapy is physiologic, aiming at correction of the responsible hormonal imbalance.

"This compound has been shown to have progestommetic activity when administered orally in immature rabbits and to produce in human beings a progestinal effect on the estrogen primed endometrium."[2]

PRANONE therapy is simple and convenient for both patient and physician.

"The oral method saved the time of both the patient and the doctor. Numerous trips to the office were unnecessary when tablets of pregneninolone [PRANONE] were given the cost of six to ten days treatment was much less."[3]

DOSAGE. PRANONE 10 to 25 mg daily for eight to ten days preceding the expected date of menstruation. Occasionally higher doses may be required.

PACKAGING. PRANONE, Anhydrohydroxy progesterone U.S.P. XIII is available in tablets of 5 or 10 mg. Boxes of 20, 40, 100 and 250 tablets. Also 25 mg. boxes of 20 and 100 tablets.

Specific therapy

The Lederle organization has devoted itself for many years wholeheartedly to the prosecution of research to develop substances exerting a specific effect upon disease These efforts have been crowned with success, especially in the fields of nutrition and of bacterial, rickettsial, and virus-like infections At this time, two products are the talk of the professional world

AUREOMYCIN Hydrochloride *Lederle*

This new antibiotic is useful in the control of Rocky Mountain spotted fever, Q fever, typhus, rickettsialpox, lymphogranuloma venereum, psittacosis, primary atypical pneumonia, acute brucellosis, infections caused by penicillin-resistant Gram-positive cocci (especially staphylococci), and infections caused by coli-aerogenes bacteria In typhoid fever, large doses may be helpful

FOLVITE* Folic Acid *Lederle*

Specific for the hemopoietic malfunction in sprue, and nutritional, gestational, pellagrous, and allied macrocytic anemias accompanied by megaloblastic bone marrow

PUZZLE: Find the complex equipment

in this picture of penicillin inhalation therapy

No complicated tubes, valves, oxygen tanks or air machines are required with the Aerohalor The patient may use this inexpensive little device for oral or nasal inhalation at home, at work or in your office It consists of a discharge chamber plus interchangeable mouthpiece and nosepiece It is used with disposable Abbott Sifter Cartridges, each containing 100,000 units of finely powdered crystalline penicillin G sodium For oral inhalation, the patient simply attaches the mouthpiece to the discharge chamber, inserts a cartridge of penicillin and 'smokes it like a pipe—by inhaling, removing, exhaling Nasal use is similar except that the nosepiece is used This treatment is indicated for infections of the respiratory tract produced by organisms susceptible to penicillin It is contraindicated in infections not susceptible to penicillin and for patients allergic to the drug

No serious reactions have been reported

The Aerohalor and Abbott Sifter Cartridges are available at pharmacies everywhere—Cartridges on prescription only For complete, illustrated literature, write ABBOTT LABORATORIES, North Chicago, Ill

ABBOTT'S POWDER INHALER

Clinically approved

Today, there is a wealth of clinical evidence supporting the use of Meonine as a supplement to the protein-rich diet usually prescribed for liver damage associated with malnutrition, pregnancy, allergy, certain chemical poisons, and alcoholism

Typical of this evidence is a Beams-Endicott paper* The authors reported that a methionine supplement seemed to cause regeneration of the liver parenchyma in cirrhotic patients irrespective of the amount of protein and vitamins in the diet

Complete bibliography on request Meonine is supplied in 0 5 gram tablets Wyeth, Phila , Pa.

"SMOKE LESS...OR CHANGE TO PHILIP MORRIS"

. . . if smokers are affected by the irritant properties of cigarette smoke

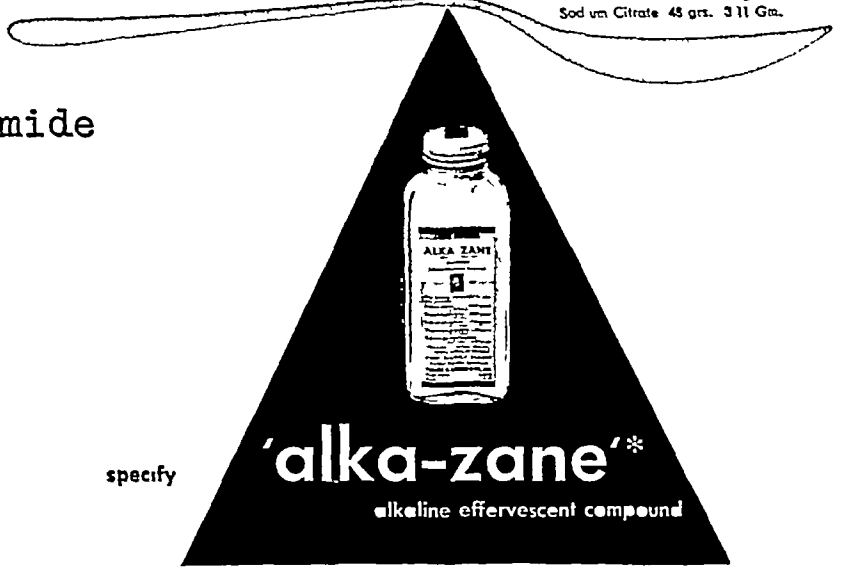
Sometimes physicians may advise "Don't smoke at all" But even where that is indicated, how many patients will forego the pleasure of smoking?

For such patients, as for all smokers, the choice should be the least irritating of cigarettes Many throat specialists suggest Philip Morris* because they are convinced from published studies**, as well as their own observations that Philip Morris alone, of all the leading cigarettes, is by far the least irritating to the sensitive tissues of the nose and throat

Perhaps you too will find it advisable to suggest to your patients who smoke "Change to Philip Morris"

PHILIP MORRIS

Philip Morris & Co , Ltd , Inc , 119 Fifth Avenue, N Y.



IF YOU SMOKE A PIPE We suggest an unusually fine new blend — COUNTRY DOCTOR PIPE MIXTURE Made by the same process as used in the manufacture of Philip Morris Cigarettes

*Completely documented evidence on file

for maintaining urinary alkalinity during sulfonamide therapy

One heaping teaspoonful provides:
Calcium Glycerophosphate
1 6/10 grs. 0 10 Gm
Magnesium Phosphate 3½ grs. 0.22 Gm.
Calcium Phosphate 3½ grs. 0.22 Gm.
Potassium Bicarbonate 7 grs. 0.45 Gm.
Sod'um Bicarbonate 17 grs. 1 10 Gm.
Sod um Citrate 45 grs. 3 11 Gm.

specify **'alka-zane'*** alkaline effervescent compound

'Alka-Zane'* Alkaline Effervescent Compound gives a supply of different bases normally present in the body The use of a variety serves to be more "natural" than administering a single alkali such as sodium bicarbonate

'Alka-Zane' Alkaline Effervescent Compound is a pleasant and efficient agent for alkalinizing the urine in addition it encourages a good fluid intake These properties make 'Alka-Zane' a very useful product during sulfonamide therapy where it is necessary to raise the pH of the urine and insure a good fluid intake to prevent crystalluria 'Alka-Zane' Alkaline Effervescent Compound in water produces a palatable drink that makes it easy to get patients to take enough fluids

How Supplied 'ALKA-ZANE' Alkaline Effervescent Compound is supplied in 1 1-2 oz 4 oz and 8 oz bottles

Now! CHLOROPHYLL* AEROSOL THERAPY

the new advance in the Inhalation Treatment of Respiratory Tract Infections

CHLOROPHYLL AEROSOL THERAPY, as made possible by *Chloresium Aerosol Solution enables the physician to provide the remarkable therapeutic effectiveness of chlorophyll in the inhalation treatment of both upper and lower respiratory tract infections It is the result of intensive laboratory and clinical investigation to meet the long-felt need for an effective nontoxic healing decongestive, antibacterial and deodorizing agent for use in inhalation therapy

For use with any standard nebulizing equipment

Chloresium Aerosol Solution is a specially processed preparation containing the purified therapeutically active *water-soluble* derivatives of chlorophyll "a" ($C_{55}H_{72}O_5N_4Mg$), designed for use with any standard nebulizing equipment It is a natural, nontoxic, biotherapeutic agent and may be used either alone or, where indicated, as a solvent vehicle for penicillin or other antibiotic inhalation therapy

A unique combination of advantages

Chloresium Aerosol Solution provides the following unique and fundamental advantages in inhalation therapy

Absolutely nontoxic
Accelerates healing by stimulating normal cell metabolism
Decongests, promptly, without rebound phenomena
Exerts antibacterial effect particularly on secondary saprophytic, proteolytic invaders
Does not interfere with ciliary activity, tends to restore normal motility if impaired
Can be used freely—especially valuable in the field of pediatrics
Deodorizes fetid, foul-smelling conditions
May be used as solvent vehicle for antibiotic inhalation therapy

Indicated for all respiratory tract infections

The value of Chloresium Aerosol Solution used alone or as vehicle for antibiotics has been demonstrated in the treatment of most infections of the respiratory tract including acute and chronic sinusitis, rhinitis, pharyngitis, ordinary coryza ozena, acute and chronic laryngitis, bronchitis, bronchiectasis, lung abcesses and other deep-seated inflammatory conditions

ELIXIR VITAMIN B COMPLEX-MRT

ELIXIR VITAMIN B COMPLEX-MRT—IN NEUROPATHIES

In a study relative to the management of diabetic neuropathies, a prominent clinician reports a return to 80-85% of normal vibratory sense (Vibrometer readings) in patients—upon whom were used ELIXIR VITAMIN B COMPLEX MRT *as the sole therapeutic agent.*

In marked contrast, cases upon which were employed, 25 highly potent B complex capsules daily, plus 100 mg quantities of B_1, B_2, and niacinamide respectively, responded only to the extent of from 20-25% This established beyond doubt, the superiority of whole vitamin B complex therapy—ideally exemplified by ELIXIR VITAMIN B COMPLEX MRT These conclusions fall in line with the findings of Lewey and Shay[1] who have reported on the futility of attempting curative results with synthetic vitamins in neuropathies, and have stressed the necessity for natural substances to effect remissions

ELIXIR VITAMIN B COMPLEX-MRT—FOR MAXIMUM THERAPEUTIC RESPONSE

ELIXIR VITAMIN B COMPLEX MRT satisfies the strictest requirements for complete and potent B complex therapy, maximum response is assured Your patients will *"feel"* better! Each teaspoonful (5 cc) derived from 19 grams of nature's richest B complex storehouses—liver, rice polishings, brewer's yeast, wheat germ and honey, contains 2 mg. B_1*, 3 mg. B_2**, and 20 mg niacin and niacinamide plus rich and balanced amounts of pyridoxine, pantothenate, folic acid, thymine, B_{12}, choline, biotin, and all other B factors both known and unidentified

ELIXIR VITAMIN B COMPLEX-MRT—DOSAGE

Prophylaxis 1 teaspoonful daily—children in proportion

Therapy 1 teaspoon to 1 tablespoonful T I D as directed

(ELIXIR VITAMIN B COMPLEX-MRT because it is exceptionally palatable, may be taken undiluted. If preferred it may be incorporated into milk fruit juices or any other convenient food base)

ELIXIR VITAMIN B COMPLEX-MRT—HOW AVAILABLE

ELIXIR VITAMIN B COMPLEX MRT is available in 8 ounce, 16 ounce and gallon containers at all prescription pharmacies

The newly diagnosed diabetic and Globin Insulin

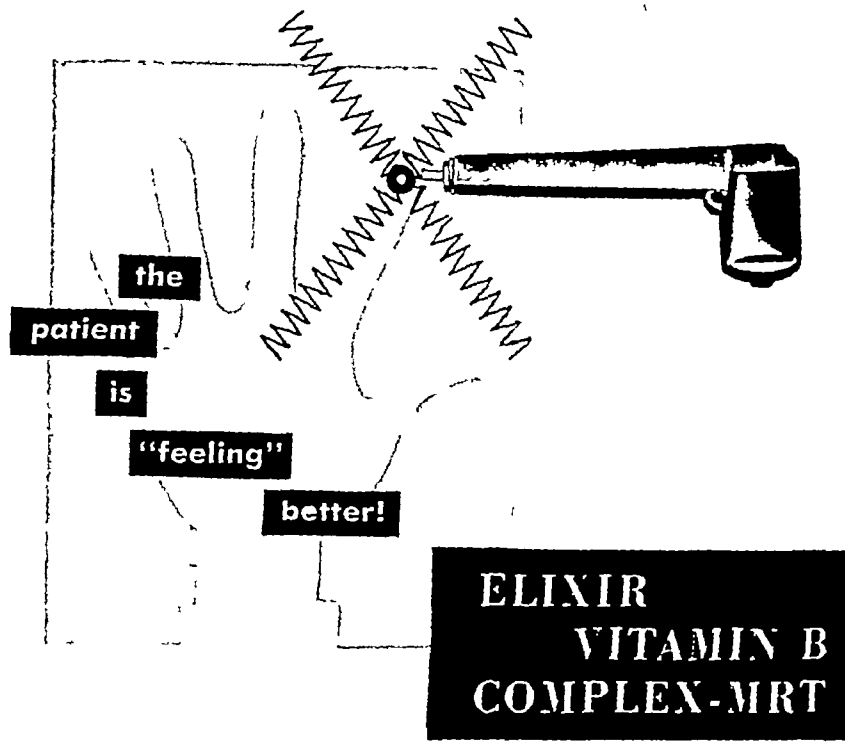
WHEN DIETARY MEASURES ALONE cannot control a recently established case of diabetes and insulin must be resorted to, *one daily injection* of intermediate-acting 'Wellcome' Globin Insulin with Zinc will often prove both adequate and beneficial This simplified regimen can be initiated in the following manner

ESTIMATING THE DOSAGE: The simplest method is to start with 15 units of Globin Insulin and increase the dosage every few days, as required A closer estimation is obtained by quantitative sugar determination of a 24-hour urine specimen For the initial dosage, ⅔ of a unit of Globin Insulin is given for every gram of sugar spilled in 24 hours

Both diet and dosage must subsequently be adjusted to meet the needs of each individual patient

ADJUSTING THE DIET: In general it has been found that a good carbohydrate distribution for the patient on Globin Insulin consists of 1/5 of the total carbohydrate at breakfast 2/5 at the noon meal, and 2/5 at the evening meal Any tendency toward midafternoon hypoglycemia may usually be offset by giving 10 to 20 grams of carbohydrate between 3 and 4 p m

This starting diet may subsequently be adjusted as required to suit the needs of the patient Final adjustment of carbohydrate distribution may be based on fractional urinalyses



ADJUSTING TO 24-HOUR CONTROL Simultaneously adjust the Globin Insulin dosage to provide 24-hour control as evidenced by a fasting blood sugar level of less than 150 mgm , or sugar-free urine in the fasting sample

'Wellcome Globin Insulin with Zinc is a clear solution comparable to regular insulin in its freedom from allergenic properties Available in 40 and 80 units per cc vials of 10 cc Accepted by the Council on Pharmacy and Chemistry, American Medical Association Developed in The Wellcome Research Laboratories Tuckahoe New York U S Patent No 2,161,198 LITERATURE ON REQUEST

VOLUME 49 JANUARY 1, 1949 NUMBER 1

Editorials

The Annual Meeting

The Medical Society of the State of New York will hold its 1949 Annual Meeting at the Hotel Statler, Buffalo, from May 2 to 5, inclusive. You are asked to note these dates *now* on your brand new calendars or in your diaries, for even "if winter comes can spring be far behind?"

Accommodations will be necessary for those who plan to attend from other parts of the State. Reserve yours now and make arrangements to come for as many days as you can. Your Convention Committee and the Subcommittee on Scientific Exhibits have been working hard to assure you of an interesting meeting. Do not let them down. For your own information, and in appreciation of their efforts to bring you the latest and best in their power to obtain, come to the Annual Meeting. See your old friends there, make new ones, let the commercial exhibitors, our good friends who make the meeting possible, show you what is new to help you practice modern medicine.

Make your reservations early.

The $64 Question

In these days of popular, even if boresome, radio quizzes, it has become customary to regard the $64 question, when successfully answered, as the one that hits the jack pot. It is noteworthy that the customer progresses by stages to the $64 question and is entitled to try for this only after he has correctly answered a series of questions having less monetary value.

The same set of conditions might be said to be applicable to the use of the laboratory in the diagnosis of disease. In approaching a diagnostic problem, the clinician frequently finds it necessary to invoke the aid of laboratory methods in his attempt to hit the jack pot. In the course of his study of the history and clinical findings, certain leads emerge, entailing the use of the x-ray and the clinical

laboratory for the purpose of confirming or excluding certain of the clinical facts and arriving at a diagnosis His approach to the use of these ancillary methods will depend in a large measure on his familiarity with laboratory methods, their simplicity and economy of approach, and the limitations of the respective methods available in his hospital laboratory, as well as on the intrinsic complexity of the problem itself If he be sufficiently well versed in the art of using the laboratory, obviously he might be able to obtain the solution of his problem by asking simply the $2 or the $4 question only On the other hand, if he uses a less precise approach, not uncommonly he unwittingly asks the $64 question first To cite a familiar example—suppose his problem is that of lymph node enlargement The clinician familiar with laboratory methods will invariably request first a complete blood count, which often supplies the immediate answer if the case be one of leukemia This diagnostic answer is forthcoming at the simplest level of laboratory investigation at a minimum of cost to the patient and expenditure of laboratory time and resources, and might be compared to the $2 question

His first attempt, however, might not be successful, but unlike the radio quiz, he is entitled to try for more This he does by asking the $4 question—in other words, he requests a bone marrow biopsy which, if it shows evidence of leukemic infiltration of the marrow, will establish his case as one of aleukemic leukemia at a relatively low cost of laboratory effort and expense If, on the other hand, the biopsy is negative, then he is faced with the consideration of investigating directly the enlarged lymph nodes This he might do by means of an aspiration biopsy, a method of little expense and inconvenience, but one which is fraught with a certain amount of diagnostic uncertainty because of its intrinsic limitations At this point his decision should be influenced by his clinical knowledge of the history and the physical findings in the case For example, if the lymph node enlargement be of a regional nature only, he might entertain the diagnosis either of primary lymphoid disease or metastatic disease from a clinically unrecognized primary focus If the latter be the case, an aspiration biopsy should have little difficulty in establishing the metastatic nature of the process, because the cells examined by the pathologist will have a morphologic pattern entirely foreign to that of the lymph node and for that reason be readily diagnosable This is best exemplified in enlargement of the cervical lymph nodes where the microscopic picture of metastatic carcinoma is readily recognizable from the aspirated material, but where often the primary growth cannot be predicted with certainty, the two most common primary lesions being lymphoepithelioma of the oropharynx and carcinoma of the lung Thus the aspiration biopsy has partly answered the $8 question but poses in turn another question, the answer for which must be sought through the aid of the otolaryngologist in his search for the primary tumor and the radiologist in his study of the lung, approaches which savour of the $64 question and which should not be undertaken until clear indication exists as to their need and after the simpler possibilities first have been exhausted

On the other hand, great diagnostic difficulty might be encountered by the pathologist if the cells are found to be of the lymphocytic series, as aspiration biopsies of primary disease of the lymphoid system carry a definite percentage of diagnostic error even in the hands of the experienced pathologist Thus the clinician might be denied an answer to his $8 question and has to try for the $16 question, namely, the surgical removal of the entire lymph node for pathologic examination in order to make a final diagnosis

The above example illustrates the value of teamwork in the diagnosis of disease and emphasizes the intelligent step-by-step economical method in the use of the laboratory It is a tailor-made approach to the individual diagnostic problem in contrast to the more wasteful and less thoughtful method where "routine" laboratory work is ordered on a patient irrespective of the particular problem For one thing, this latter method makes for a more superficial investigation, as the ordering of routine diagnostic laboratory work savours of the "Let George do it" mental attitude, where the clinician evades

his prime responsibility calling for an analysis of the problem with its consequent tentative diagnostic possibilities, to be sifted and refined by further specific laboratory or clinical examinations, and becomes instead the recipient of a sheaf of laboratory reports from which he tries to abstract information that might be pertinent to the case Apart from the economic wastefulness of this approach, there is the even greater danger of diagnostic error, for conceivably with the use of "routine" laboratory tests, he might have failed to order the one single and less frequently used test that would provide him with the diagnosis

Laboratory studies are thus simply aids in the diagnosis of disease, to be used with forethought and precision if the $64 question is to be answered

Many other situations have a similar import—a woman presents a symptom of vomiting and a gastrointestinal series is ordered rather than asking the question when the last menstrual period occurred Perhaps certain aspects of medical education are at fault, especially in the case of recently graduated residents, by whom a so-called "work-up" has become a routine order Perhaps it would be well to go back to the old teaching of "feel, look, and listen"

Current Editorial Comment

Doctors and the Income Tax Physicians may have overlooked in the United Medical Service Bulletin for April, 1948, the following notice

> *Income Tax Returns* The Collector of Internal Revenue has directed United Medical Service to make report of payments to physicians under the provisions of our contracts The administration of this regulation makes necessary for us to assign a code number for each physician Watch for a communication which will be mailed to you within the next six weeks you are familiar with such reports if you do "compensation" cases A copy of the report which we shall make to the Collector will be mailed to you in January, 1949, reporting 1948 payments to you by UMS

The editors of this JOURNAL again bring it to your attention All physicians will by now have received a key-ring tag with the assigned number which must be used on certificates in claim reports

In this issue, on page 80 will be found a special article "Are Physicians Particularly Suspect of Tax Fraud?" The editors feel that, while the answer is "No," this article is exceptionally informative and may serve to bring to the attention of many physicians deficiencies in the keeping of their office books which may cause their income tax returns to fall under particular scrutiny by the Bureau of Internal Revenue We advise all our readers to study this article carefully and to have it in mind in preparing future tax returns

Physicians' Home The report of the president of the Physicians' Home, Dr Charles Gordon Heyd, at the annual meeting of the organization, held October 19, 1948, at the offices of the State Society, contained the following items of interest Four main types of service are stressed (1) by making cash contributions to the "guests" through the treasurer of the local county medical society where the beneficiary resides, (2) where the doctor and his wife are living together, to provide adequate funds for the maintenance of the home, (3) to provide transportation of "guests" to relatives in distant parts of the United States, and (4) to provide funds for emergencies

The activities of the Home are carried out by a Board of Directors numbering 27 and nominated by the Medical Society of the State of New York The sources of income are from contributing annual members, now 509 in number, voluntary assessment made by State Society members, now amounting to $10,894, bequests by wills and individual donations The receipts for the past year were $26 244, disbursements $14,303, leaving a surplus of $11,940 It was possible to add $6,000 to the capital account A bequest from the estate of Leon F Gurniques, M D , was received

Revised Certificates of Birth, Stillbirth, and Death

Revised forms of birth, stillbirth, and death certificates have been put into use in the State, outside of New York City, beginning January 1, 1949 Local registrars of vital statistics will provide all practicing physicians, hospitals, and undertakers with supplies of appropriate forms, and, when these are received, all of the old forms on hand should be destroyed

The changes in the content and arrangement of the birth and stillbirth certificates were made largely to provide more space for some of the entries and to eliminate sources of ambiguity One item was added (on the face of the stillbirth and on the reverse of the birth certificate) which reads "Was mother's blood tested for Rh factor? Yes ——No—— If yes, was blood Rh^+—— Rh^-—— ?"

The death certificate has also been rearranged and some of the phraseology modified for greater clarity Of special importance is the form of medical certification reproduced below (Table 1), which was adopted by the member countries of the World Health Organization at the conference held in Paris, April 26 to 30, 1948, and their agreement upon a uniform procedure for the tabulation of deaths according to cause

TABLE 1 —MEDICAL CERTIFICATION OF CAUSE OF DEATH

			Interval Between Onset and Death
I	Disease or Condition Directly Leading to Death This does not mean the mode of dying such as heart failure asthenia etc It means the disease injury or complication which caused death	(a)	
		Due to (b)	
	Antecedent Causes Diseases and conditions if any giving rise to the above cause stating the underlying cause last	Due to (c)	
II	Other significant conditions contributing to the death but *not related* to the disease or condition causing death		

This conference also agreed on a uniform procedure for the tabulation of deaths according to cause The problem of classification is simple when only one cause is involved However, in many cases two or more conditions contribute to the death In the past the selection of the "primary" cause was governed largely by statistical rules which differed from country to country The basic consideration from a standpoint of the prevention of deaths is, of course, the disease or condition which initiated the chain of events leading to death In the new procedure the tabulation of deaths will be based, as it should, on the judgment of the certifying physician When his statements are entered in consistent and logical order, the selection of the underlying cause of death will become a matter of simple reference

In the past, the selection of the primary cause was governed largely by statistical rules Since, however, from the point of view of the prevention of deaths, it is basic to determine the underlying cause which initiated the trend of events leading to death, one should in all logic depend upon the judgment of the certifying physician for the answer, and it is this procedure that will now be followed If the physician enters a single cause (under I-a), then the business of classification is simple, if he enters two or more causes, then the one entered last (under I-b or I-c) will be considered as the underlying cause and the death ascribed to it The "other significant conditions" given in II will be used in connection with, but not in place of, the statements given in I, they may permit a refinement of a more generalized statement of the underlying cause

If every physician will bear this fact in mind and make the entries in the medical certification in consistent and logical order, then we may hope that in the forthcoming years the mortality statistics more and more adequately will picture the bodily and mental ailments of the people in terms of current medical science and current medical practice

The President's Page

HAPPY New Year to every member of the Medical Society of the State of New York! The year 1949 can be a joyous one for anyone who carries in his heart the seeds of happiness, good will, and contentment and who nurtures them diligently The medical profession should be a happy profession, because it strives unceasingly for the relief of suffering, not always as successfully as we would wish, but, nevertheless, with sympathy and intelligence This striving is a privilege not accorded to all men, but to a relative few who are willing to travel the long road of learning and discipline toward the goal of greater human health, happiness, and well-being

The medical profession, as it commences the new year, should find joy in the realization of what miracles it has accomplished in the conquest of disease, and pray that, even though there is plenty yet to do, more knowledge and better tools will ever be added with which to do it

Although the Declaration of Independence guarantees to us only the pursuit of happiness, that in itself is a tremendous privilege We have had portions of happiness in our hands for many years, still have them in fact, and the continuing pursuit of it can well be favored by the purposeful adoption of certain attitudes We are happy to be living in one of the greatest countries on this globe—a land of plenty, still a great land of opportunity, and an oasis of peace in a troubled world

The medical profession has been privileged, in this free atmosphere, to develop and grow great in its accomplishments and in its prestige There are greater goals for us still, and our responsibilities will be ever greater

Our responsibilities, our rewards, and our rights and privileges are intimately intertwined Our responsibilities, however, come mainly from within ourselves, while our rights and privileges, although partly inherent to us as citizens, must come, in large measure, from without The responsibilities of the medical profession will continue to be discharged in our traditional manner—by ever improving our technics, by seeking ever higher standards, educational as well as ethical, to the end that the patient, our ultimate object of solicitude, will have the best care in the world Our rewards for service should ever emanate from the pattern handed down by our forebears who did not measure them by fine scales or double entry bookkeeping Their adequacy was assured by giving always twenty ounces to the pound, and by adding charity as flavoring

Our rights and privileges, coming as they do from without, are not ours alone, but belong likewise to our patients It is our duty to protect these rights, not only for ourselves, but for them, and to fight for them with all our strength, for they are fundamental to freedom, and to the preservation of the attitudes and ideals that have made this country of ours unique in history

We know that, as a result of his education and training, the doctor is psychologically conditioned to heal His greatest satisfaction lies first and foremost in healing The will to heal becomes part of him On the other hand, there is developed in the patient, who has freedom, individual responsibility, and rewards, the will to get well Bring these forces together—the will to heal and the will to get well—and you have the power that has made American medicine great

Take away, under bureaucratic supervision and control, the will to heal, and take away with liberty, the will to get well, and replace it with the will to malinger—and the result is government medicine The latter would be the ultimate in disaster to the patient, and it is our duty to bring this fact home to him We must do our part to prevent it happening

DEVELOPMENTS IN PUBLIC HEALTH

Revised Certificates of Birth, Stillbirth, and Death

Revised forms of birth, stillbirth, and death certificates have been put into use in the State, outside of New York City, beginning January 1, 1949 Local registrars of vital statistics will provide all practicing physicians, hospitals, and undertakers with supplies of appropriate forms, and, when these are received, all of the old forms on hand should be destroyed

The changes in the content and arrangement of the birth and stillbirth certificates were made largely to provide more space for some of the entries and to eliminate sources of ambiguity One item was added (on the face of the stillbirth and on the reverse of the birth certificate) which reads "Was mother's blood tested for Rh factor? Yes ____No____ If yes, was blood Rh+____ Rh−____?"

The death certificate has also been rearranged and some of the phraseology modified for greater clarity Of special importance is the form of medical certification reproduced below (Table 1), which was adopted by the member countries of the World Health Organization at the conference held in Paris, April 26 to 30, 1948, and their agreement upon a uniform procedure for the tabulation of deaths according to cause

TABLE 1—MEDICAL CERTIFICATION OF CAUSE OF DEATH

		Interval Between Onset and Death
I. Disease or Condition Directly Leading to Death. This does not mean the mode of dying such as heart failure asthenia, etc. It means the disease injury or complication which caused death.	(a)	
	Due to (b)	
Antecedent Causes Diseases and conditions, if any giving rise to the above cause stating the underlying cause last	Due to (c)	
II Other significant conditions contributing to the death but *not related* to the disease or condition causing death.		

This conference also agreed on a uniform procedure for the tabulation of deaths according to cause The problem of classification is simple when only one cause is involved. However, in many cases two or more conditions contribute to the death. In the past the selection of the "primary" cause was governed largely by statistical rules which differed from country to country The basic consideration from a standpoint of the prevention of deaths is, of course, the disease or condition which initiated the chain of events leading to death. In the new procedure the tabulation of deaths will be based, as it should, on the judgment of the certifying physician When his statements are entered in consistent and logical order, the selection of the underlying cause of death will become a matter of simple reference.

In the past, the selection of the primary cause was governed largely by statistical rules Since, however, from the point of view of the prevention of deaths, it is best to determine the underlying cause which initiated the trend of events leading to death one should in all logic depend upon the judgment of the certifying physician for the answer, and it is this procedure that will now be followed. If the physician enters a single cause (under I-a), then the business of classification is simple, if he enters two or more causes, then the one entered last (under I-b or I-c) will be considered as the underlying cause and the death ascribed to it The "other significant conditions" given in II will be used in connection with, but not in place of, the statements given in I, they may permit a refinement of a more generalized statement of the underlying cause.

If every physician will bear this fact in mind and make the entries in the medical certification in consistent and logical order then we may hope that in the forthcoming years the mortality statistics more and more adequately will picture the bodily and mental ailments of the people in terms of current medical science and current medical practice

FACTS ABOUT NUTRITION

Norman S Moore, M D , Editor

A New Approach to the Rheumatic Fever Problem

At this time of year, when recurrences of rheumatic fever begin to appear in larger numbers, physicians again review what measures may be adopted to reduce the incidence of recurrence of rheumatic fever among their rheumatic patients During the last decade hopes have been high at times, only to fall on realization of the dangers of the methods advocated *It is the purpose of this* page again to give hope to the physician whose chief aim is prevention of rheumatic recurrences, for he knows that severe cardiac damage is the result of repeated rheumatic relapses

Along the road travelled in the search for the cause and prevention of rheumatic fever there have been many discards, but significant milestones remain The first of these was the fact that the hemolytic streptococcus in all likelihood played some part in the development of the disease [1,2] This led to attempts, through isolation or chemotherapy, to prevent streptococcal infections in patients who had recovered from one or more attacks of rheumatic infection

Beginning in 1939 another milestone was passed when the effectiveness of prolonged sulfonamide administration in preventing the disease through control of group A hemolytic streptococcal infections was demonstrated [3,4] However, the reports of the toxicity of sulfonamide drugs, together with the warning of Rich of possible sensitization which could result in development of periarteritis nodosa, dampened the enthusiasm of many clinicians and undoubtedly will restrain many others until the risks are clarified [5,6] In addition, the demonstration of definite evidence of a sulfonamide resistant strain of group A hemolytic streptococci, appearing during the course of sulfadiazine prophylaxis at a large naval training station, was cause for some loss of confidence in the method [7]

Fortunately, other milestones appear on the road which offer hope of replacing those lost through the toxicity of sulfonamide drugs These are the effects of environmental living conditions on the course of the disease Taran, in a 1941 report, pointed out that many factors in the living conditions were important in that they could vitiate the improvement made during convalescent carditis [8] He divided living conditions into three groups—(*a*) good—where there was an adequate budget, a well-balanced diet, ample clothing in winter, sensible maternal care, and dry sunny sleeping quarters, (*b*) fair—where two of the above factors were lacking, and (*c*) poor—in which three or more factors were lacking In a careful study of recurrence rates only one eighth of group (*a*) had recurrences, one fifth of (*b*), but one half of group (*c*) The incidence of rheumatic recurrence during observation was four times as high in the poor environment as in the good one

It has long been suggested that economic, sociologic, and dietary factors are concerned in some way in the etiology and recurrence of the disease *The above study gives emphasis to that point of view* In 1943 another milestone was reached by Coburn and Moore who gave positive evidence of the relationship between adequacy of diet and the susceptibility of the host to rheumatic fever [9] They were of the opinion that one of three factors in the genesis of the rheumatic state is the conditioning of the host by a poor diet Coburn and Moore's speculations are based on a statistical comparison

The future will disclose dangers—it may be that it is the business of the future to be dangerous We must meet these dangers with honor and integrity The future will see many changes in the distribution of medical care We have had many—none of them catastrophic We must adapt ourselves to change whenever it is necessary for the welfare of the patient Narrow consideration for ourselves will have to be abandoned whenever it is best for him Conditions may change, but principles never

We are facing the new year, and, in spite of all, we have reason to be happy Let us never lose faith in our patients—in the man in the street Our economic destiny may be in his hands I know he can distinguish between gold and dross Our spiritual destiny and our marks of quality, however, are in our own hands So let us have a courageous outlook as we begin the new year!

PRIZE ESSAYS

The Merrit H Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York, May 2, 1949, in Buffalo

The Lucien Howe Prize of $100 will be presented for the best original contribution on some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York.

The Merrit H Cash Prize of $100 will be given to the author of the best original essay on some medical or surgical subject Competition is limited to the members of the Medical Society of the State of New York, who at the time of the competition are residents of New York State.

The following conditions must be observed

Essays shall be typewritten or printed with the name of the prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device The essay shall be accompanied by a sealed envelope having on the outside the same motto or device, and containing the name and address of the writer

If the Committee considers that no essay or contribution is worthy of a prize, it will not be awarded

Any essay that may win a prize automatically becomes the property of the Medical Society of the State of New York "to be published as it may direct"

All essays must be presented not later than February 1, 1949, and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York

A New Approach to the Rheumatic Fever Problem

At this time of year, when recurrences of rheumatic fever begin to appear in larger numbers, physicians again review what measures may be adopted to reduce the incidence of recurrence of rheumatic fever among their rheumatic patients During the last decade hopes have been high at times, only to fall on realization of the dangers of the methods advocated It is the purpose of this page again to give hope to the physician whose chief aim is prevention of rheumatic recurrences, for he knows that severe cardiac damage is the result of repeated rheumatic relapses

Along the road travelled in the search for the cause and prevention of rheumatic fever there have been many discards, but significant milestones remain The first of these was the fact that the hemolytic streptococcus in all likelihood played some part in the development of the disease [1,2] This led to attempts, through isolation or chemotherapy, to prevent streptococcal infections in patients who had recovered from one or more attacks of rheumatic infection

Beginning in 1939 another milestone was passed when the effectiveness of prolonged sulfonamide administration in preventing the disease through control of group A hemolytic streptococcal infections was demonstrated [3,4] However, the reports of the toxicity of sulfonamide drugs, together with the warning of Rich of possible sensitization which could result in development of periarteritis nodosa, dampened the enthusiasm of many clinicians and undoubtedly will restrain many others until the risks are clarified [5,6] In addition, the demonstration of definite evidence of a sulfonamide resistant strain of group A hemolytic streptococci, appearing during the course of sulfadiazine prophylaxis at a large naval training station, was cause for some loss of confidence in the method

Fortunately, other milestones appear on the road which offer hope of replacing those lost through the toxicity of sulfonamide drugs These are the effects of environmental living conditions on the course of the disease Taran, in a 1941 report, pointed out that many factors in the living conditions were important in that they could vitiate the improvement made during convalescent carditis [8] He divided living conditions into three groups—(*a*) good—where there was an adequate budget, a well-balanced diet, ample clothing in winter, sensible maternal care, and dry sunny sleeping quarters, (*b*) fair—where two of the above factors were lacking, and (*c*) poor—in which three or more factors were lacking In a careful study of recurrence rates only one eighth of group (*a*) had recurrences, one fifth of (*b*), but one half of group (*c*) The incidence of rheumatic recurrence during observation was four times as high in the poor environment as in the good one

It has long been suggested that economic, sociologic, and dietary factors are concerned in some way in the etiology and recurrence of the disease The above study gives emphasis to that point of view In 1943 another milestone was reached by Coburn and Moore who gave positive evidence of the relationship between adequacy of diet and the susceptibility of the host to rheumatic fever [9] They were of the opinion that one of three factors in the genesis of the rheumatic state is the conditioning of the host by a poor diet Coburn and Moore's speculations are based on a statistical comparison

of dietary intakes of 50 children, with no rheumatic history, from a private school located in a section of the city where there was a high incidence of the disease, with those of 40 ambulatory rheumatic patients Twenty-five of the latter children appear "more susceptible" because of recrudescence during the two years preceding the study, the remaining group was labeled "less susceptible" because of no recrudescence in two to ten years They found that deficiencies in several dietary factors, notably protein, iron, vitamin A, and possibly calcium and riboflavin, were related to higher susceptibility in the host rather than any single dietary component

The most recent work which supports the concept of Coburn and Moore is the contribution by Jackson *et al* of Iowa [10] They made a careful study of recurrence rates in rheumatic subjects who received special advantage in diet and environmental care but did not receive sulfonamide drugs Included in the study were 266 children who met the requirements of having a certified diagnosis of rheumatic fever Those patients were instructed in the therapy prescribed by the clinic and were under the observation and supervision of the clinic for some time after the disease had become inactive

The age specific recurrence rates of the Iowa-treated group which had careful instruction in adequate diet and good environmental care shows a significant deviation from the natural course of the disease An analysis of recurrences in relation to environmental care indicated that dietary care was the most significant protective factor Social care showed some relationship, but no correlation with economic resources was obtained

Jackson concluded that, if the disease is definitely inactive, an excellent diet plus wholesome living conditions will practically eliminate the chances of recurrence with carditis, and that sulfonamide prophylaxis is not indicated for children recovered from rheumatic fever unless they have definite valvular heart disease or cardiac enlargements and are forced to live in an environment which does not provide a good diet and at least a fair level of general care

The majority of children studied were receiving inadequate diets at the time they developed the attack of rheumatic fever which brought them under observation. The degree of deficiency of the diet was related to the incidence and degree of heart damage The diet as a whole is important, but the most commonly deficient nutrients were protein, vitamin D, thiamin, and the minerals

Jackson points out that rheumatic families who have been helped to provide a high level of environmental care for their children should have fewer siblings who develop the disease, and that among the next generation of children there should be a lower incidence of rheumatic fever

This study indicates that every effort should be made toward improvement of the general living conditions of rheumatic children This involves a different concept of prophylaxis and calls for different skills. It requires much more time, knowledge, and patience to instruct a mother how to care for and feed her child than to instruct her in giving medication Where formerly the physician and his nurse or technician could prescribe chemotherapy for prophylaxis and observe patients for toxicity, planning for proper environmental care and adequate diet for the rheumatic child calls for additional personnel This sociologic approach requires contribution from public health nurses, nutritionists, and medical social workers The role of the physician is broadened further as he becomes more concerned with education His prestige is enhanced through community service and he continues as captain of the team of workers whose objective it is to protect the rheumatic child *Medicine will do well to pause* for thorough exploration of this recent milestone in rheumatic fever control

BACTERIAL FILTRATES AND AUTOGENOUS VACCINES IN THE TREATMENT OF CHRONIC SINUS DISEASE AND OTHER CHRONIC RESPIRATORY AFFECTIONS

Preliminary Report

HUGH M KINGHORN, M D , GEORGE E WILSON, M D , and MORRIS DWORSKI, B S , Saranac Lake, New York

THERE are some conditions of the respiratory system which often do not respond to the usual therapeutic measures, either medical or surgical We have endeavored to treat these intractable conditions with a bacterial filtrate and an autogenous vaccine

The diseases studied and treated by us are as follows

1 Chronic sinus disease and chronic nasal catarrh
2 Patients with cough and expectoration still present after a partially successful pneumothorax treatment or thoracoplastic operation
3 Patients with pulmonary tuberculosis with troublesome cough and sputum and in whom no surgical procedure could be employed
4. Bronchiectasis
5 Allergic bronchitis

Technical Procedures

Preparation of Bacterial Filtrates and Autogenous Vaccines —Cultures by means of swabs are taken from both posterior nares or from the sinuses and are grown as we shall now describe for the preparation of bacterial filtrates and vaccines from sputum

The patient is instructed to have the teeth and mouth as clean as possible The mouth is rinsed with sterile water before expectorating The sputum should be coughed up and not procured simply by clearing the throat, that is, the patient should submit a specimen of sputum which comes from the bronchial tree The morning specimen of sputum is preferable, and the second or third expectoration is apt to be freer from mouth contamination than the first Sterile flasks with large mouths are useful to receive the sputum The specimens are sent as soon as possible to the laboratory and, if the examiner is not there, are put at once into the ice chest If possible, smears from the sputum should be made at the bedside to stain for spirochetes

To obtain cultures, a small amount of selected portion of sputum is washed in four to six changes of sterile 0 85 per cent sodium chloride in Petri dishes The washed particles are streaked on blood agar plates and on Sabouraud's agar and placed in dextrose broth and in thioglycollate broth for anaerobes The following smears are prepared Ziehl-Neelsen, gram, Fontana, and 20 per cent potassium hydroxide hanging drop for mycotic organisms

To obtain the discharges from the sinuses and postnasal spaces, the help of the laryngologist is often necessary The discharges are collected on swabs and are handled as with the sputum, except that washing with salt solution is omitted

At the end of twenty-four or forty-eight hours the cultures are examined The organisms are subcultured and identified Usually, all of the types of organisms grown are utilized in preparing vaccine and bacterial filtrate The following procedure is employed

1 The isolated organisms in pure culture are grown separately in dextrose broth flasks for forty-eight hours at 37 C

2 The growth is then centrifuged for thirty minutes at 3,000 revolutions

3 The supernatant fluids of all cultures are mixed and poured into flasks and saved for the preparation of sterile bacterial filtrate

4 Each bacterial sediment is suspended in salt solution (0 85 per cent) and poured into

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Ophthalmology and Otolaryngology May 21 1948.

separate test tubes containing glass beads The tubes are sealed and shaken by a machine until an even suspension is obtained

5 The shaken suspension is filtered through a cotton filter to remove any clumps

6 The number of organisms in each separate shaken suspension are counted in the hemocytometer (a Hauser-Petroff counting chamber) and usually diluted so that each cubic millliter contains 40 billion organisms From these concentrated suspensions, further dilutions are made, and the various organisms are now mixed

7 The bottles are sealed and heated at 56 C for one hour

8 Sterility tests are made by adding suspension to dextrose infusion broth and incubating for forty-eight hours at 37 C

9 Finally, phenol is added to make a 0 5 per cent solution

Bacterial Filtrate—1 The supernatant fluids of all cultures are mixed and are sterilized by passing through a Seitz bacterial filter

2 Sterility tests are made by incubating the filtered broths for seventy-two hours

3 If sterile, phenol is added to make a 0 5 per cent solution as a preservative

Demonstration of Sensitiveness—To determine whether the patient is sensitive to the vaccines and bacterial filtrate solutions thus prepared, 0 05 cc of vaccine dilution containing 200 million organisms, and 0 05 cc of bacterial filtrate solution are injected intracutaneously into the forearms—vaccine into the right arm, and bacterial filtrate solution into the left arm, and the results observed and recorded in five, ten, and fifteen minutes, and again at the end of twenty-four hours Two reactions may occur an immediate reaction in the first fifteen minutes, characterized by a wheal, often 10 mm in diameter, surrounded by an area of erythema, often 30 to 40 mm or more This reaction is similar to that obtained by horse serum or white of egg in a sensitive patient Measurements of the wheal and of the erythema are recorded These reactions may fade within a few hours and may or may not be followed by a secondary reaction, which resembles a tuberculin reaction, with a swollen red area from 4 to 5 cm in diameter Sometimes one reaction occurs without the other, but either seems to indicate general sensitiveness If there is no wheal or erythema at any time following the test, the patient is probably not sensitive to this particular vaccine or bacterial filtrate solution, and the vaccine and this bacterial filtrate solution will probably be of no value in treatment

Administration—It is advisable to avoid general reactions in the administration of the vaccines and bacterial filtrates Therefore, we give them intracutaneously into the forearms—vaccine into one arm, and bacterial filtrate into the other—and with each successive dose alternate from one to the other arm Fever reactions are thus rare Marked and extensive hyperemia usually follows the injections, especially with the bacterial filtrate solutions The injections should begin with small doses, 0 05 cc of each (both bacterial filtrate and vaccine), and each week the doses can be increased by 0 05 cc until 1 cc of each preparation be reached As mentioned above, the first dose of 0 05 cc vaccine should contain 200 million organisms, or approximately this number One should continue with the bottle of solution containing this dilution until 1 cc. be reached Then a stronger dilution can be used We suggest the use of a tuberculin syringe, Betz Number 226, for giving the injections If a very extensive hyperemia results, the dose may be repeated or reduced If fever results, the dose should be reduced to the amount that failed to produce fever

The injections should be given once a week, and treatment usually continues from four to six months If favorable results occur, they are apparent within six months, and often the improvement may be more or less permanent If the patient should complain of headache, pain in the back, or indefinite pains and aches following a dose, even though there is no fever, the dose should either be repeated or reduced When 0 5 cc of vaccine and bacterial filtrate solution are reached, the following injections should be divided into two amounts, since the skin may not tolerate doses higher than this amount We believe that a better vaccination occurs with the intracutaneous than with the subcutaneous method

In order to determine the effect of the vaccine and bacterial filtrate on the amount of sputum, a careful sputum record should be kept This can be recorded each day on the chart A convenient time to measure the sputum is just before retiring An average of the amounts of twenty-one days can be made and recorded at the end of each chart sheet The sputum can be collected in a glass receptacle through the twenty four hours, and measured in a small 2- or 3-ounce medicine glass The medicine glass should be so graduated that small amounts of sputum, 1/4 or 1/2 dram, can be accurately measured

A complete physical examination should always be made, both on the nasal and lung patients X-ray examinations should also be made on both groups

Part I—Results of Treatment of Chronic Sinus Diseases and Chronic Nasal Catarrh

Preparation of Cultures—Cultures by means of swabs are taken from both posterior nares or from the sinuses and are grown as described in the preparation of cultures from sputum

Method of Treatment—These patients are given their autogenous polyvalent bacterial filtrates and vaccines intradermically The bacterial filtrate solutions are also put directly into the sinuses when necessary and are always applied directly on swabs into the middle nares in the following manner

The bacterial filtrate solution is applied to both nostrils by fully saturated cotton packs to the middle meatus in the region of the hiatus semilunaris, where one finds the openings of the antrum, the anterior ethmoid cells, and the frontal sinus Small packs are also applied to the inferior and middle meatus When we wish to put the bacterial filtrate solution into the antrum, we go either through the natural opening of the antrum in the middle meatus or puncture under the inferior turbinate into the antrum Selection of method depends upon the nature of the case In some persons it is very difficult to enter the antrum by the natural route In either method, however, we anesthetize the region (under the anterior end of the middle turbinate or under the inferior turbinate) with 10 per cent cocaine solution About 2 cc of the bacterial filtrate solution is put into each antrum The treatments are given weekly Each treatment is followed by the usual nasal oil sprays

The types of cases treated with the vaccines and bacterial filtrate solutions were divided into two groups, one the true sinus cases and the other called chronic nasal catarrh A staphylococcus was found in all these nasal patients and might indicate a causal relationship to the offending infection

The chronic sinusitis cases had definite evidence by x-ray examination of sinus disease The chronic cases of nasal catarrh had no positive evidence by x-ray of sinus disease, but we believe that a number of them had chronic sinusitis but were draining well Our classification was based upon the presence or absence of evidence of disease by x-ray

Results—There were 24 nasal cases, 16 with sinus disease and eight with chronic nasal catarrh (Table 1) Of this total number, 21, or 87 5 per cent, were either cured or improved Three patients (12 5 per cent) showed no improvement

Of 16 sinus cases, 13 (81 25 per cent) were either cured or improved, 6 patients, or 37 5 per cent, were cured, and three patients (18 75 per cent) were not improved

Of eight patients with chronic nasal catarrh, all eight (100 per cent) were either improved or cured while three, or 37 5 per cent, were cured

One sinus patient with a Staphylococcus albus became cured Twelve sinus patients with S aureus were either cured or improved, and of these five were cured

All of the patients with chronic nasal catarrh had S aureus

TABLE 1—SUMMARY OF TREATMENT IN SINUS DISEASE AND CHRONIC NASAL CATARRH

Nature of Disease	Number of Cases	Cured and Improved	Cured	Not Improved
Sinus	16	13 (81.25%)	6 (37 5%)	3 (18 75%)
Chronic nasal catarrh	8	8 (100%)	3 (37 5%)	
Total	24	21 (87 5%)	9 (37 5%)	3 (12 5%)

Part II—Results of Treatment of Tuberculous Patients

It has long been known that secondary organisms (mixed infection) are often present in the sputum of patients with pulmonary tuberculosis, especially in the advanced cases with cavity formation It has been thought, however, that this secondary or mixed infection plays a very minor role, and that it is of little or no importance Dr F M Huntoon was one of the first to attempt to determine the significance of this mixed infection from the standpoint of allergy [1] The experience which he gained over a period of two years showed (1) pulmonary tuberculosis patients are often allergic (skin sensitive) to such secondary organisms (2) Such allergy is sometimes accompanied by cough and expectoration not referable to the tuberculous condition (3) Desensitization of such patients is often followed by improvement in sedimentation rate, blood count, and clinical condition (4) A group of organisms often implicated in this connection is the Neisseria gram-negative cocci, previously overlooked or ignored in this connection

Of other workers in this line of research we mention F Maurice McPhedran, E L Lane, and J W Crossen [2] These physicians gave their experiences covering a period of six years Out of the 280 tuberculous patients observed, not less than 30 per cent, including those in all stages of the disease, showed at some time during their course an ability to react to the killed staphylococcus suspensions with unmistakable benefit, both in their symptoms and in their lesions In many of their cases the use of the killed staphylococcus vaccine appeared to be the deciding factor in preventing death or prolonged stalemate Of 142 cases under treatment in 1936 to 1938, staphylococcus vaccine had a striking effect in 20, and in 34 others the ad-

separate test tubes containing glass beads The tubes are sealed and shaken by a machine until an even suspension is obtained

5 The shaken suspension is filtered through a cotton filter to remove any clumps

6 The number of organisms in each separate shaken suspension are counted in the hemocytometer (a Hauser-Petroff counting chamber) and usually diluted so that each cubic milliliter contains 40 billion organisms From these concentrated suspensions, further dilutions are made, and the various organisms are now mixed

7 The bottles are sealed and heated at 56 C for one hour

8 Sterility tests are made by adding suspension to dextrose infusion broth and incubating for forty-eight hours at 37 C

9 Finally, phenol is added to make a 0 5 per cent solution

Bacterial Filtrate—1 The supernatant fluids of all cultures are mixed and are sterilized by passing through a Seitz bacterial filter

2 Sterility tests are made by incubating the filtered broths for seventy-two hours

3 If sterile, phenol is added to make a 0 5 per cent solution as a preservative

Demonstration of Sensitiveness—To determine whether the patient is sensitive to the vaccines and bacterial filtrate solutions thus prepared, 0 05 cc of vaccine dilution containing 200 million organisms, and 0 05 cc of bacterial filtrate solution are injected intracutaneously into the forearms—vaccine into the right arm, and bacterial filtrate solution into the left arm, and the results observed and recorded in five, ten, and fifteen minutes, and again at the end of twenty-four hours Two reactions may occur an immediate reaction in the first fifteen minutes, characterized by a wheal, often 10 mm in diameter, surrounded by an area of erythema, often 30 to 40 mm or more This reaction is similar to that obtained by horse serum or white of egg in a sensitive patient Measurements of the wheal and of the erythema are recorded These reactions may fade within a few hours and may or may not be followed by a secondary reaction, which resembles a tuberculin reaction, with a swollen red area from 4 to 5 cm in diameter Sometimes one reaction occurs without the other, but either seems to indicate general sensitiveness If there is no wheal or erythema at any time following the test, the patient is probably not sensitive to this particular vaccine or bacterial filtrate solution, and the vaccine and this bacterial filtrate solution will probably be of no value in treatment

Administration—It is advisable to avoid general reactions in the administration of the vaccines and bacterial filtrates Therefore, we give them intracutaneously into the forearms—vaccine into one arm, and bacterial filtrate into the other—and with each successive dose alternate from one to the other arm Fever reactions are thus rare Marked and extensive hyperemia usually follows the injections, especially with the bacterial filtrate solutions The injections should begin with small doses, 0 05 cc of each (both bacterial filtrate and vaccine), and each week the doses can be increased by 0 05 cc until 1 cc. of each preparation be reached As mentioned above, the first dose of 0 05 cc vaccine should contain 200 million organisms, or approximately this number One should continue with the bottle of solution containing this dilution until 1 cc. be reached Then a stronger dilution can be used We suggest the use of a tuberculin syringe, Beta Number 226, for giving the injections If a very extensive hyperemia results, the dose may be repeated or reduced If fever results, the dose should be reduced to the amount that failed to produce fever

The injections should be given once a week, and treatment usually continues from four to six months If favorable results occur, they are apparent within six months, and often the improvement may be more or less permanent If the patient should complain of headache, pain in the back, or indefinite pains and aches following a dose, even though there is no fever, the dose should either be repeated or reduced When 0 5 cc of vaccine and bacterial filtrate solution are reached, the following injections should be divided into two amounts, since the skin may not tolerate doses higher than this amount We believe that a better vaccination occurs with the intracutaneous than with the subcutaneous method

In order to determine the effect of the vaccine and bacterial filtrate on the amount of sputum, a careful sputum record should be kept This can be recorded each day on the chart A convenient time to measure the sputum is just before retiring An average of the amounts of twenty-one days can be made and recorded at the end of each chart sheet The sputum can be collected in a glass receptacle through the twenty four hours, and measured in a small 2- or 3-ounce medicine glass The medicine glass should be so graduated that small amounts of sputum, 1/4 or 1/2 dram, can be accurately measured

A complete physical examination should always be made, both on the nasal and lung patients X-ray examinations should also be made on both groups

field intimately related to his own His long experience at Trudeau Sanitarium has allowed him to observe and to evaluate the different kinds of treatment for tuberculosis

In the treatment of chronic sinus disease of the polypoid obstructive type and the suppurative type, little progress was made until radical surgery was employed This was accomplished by the pioneers in sinus surgery Dr John E Mackenty advocated and taught these principles, and his students have followed them It was in the follow-up treatment of the suppurative operated cases that the autogenous vaccine found its practical application, and good results were obtained In the early cases, some men employed the autogenous vaccine, combined with daily irrigation, with great benefit to the patient Dr Mackenty was outstanding because he did radical surgery He favored the use of autogenous vaccines in the aftercare, but his thorough surgery was foundational It is doubtful that he had opportunity to apply bacteriophage

As already explained, the preparation of bacteriophage is most meticulous and time-consuming It has been used in the liquid and dry form, the latter was first prepared by Professor Sergienko, but since 1937 little use has been made of the dry type owing to the difficulties of preparation The literature shows that the application in the liquid form has been largely directed against cholera, typhoid, paratyphoid, dysentery, tetanus, and staphylococcic infections In the treatment of wounds it has been shown to have great value applied locally in wet dressings

Dr Truman B Rice of Indiana University states "Striking results are reported in the treatment of dysentery, typhoid fever, and colon bacillus infection Whatever may be finally decided concerning the above diseases, it is generally conceded that the treatment of staphylococcus lesions, by local application of antistaphylococcus bacteriophage filtrates is well established" Professor Rice reported a highly successful series of 300 such cases He believes the bacteriophage filtrates are best applied locally in the form of a wet dressing or injected near the lesion

There has been considerable argument as to the manner in which bacteriophage is effective against disease D'Herelle, a pioneer worker, holds to the original view, that the bacteriophage parasitizes the infecting organisms and in this way brings the infection to an end by destroying the aggravating agent

Much has been written on the different theories as to the nature of bacteriophage, but the literature is limited on the therapeutic application of bacteriophage This is understandable owing to the long, technical processes in its preparation and is doubtless the explanation why so few laboratory workers have employed it

Dr Kinghorn and his coworkers have reported some brilliant results covering five topics, my remarks are confined to topic one, namely, chronic sinus disease and chronic nasal catarrh They have taken advantage of a technic not formerly employed to my knowledge, namely, combining autogenous vaccine and bacteriophage A staphylococcus was found in all their nasal cases which they mention as a possible causal factor in the offending infection

In their series of 22 nasal cases (14 chronic sinus and eight chronic nasal catarrh), very impressive results are tabulated A recent survey of the literature shows nothing comparable to this research

This report is positive evidence of the role played by staphylococcus in chronic sinus and chronic nasal disease and of the destructive action of bacteriophage upon staphylococcus infections

Again quoting Rice, "He believes that bacteriophage filtrates are a valuable addition to the armamentarium of the physician in the treatment of certain suppurative lesions, provided they are properly made and used"

In summarizing, special mention should be made of certain outstanding cases in Dr Kinghorn's series which establish the merit of this technic

There is no doubt about these results, they are convincing, and they offer another valuable method of treatment which is a challenge to workers in sinus disease and nasal catarrh It must be accepted that only the best laboratory facilities and the most patient investigators can duplicate these results

ADDRESSES STATE EXECUTIVES OF WOMAN'S AUXILIARY

In an address before state executives of the Woman's Auxiliary of the American Medical Association in Chicago recently, William F Doscher, assistant director of A.M.A public relations outlined three important PR objectives which face the Woman's Auxiliary in every state They are

"1 Know and define the public relations issues confronting your state medical society, and relate these issues to your Auxiliary program activity

"2 After consultation and agreement with your state medical society's advisory council, your auxiliary should choose its targets for the year and follow through in developing sound public relations activities

"3 Woman's auxiliary public relations is YOU, the public relations program of your state auxiliary is yourself in the final analysis."—*Secretary's Letter, 1 M A , November 8, 1948*

vantage gained was unmistakable but could not be maintained long enough to control the entire course of the disease Thus, in 38 per cent of the 142 cases there was unmistakable improvement and in 14 per cent a striking improvement

Organisms Present in the Sputum —All of the lung cases that were studied showed a mixed infection and had one or several types of streptococci, except for one patient who had a pneumococcus and a gram-negative bacillus

We are unable to say that any particular organism or combination of organisms produced the immense improvement which occurred in some of these persons All of the patients with pulmonary tuberculosis had far advanced disease, and were not suitable for any other form of treatment Some of them were seemingly hopeless, and these are included in our results Our cases were, therefore, not chosen ones They were given vaccine and bacterial filtrate treatment because nothing else could be done for them

Eight of the 20 patients suffering from far-advanced pulmonary tuberculosis had no tubercle bacilli in the sputum when the vaccines were made In all of them, however, tubercle bacilli had been present previously In some of the patients the cavities had cleaned out, and were not shedding tubercle bacilli, and the other patients had lost the tubercle bacilli due to a partially successful pneumothorax treatment or thoracoplastic operation

Follow-up, One to Thirteen Years (Table 2) — Of five patients with far-advanced pulmonary tuberculosis who improved immensely with autogenous polyvalent vaccines and bacterial filtrates, four are living and well (80 per cent) One other patient is dead (20 per cent) One other patient has improved immensely but is still under treatment

TABLE 2 —SUMMARY OF TREATMENT IN PULMONARY DISEASES

Nature of Disease	Number of Cases	Improved	Unimproved	Per Cent Improved
Bronchiectasis	1	0	1	
Allergic bronchitis	2	2	0	100
Far-advanced pulmonary tuberculosis	20	6	14	30

This summary shows that there was no improvement in the patient with bronchiectasis that the two patients with allergic bronchitis improved that 6 of 20 (30 per cent) patients with far advanced pulmonary tuberculosis improved and that these tuberculosis patients improved immensely

Of 14 patients who did not improve with this treatment, six are living (42 85 per cent), and eight are dead (57 1 per cent)

Summary

Autogenous bacterial filtrates and vaccines were given to 47 patients suffering from various chronic respiratory conditions Twenty-three of these patients had lung diseases, and 24 had chronic nasal and accessory sinus troubles Of the 23 lung diseases, one was bronchiectasis, two were chronic allergic bronchitis, and 20 were far-advanced pulmonary tuberculosis The patient with bronchiectasis did not improve, the two patients with chronic allergic bronchitis improved immensely, and six, or 30 per cent, of the 20 patients with far-advanced pulmonary tuberculosis improved immensely

Of the 16 sinus cases, six, 37 5 per cent, were cured, 13 (81 25 per cent) were improved or cured, and three were unimproved (18 75 per cent)

Of the eight patients with chronic nasal catarrh, eight, or 100 per cent, were improved, or cured and three were cured, 37 5 per cent

Of the 24 sinus and nasal cases, Staphylococcus aureus was present in all of the patients

Discussion

F Howard Westcott, M D , *New York City*— I am in no position to confirm or refute the findings of Doctor Kinghorn's report In my opinion, the work was carried out in a truly scientific way, and I am glad to accept his results until the cases I am studying, following his technic, indicate otherwise I would, therefore, like to confine my remarks to the rationale of vaccine-phage-filtrate therapy in these upper respiratory diseases

A bacteriophage is a filtrate containing a specific lytic substance and also distinct endo- and exotoxic antigenic properties This it has in common with other simple filtrates of exotoxic bacteria The phage itself is filterable through bacteria retaining filters, and is considered by many as a virus and by others as an inanimate We know it can only be grown in living bacterial cultures

A vaccine contains bacterial proteins and tissues with its endotoxic antigenic property It may also retain some small amount of exotoxic substance

A toxoid is a modified form of exotoxic filtrate and, therefore, more like a phage than like a vaccine

Skin tests with vaccines are very disappointing, and most allergy clinics have discontinued their routine use Skin tests with phages have not been extensively reported and in my experience in the past ten years have not been indicative of the value of phages' clinical use I found many negatives in autogenous preparations

I would conclude by suggesting that

1 This technic be tried by others for treatment of chronic recurring upper respiratory diseases

2 Skin tests not be used as a criterion of the value of any given vaccine or filtrate therapy, and

3 End results be the guide as to their form of therapy usefulness

Edmonde D Neer, M D , *New York City*—Dr Kinghorn now has made a definite contribution to a

by the ordeal of undergoing an eye operation under local anesthesia * In anticipating how his patient will react, the operator must be guided by his intuition and appraisal of the psychosomatic makeup of the individual as a whole [5] If a dangerous rise in blood pressure is apprehended, the surgeon may institute more energetic measures to anticipate it These will include larger doses of sedatives over a longer preoperative period, the use of vasodilators and other drugs directed toward an immediate and transient lowering of the blood pressure, and possibly phlebotomy

In the series of cases here reported, there was no instance of expulsive hemorrhage, and the one case showing persistent and troublesome postoperative intraocular bleeding showed no rise in systolic pressure and only a ten point rise in diastolic pressure during operation Nevertheless, the danger of expulsive hemorrhage or cerebral accident due to heightened systolic blood pressure is a risk which no surgeon contemplates with equanimity

Many studies have been reported showing that a fall in blood pressure usually accompanies deep general anesthesia [6–8] The disadvantage of general anesthesia for eye surgery is principally the liability to restlessness during the periods of induction and recovery However, not all the anesthetic agents are equally productive of restlessness For eye operations under general anesthesia, most anesthetists prefer to use either intravenous anesthesia or a combination of avertin with nitrous oxide or one of the other gases The author's own experience with intravenous anesthesia is that it is satisfactory for all eye surgery except cataract extractions, for the latter, it is unsatisfactory because relaxation is generally not sufficient (even with a retrobulbar injection) to abolish all muscular contraction, and there may be consequent loss of vitreous The most competent anesthetists feel that with this anesthetic, if sufficient is given to induce complete muscular relaxation, the margin of safety is too small.

Wilmer in 1930 reported satisfactory experience with avertin by rectum, used either alone or in combination with other anesthetics, for eye surgery [9] In the author's experience, avertin as a basal anesthetic induces unconsciousness with a minimum of restlessness, and for cataract surgery complete relaxation is achieved by the additional administration of nitrous oxide during the critical stage of making the section and delivering the lens Sutures are, of course, employed, and no complications have resulted from the occasional minimal restlessness which may be present during recovery In many patients the opium derivatives must be avoided because of their not infrequent tendency to cause excitement or nausea

Case Report

E M , seventy-six-year-old man, was admitted to Queens General Hospital on February 15, 1944, for extraction of a mature senile cataract The patient was an apparently healthy, normally vigorous, old man with blood pressure on admission of 152/78 On February 16, he received preoperatively phenobarbital, 2½ grains and sodium allurate, 1¼ grains Four per cent cocaine was used for conjunctival instillation He had a retrobulbar injection of novocain with adrenalin, the lids were blocked with novocain and adrenalin, and 4 mm of 4 per cent cocaine were injected subconjunctivally The operation was begun, but shortly after the placing of sutures and making the section, the patient ceased to respond to directions, and breathing became labored The operation was completed rapidly, the patient was found to be definitely unconscious and began to manifest slight twitchings of the extremities The blood pressure was 220/140 Sedatives were administered intravenously Twenty-four hours later the temperature was 104 6 F , blood pressure 130/70, there was definite left-sided muscular weakness Thirty-nine hours after operation, the patient died

This was apparently a cerebral accident induced by the rise in blood pressure associated with an eye operation under local anesthesia One wonders whether this man might not be alive today had his cataract extraction been performed under general rather than local anesthesia.

Discussion

George Edgar Burford, M D , *New York City* — Doctor Frey's paper brings out the following points

1 There is a moderate elevation of systolic, diastolic, and pulse pressures

2 In about 6 per cent of patients there is a sharp elevation of systolic and diastolic pressure

3 Apparently no predictable effect on the blood pressure can be correlated with such miscellaneous factors as age, race, sex, or the use of retrobulbar injections or epinephrine

Doctor Frey suggests that a larger proportion of these patients might do well and that a selected few would definitely be better off operated upon under general anesthesia

The elevation of systolic, diastolic, and pulse pressures were not so striking as might have been anticipated Physiologists say that a change of 10 per cent is necessary in order to indicate a definite trend That is what happened in this series

The most interesting point to me concerning these studies was the fact that slightly more than 6 per cent of these patients showed sharp elevations in systolic pressure These averaged more than 60

* Cold pressor tests were carried out on a series of patients in the Eye Wards at St Luke's Hospital in 1943 in an attempt to determine whether the results would afford any criterion for assessing the vasolability of the individuals tested It was hoped that the findings would give some index of the patient's blood pressure reactions on the operating table but the findings were utterly bizarre and no correlation could be established with the subsequent systolic and pulse pressure changes occurring while the patients were undergoing eye surgery under local anesthesia The tests were therefore discontinued.

BLOOD PRESSURE REACTION OF PATIENTS UNDERGOING EYE OPERATIONS UNDER LOCAL ANESTHESIA

W Guernsey Frey, M D , New York City

THE many advantages of local anesthesia in ophthalmic surgery are generally conceded Nevertheless, the fear and excitement experienced by a patient undergoing an operation on the eye while fully conscious may cause severe blood pressure changes, as well as nervous reactions [1-4]

A study was made of the blood pressure reactions of 111 unselected patients undergoing eye surgery under local anesthesia in three New York hospitals, the blood pressure of the individual at rest being compared with the reading taken while the operation was in progress In the series, four cases were from St Luke's Hospital, 18 were from Queens General Hospital, Jamaica, Long Island, and all the others were from the Manhattan Eye, Ear and Throat Hospital The patients were operated on by 18 different surgeons, including nine residents, the blood pressure readings were made by various interns, residents, and anesthetists In eight cases, there was a fall in systolic pressure, in 95 cases, a rise The average rise in systolic pressure for the entire series was 16 mm of mercury The diastolic pressures showed no such uniformity of reaction, both increases and falls being noted, with an average rise of 2 3 mm There was, therefore, an average increase of pulse pressure of 13 7 mm of mercury (The average resting systolic blood pressure was 145 5 mm , and the average pressure during operation was 161 5 mm) The average diastolic figures were 86 7 and 89, respectively The extreme rises were 90 systolic and 75 pulse pressure (in different individuals), and the greatest falls were 40 systolic and 10 pulse pressure

In the series there were 51 men and 60 women, there were representatives of the many races and nationalities seen in New York clinics, including Negroes, Jews, Italians, Russians, Irish, Latin Americans, Scandinavians, and native-born whites It may be said that neither sex nor race was a factor in the blood pressure reactions

All cases received preliminary sedative medication for the intraocular operations—phenobarbital, sodium pentobarbital, or codeine (or combinations) by mouth, for the extraocular operations—pontopan or morphine by hypodermic Codeine, 1 grain, and phenobarbital, 3 grains, were given to more than half of the series, including those subsequently showing the greatest and the least changes in blood pressure In this statistical study it appeared that the preoperative medication played no predictable part in influencing the blood pressure reactions

For the patients with the highest blood pressure preoperatively, either the retrobulbar injection was omitted, or it was given without adrenalin The seven patients showing the highest rise in systolic pressure during operation (averaging 63 4 points) averaged sixty and seven-tenths years of age, of these seven, four had retrobulbar injections with adrenalin, one had a retrobulbar injection without adrenalin, and two had no retrobulbar injection The eight patients showing a fall in systolic pressure during operation (averaging 13 25 points) averaged sixty-two years of age, of these, three had retrobulbar injections with adrenalin Here again it was impossible to feel that the presence or absence of adrenalin or the action of the retrobulbar injection played any part in increasing the blood pressure during operation

The above findings would also suggest that the age of the patient was not a factor, but analysis of the statistics shows that the 31 patients over seventy years of age (averaging seventy-five) did show average systolic rises during operation of 21 points, this being five points above the average for the entire series The average age for the series was sixty years

Studying the figures further, we find that for the cataract cases, constituting somewhat more than half the series, there was an average increase of systolic pressure of 19 9 mm and of pulse pressure of 16 mm For the other long intraocular operations the averages were 18 5 and 15 4 For the short intraocular and the extraocular operations, the average figures for systolic rise and pulse pressure rise were 10 3 mm and 6 4 mm, respectively

We find, then, that patients undergoing eye operations under local anesthesia have an average rise in systolic blood pressure during operation of 16 mm of mercury, that the operations accompanied by the least average rise in systolic blood pressure are the extraocular operations and the short intraocular operations, such as iridectomies, and that in older patients, as might be expected, blood pressure rises are greater Beyond that, sex, nationality, and resting blood pressure are in themselves no indication as to how the blood pressure of a given individual will be affected

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Ophthalmology and Otolaryngology May 20 1948

by the ordeal of undergoing an eye operation under local anesthesia.* In anticipating how his patient will react, the operator must be guided by his intuition and appraisal of the psychosomatic makeup of the individual as a whole.[5] If a dangerous rise in blood pressure is apprehended, the surgeon may institute more energetic measures to anticipate it. These will include larger doses of sedatives over a longer preoperative period, the use of vasodilators and other drugs directed toward an immediate and transient lowering of the blood pressure, and possibly phlebotomy.

In the series of cases here reported, there was no instance of expulsive hemorrhage, and the one case showing persistent and troublesome postoperative intraocular bleeding showed no rise in systolic pressure and only a ten point rise in diastolic pressure during operation. Nevertheless, the danger of expulsive hemorrhage or cerebral accident due to heightened systolic blood pressure is a risk which no surgeon contemplates with equanimity.

Many studies have been reported showing that a fall in blood pressure usually accompanies deep general anesthesia.[6-8] The disadvantage of general anesthesia for eye surgery is principally the liability to restlessness during the periods of induction and recovery. However, not all the anesthetic agents are equally productive of restlessness. For eye operations under general anesthesia, most anesthetists prefer to use either intravenous anesthesia or a combination of avertin with nitrous oxide or one of the other gases. The [illegible]'s own experience with intravenous anesthesia with administration of nitrous oxide during the critical stage of making the section and delivering the lens. Sutures are, of course, employed, and no complications have resulted from the occasional minimal restlessness which may be present during recovery. In many patients the opium derivatives must be avoided because of their not infrequent tendency to cause excitement or nausea.

Case Report

E. M., seventy-six-year-old man, was admitted to Queens General Hospital on February 15, 1944, for extraction of a mature senile cataract. The patient was an apparently healthy, normally vigorous, old man with blood pressure on admission of 152/78. On February 16, he received preoperatively phenobarbital, 2½ grains, and sodium allurate, 1¼ grains. Four per cent cocaine was used for conjunctival instillation. He had a retrobulbar injection of novocain with adrenalin, the lids were blocked with novocain and adrenalin, and 4 mm. of 4 per cent cocaine were injected subconjunctivally. The operation was begun, but shortly after the placing of sutures and making the section, the patient ceased to respond to directions, and breathing became labored. The operation was completed rapidly, the patient was found to be definitely unconscious and began to manifest slight twitchings of the extremities. The blood pressure was 220/140. Sedatives were administered intravenously. Twenty-four hours later the temperature was 104.6 F., blood pressure 130/70, there was definite left-sided muscular weakness. Thirty-nine hours after operation, the patient died.

This was apparently a cerebral accident induced by the rise in blood pressure associated with an eye operation under local anesthesia. One wonders whether this man might not be alive today had his cataract extraction been performed under general

BLOOD PRESSURE REACTION OF PATIENTS UNDERGOING EYE OPERATIONS UNDER LOCAL ANESTHESIA

W GUERNSEY FREY, M D , New York City

THE many advantages of local anesthesia in ophthalmic surgery are generally conceded Nevertheless, the fear and excitement experienced by a patient undergoing an operation on the eye while fully conscious may cause severe blood pressure changes, as well as nervous reactions [1-4]

A study was made of the blood pressure reactions of 111 unselected patients undergoing eye surgery under local anesthesia in three New York hospitals, the blood pressure of the individual at rest being compared with the reading taken while the operation was in progress In the series, four cases were from St Luke's Hospital, 18 were from Queens General Hospital, Jamaica, Long Island, and all the others were from the Manhattan Eye, Ear and Throat Hospital The patients were operated on by 18 different surgeons, including nine residents, the blood pressure readings were made by various interns, residents, and anesthetists In eight cases, there was a fall in systolic pressure, in 95 cases, a rise The average rise in systolic pressure for the entire series was 16 mm of mercury The diastolic pressures showed no such uniformity of reaction, both increases and falls being noted, with an average rise of 2 3 mm There was, therefore, an average increase of pulse pressure of 13 7 mm of mercury (The average resting systolic blood pressure was 145 5 mm , and the average pressure during operation was 161 5 mm) The average diastolic figures were 86 7 and 89, respectively The extreme rises were 90 systolic and 75 pulse pressure (in different individuals), and the greatest falls were 40 systolic and 10 pulse pressure

In the series there were 51 men and 60 women, there were representatives of the many races and nationalities seen in New York clinics, including Negroes, Jews, Italians, Russians, Irish, Latin Americans, Scandinavians, and native-born whites It may be said that neither sex nor race was a factor in the blood pressure reactions

All cases received preliminary sedative medication for the intraocular operations—phenobarbital, sodium pentobarbital, or codeine (or combinations) by mouth, for the extraocular operations—pontopan or morphine by hypodermic Codeine, 1 gram, and phenobarbital, 3 grains, were given to more than half of the series, including those subsequently showing the greatest and the least changes in blood pressure In this statistical study it appeared that the preoperative medication played no predictable part in influencing the blood pressure reactions

For the patients with the highest blood pressure preoperatively, either the retrobulbar injection was omitted, or it was given without adrenalin The seven patients showing the highest rise in systolic pressure during operation (averaging 63 4 points) averaged sixty and seven tenths years of age, of these seven, four had retrobulbar injections with adrenalin, one had a retrobulbar injection without adrenalin, and two had no retrobulbar injection The eight patients showing a fall in systolic pressure during operation (averaging 13 25 points) averaged sixty-two years of age, of these, three had retrobulbar injections with adrenalin Here again it was impossible to feel that the presence or absence of adrenalin or the action of the retrobulbar injection played any part in increasing the blood pressure during operation

The above findings would also suggest that the age of the patient was not a factor, but analysis of the statistics shows that the 31 patients over seventy years of age (averaging seventy-five) did show average systolic rises during operation of 21 points, this being five points above the average for the entire series The average age for the series was sixty years

Studying the figures further, we find that for the cataract cases, constituting somewhat more than half the series, there was an average increase of systolic pressure of 19 9 mm and of pulse pressure of 16 mm For the other long intraocular operations the averages were 18 5 and 15 4 For the short intraocular and the extraocular operations, the average figures for systolic rise and pulse pressure rise were 10 3 mm and 6 4 mm., respectively

We find, then, that patients undergoing eye operations under local anesthesia have an average rise in systolic blood pressure during operation of 16 mm of mercury, that the operations accompanied by the least average rise in systolic blood pressure are the extraocular operations and the short intraocular operations, such as iridectomies, and that in older patients, as might be expected, blood pressure rises are greater Beyond that, sex, nationality, and resting blood pressure are in themselves no indication as to how the blood pressure of a given individual will be affected

RECONSTRUCTION OF THE THUMB

WALTER C GRAHAM, M D , Santa Barbara, California, and DANIEL RIORDAN, M D , Nashville, Tennessee

IT IS interesting to note that of all mammals, only the primates have opposable thumbs In all other groups, the thumb is either absent or rudimentary in character Fingers may be very nimble, but grasp is accomplished by opposing against a pad in the palm of the hand A very definite advantage of a primate thumb, particularly in man, is the ability to grasp between the the thumb and fingers in a position well away from the palm of the hand This single ability tremendously increases the possibility of detailed and refined activities In removing detailed activities from the palm, the thumb is as important to the hand as the arm is in removing the hand from the body

In a recent contribution, Slocum and Pratt attempted to estimate the various functions of parts of the hand [1] They feel that the thumb is 40 per cent of the entire hand They arrived at this figure by considering it as 50 per cent of the ability to grasp and pinch The value of sensation to the usefulness of a hand is also estimated at a total of 50 per cent It is very evident that a thumb without sensation is of extremely limited value In view of the above values, when one considers the possibilities of the various methods of reconstructing a thumb, it is obvious that a surgeon must always have in mind the sensory capacity of the part

Ideally, the new thumb should have sensation comparable to the other fingers of the hand, naturally this includes the stereognosis and proprioception One must also be able to maintain the constructed thumb in a position of function This includes two very essential details—the ability to oppose and adequate muscle control to maintain the opposed position against stress

There are four methods of reconstructing a thumb, which depend upon conditions present in the remaining portion of the hand The first and simplest is that of deepening the web between the thumb and the palm of the hand This is particularly useful in mangled hands where there is loss of the fingers and the thumb, or a tremendous shortening of the digits A progression of the above cleft ing is carried out in phalangization of the metacarpals As a rule, only two metacarpals are phalangized, and to many hand surgeons this seems adequate There are cases reported in which all five metacarpals have been phalangized, but this seemingly inhibits rather than promotes function

The second, and probably most frequent method of restoring a lost thumb, is that of constructing a tube pedicle on the abdomen and transplanting it to the site of the proposed thumb Of course the extensiveness of this procedure is dependent upon the site of amputation

The third, and rather popular but more difficult method, is pollicization of the index finger to replace the missing thumb

The fourth method is that of replacing the thumb with a digit from the opposite hand or with a toe The above methods and their indications will be considered individually

The most frequent total loss of the thumb and fingers occurs in severe frostbites It is less commonly found in congenital deformities, severe burns, and in severe crushing wounds A hand of this type has no more function than that of a forefoot of a dog or bear These animals are limited in picking up and rolling objects between the paws In this type of hand there are excellent possibilities for producing a grasping and pinching member

A cleft ing operation between the first and third metacarpals with removal of the second can be performed and a skin flap with sensation turned over the raw areas where contact will be made The advantage of this procedure compared to split skin grafts in the contact areas is readily realized, as sensation is maintained and the skin is much more resistant to trauma A few surgeons advocate removing the second and third metacarpals to give a wider base to the cleft As the first metacarpal is considerably shorter than the others, lengthening it is definitely advantageous

We have found that a very convenient method of lengthening the first metacarpal is to transplant the distal half of the second metacarpal onto the stump of the first This bone is allowed to unite in moderate valgus, thus placing the tip of the thumb in better position for closer proximity to the remainder of the hand When the hand is clefted, the intrinsic muscles are kept with the first metacarpal so that the power of grasp will be increased The long flexor tendon of the thumb is also attached to the first metacarpal to increase the abduction power We have found this pro-

mm of mercury Such a reaction on the part of the patient must necessarily enter into the surgeon's calculations about the success of his operation and even the safety of his patient

It is, of course, difficult to predetermine which one is going to show this substantial elevation A method of selecting these people would be most desirable Doctor Frey has brought out the difficulty of making this selection I might suggest that the individual who is sure that he cannot stand an operation under local anesthesia and tells you so should be listened to carefully and frequently heeded

Another type is the one who already shows a high, resting blood pressure Doctor Frey has brought out that these individuals do not necessarily show greater elevations of pressure during operation than other members of his series However, an average elevation of pressure starting from a high base may have more serious consequences

It is well to observe most critically the patients being operated upon for cataract These are usually the most serious situations The patient is likely to be older, to have more at stake, and, therefore, to be apprehensive and under tension Many of these people could be better handled under basal followed by general anesthesia

It seems worthy of comment that Doctor Frey found that neither age nor the retrobulbar injection of adrenalin produced any greater elevation in blood pressure than was average for the series It must be remembered, however, in dealing with the more elderly person, that the resting levels are higher and that the vascular system itself is less able to respond satisfactorily to elevations in pressure Therefore, an average rise of pressure in these patients might produce a more unsatisfactory result than one occurring in younger individuals

It was remarkable to me that the use of adrenalin in a retrobulbar injection on the average patient caused no sharp rise in pressure I would urge considerable caution in using this drug We in anesthesia have come to think of adrenalin as a potent and at times dangerous drug When combined with cocaine, even in small amounts, it is capable of producing alarming cardiovascular effects It must be remembered that what we are dealing with is not a group of average patients A sharp elevation in just one patient can produce a serious result It may be significant that the one patient in this series who had serious trouble did receive an injection of epinephrine

When general anesthesia is to be used, some form of basal anesthesia should be first administered. As blood pressure changes are one of the paramount considerations, it is best that the basal anesthesia be given in the patient's room Undoubtedly, the point at which fear and excitement are at the peak is during the approach to the operating room This trial is eliminated by the rapid induction of sleep in the patient's room

For this purpose small doses of avertin are probably best suited In our experience avertin practically always lowers blood pressure *during* the preliminary period before operation and during the first part of the operation This effect with other anesthetics is not as well established It is debatable whether this lowering of blood pressure is a good thing under ordinary circumstances However, in this instance it appears to be a specific beneficial effect

LIFE INSURANCE MEDICAL RESEARCH FUND

The Life Insurance Medical Research Fund organized in 1945 by a group of United States and Canadian life insurance companies, with Dr Francis R Dieuaide as scientific director, has recently issued its third annual report At the beginning of 1947 the Fund was contributing to the support of 51 research programs and 19 research fellows During the year this number was materially increased

Present studies in which the Fund is interested are directed mainly toward the problems of heart disease, so important from the actuarial point of view

Contributions by the life insurance companies to research into the causes of premature death, represent a sound investment on their part. Their profits are increased by human longevity, and, conversely, favorable results in the attainment of longevity should have their favorable effect on insurance premiums It must still be borne in mind, however, lest universal longevity be achieved too rapidly, that the breadth of life may be more important than its length —*New England Journal of Medicine, October 7 1948*

Summary

Various methods and problems in reconstruction of a thumb are considered. The three important factors are maintaining sensation, maintaining the ability to oppose the thumb against the fingers, and having the position of opposition away from the palm when possible.

A satisfactory substitute for a missing thumb can usually be produced by one of the above mentioned procedures.

THE PHYSICIAN AND THE DETECTION OF PRESYMPTOMATIC CANCER

Siegfried W. Wiesno, M.D., Brooklyn, New York

(From the Brooklyn Cancer Institute and the Kings County Hospital)

THANKS to the educational activities of the American Cancer Society the public is gradually becoming aware of the fact that cancer has a much better prognosis if discovered before subjective symptoms appear. Consequently, with increasing frequency persons who consider themselves healthy apply to the physician for cancer detection. Compelled to take a stand in this matter the physician finds himself confronted with a number of questions. Which persons and which organs should be examined? How should the examination be conducted? Which laboratory tests and which specialized studies are essential? At what intervals should the examination be repeated? Who is qualified to perform the examination? If, in search for answers to these questions, the physician consults the current medical literature, he will discover that many of the details of the problems are still in a controversial state. For instance, whereas the editors of the *Journal of the Medical Society of New Jersey* feel that cancer detection examination of apparently healthy people belongs to the general practitioner, a writer from New York maintains that cancer detection in symptom-free persons is no longer a one man job.[1,2] Time will ultimately produce a definite solution of the problems. Meanwhile, the author submits his answers to the profession for consideration.

Persons of any age may harbor malignancy. Science does not possess a generally accepted, simple test to indicate whether malignancy exists in an individual. These two facts would seem to render it imperative to examine periodically every organ of every person from birth on for signs of beginning malignancy. While such a program would represent the ideal, it cannot be carried out with the physicians' time available. Even if the search is confined to the less deep-seated organs, to examine the entire population of the United States once a year would add to every physician's daily activities an average of five hours of strenuous work. Examinations which include every organ or nearly every organ are applicable to a selected few but are out of the question as a large-scale program. For any project that intends to be or, at least, to approach a mass survey, it becomes necessary to limit the search to the age groups with a comparatively high incidence of malignancy and to those organs where malignancy is frequent, easily discoverable, and comparatively easily cured.

Cancer as the cause of death plays an important role in persons over forty years only. The initial stages of these cancers must be detectable at some time prior to death. Therefore, it seems warranted to stipulate that candidates for the cancer detection examinations be thirty-five years and over. While persons under thirty-five years will not be refused (at one of the detection clinics children from one year on are accepted), large-scale surveys of persons younger than this must be dispensed with as long as physicians' time is a factor.

cedure to be extremely gratifying, and the patients are very pleased with the result

In less severe cases where a portion of the fingers remains, a simpler procedure will suffice to give a useful hand If there is total loss of the thumb and loss of all fingers with the exception of the fifth, a simple procedure such as osteotomy of the fifth metacarpal and rotation of the finger into a position for opposition against the stump of the thumb will be extremely useful This gives an excellent position for grasping, and contact is against tissue which still maintains sensation In less severe cases where the ring and middle fingers also remain, an osteotomy of the first metacarpal, bringing the stump of the thumb well over into the center of the hand, will give excellent contact for function

There are many interesting and well-illustrated articles recommending the replacement of a missing thumb with a tube pedicle graft into which a bone graft is inserted for stability The abdomen is usually the source of the pedicle Occasionally, a case is reported in which a compound flap is utilized Generally a portion of the clavicle is incorporated in such a skin flap One of the lower ribs has also been used in this manner The most common sources of bone grafts are the ilium, a portion of the rib, and tibia The revascularization of tibial bone is extremely slow, and there is a tendency for the bone to cause necrosis of the flap We feel that the rib or ilium grafts are more desirable, as they are more easily molded to the desired shape and position The appearance of a reconstructed thumb of this type is usually satisfactory The disadvantage of this procedure is the lack of motion of the distal two joints and inadequate muscular control to place the thumb in proper position for useful function

There are frequent complications encountered which include necrosis of the bone graft, sloughing of the tip of the pedicle, and failure of sensation to extend to the tip of the thumb Of course no stereognosis ever develops, as the special sense organs are not present in abdominal skin

The transplantation of digits from the opposite hand has been reported frequently in the European literature Nicoladoni reported the replacement of a portion of a defective thumb by transplanting the second toe [2] Parin made an extensive study of digital transplantation and reported many cases of his own

As a rule, the ring finger is the one selected for transplant to the opposite hand We have had no experience with the above procedure, but reports available at present would indicate that it is not too desirable The cases reported indicate a general atrophy of the transplanted digit, as well as lack of sensation and function in the joints Better function is reported in toe transplants than in those of the finger

Probably the most desirable reconstructed thumb is that of a pollicization of the index finger I doubt very much the advisability of sacrificing a normal index finger to reconstruct a thumb, but in most cases where the thumb is lost as a result of injury, there will be some damage to the index finger as well As a rule, it is non functioning as to position, and transplanting it to the thumb also relieves the limitation of the remaining finger The advantage of pollicization of the index finger is that the normal sensation, blood supply, and tendon and muscle function can be carried with the bone and skin to the new position A portion of the second metacarpal or the stump of the proximal phalanx is transplanted to the stump of the first metacarpal

It is necessary that the finger be rotated almost 90 degrees so that it will be in the proper position for opposition against the fingers The nerves of the index finger are well divided into the base of the hand and allowed to assume a new position in the hypothenar eminence It is more desirable to maintain the flexor tendon of the index finger than to attach the flexors of the thumb to the transplanted finger The long extensors of the index finger are also transplanted, well to the radial side of the wrist, so that the pull will be in the desired direction to allow abduction and opposition In many cases there will be a loss of the opponens muscles of the hypothenar eminence, and an opponens operation will be necessary to restore this function

An essential problem that is very often overlooked or inadequately appreciated is the relative length of the index finger as compared with a normal thumb Also ignored is the fact that a thumb is a two-joint digit and that three joints in the transplant are not only unnecessary but are not desirable As a rule, the distal phalanx may be sacrificed so that the finger can be shortened to the more nearly normal length of the thumb Another definite advantage in sacrificing the distal phalanx is that there is a change in the direction and an increase in the width of the distal sensory pulp so that it more nearly compares with the distal phalanx of the thumb which normally goes into hyperextension and thus increases the surface which contacts the other fingers An index finger cannot adequately be freed without the use of a flap, usually abdominal, to form a web between the new-formed thumb and the fingers

The execution of rough and gross procedures is the first step in rehabilitation Later the gradual transition to the finer and more meticulous types of occupational therapy should be accomplished

Summary

Various methods and problems in reconstruction of a thumb are considered The three important factors are maintaining sensation, maintaining the ability to oppose the thumb against the fingers, and having the position of opposition away from the palm when possible

A satisfactory substitute for a missing thumb can usually be produced by one of the above-mentioned procedures

THE PHYSICIAN AND THE DETECTION OF PRESYMPTOMATIC CANCER

Siegfried W Westing, M.D , Brooklyn, New York

(From the Brooklyn Cancer Institute and the Kings County Hospital)

THANKS to the educational activities of the American Cancer Society the public is gradually becoming aware of the fact that cancer has a much better prognosis if discovered before subjective symptoms appear Consequently, with increasing frequency persons who consider themselves healthy apply to the physician for cancer detection. Compelled to take a stand in this matter the physician finds himself confronted with a number of questions Which persons and which organs should be examined? How should the examination be conducted? Which laboratory tests and which specialized studies are essential? At what intervals should the examination be repeated? Who is qualified to perform the examination? If, in search for answers to these questions, the physician consults the current medical literature, he will discover that many of the details of the problems are still in a controversial state For instance, whereas the editors of the *Journal of the Medical Society of New Jersey* feel that cancer detection examination of apparently healthy people belongs to the general practitioner, a writer from New York maintains that cancer detection in symptom-free persons is no longer a one man job [1 2] Time will ultimately produce a definite solution of the problems Meanwhile, the author submits his answers to the profession for consideration

Persons of any age may harbor malignancy Science does not possess a generally accepted, single test to indicate whether malignancy exists in an individual These two facts would seem to render it imperative to examine periodically every organ of every person from birth on for signs of beginning malignancy While such a program would represent the ideal, it cannot be carried out with the physicians' time available Even if the search is confined to the less deep-seated organs, to examine the entire population of the United States once a year would add to every physician's daily activities an average of five hours of strenuous work Examinations which include every organ or nearly every organ are applicable to a selected few but are out of the question as a large-scale program For any project that intends to be or, at least, to approach a mass survey, it becomes necessary to limit the search to the age groups with a comparatively high incidence of malignancy and to those organs where malignancy is frequent, easily discoverable, and comparatively easily cured

Cancer as the cause of death plays an important role in persons over forty years only The initial stages of these cancers must be detectable at some time prior to death Therefore, it seems warranted to stipulate that candidates for the cancer detection examinations be thirty-five years and over While persons under thirty-five years will not be refused (at one of the detection clinics children from one year on are accepted), large-scale surveys of persons younger than this must be dispensed with as long as physicians' time is a factor

Those of us who have been engaged in cancer detection work find it expedient to combine the search for cancer with a general health check-up, taking into consideration chiefly such important noncancerous conditions as tuberculosis, syphilis, renal-cardiovascular disease, and diabetes The cancer-detection examination thus becomes a periodic health examination characterized by the emphasis placed on the search for those malignancies which are frequent, easily detectable, and comparatively easily cured

The examination begins with the taking of the past and family history Although the examinee considers himself symptom-free, thorough questioning may elicit relevant facts such as change in bowel movements, loss of weight, or loss of appetite The person's habits (eating, sleeping, intake of stimulants and poisons, including occupational poisons) are discussed The weight of the examinee is recorded, so that a change can be discovered during subsequent examinations Inspection and palpation of skin, lips, mouth, tongue, pharynx, axillae, supraclavicular regions, neck (thyroid), and inguinal regions is done Blood pressure is measured, reflexes are tested, and percussion and auscultation of the chest are performed The rectum is examined digitally, while the patient is standing or squatting, as a much longer stretch of bowel can be investigated in upright position During this examination in a man, attention is paid to the condition of the prostate The examinee is then placed on the examining table for the inspection and palpation of the breasts and the abdomen (liver, spleen, kidneys) Finally, in women, the pelvic organs are examined in the customary position

A vaginal smear may be obtained and processed according to Papanicolaou [3] One will keep in mind that a negative Papanicolaou smear does not rule out genital cancer and that about 20 per cent of the positives are false positives [4] These false positives may create distress for the examinee and embarrassment for the physician In spite of these shortcomings the test promises to be accepted as a useful screening method Other essential laboratory tests are urinalysis, differential blood count, hemoglobin determination, and a serum reaction for syphilis Examination of the feces for occult blood may yield valuable information It has been pointed out, and my experience confirms it, that the preparatory abstention from meat can often be dispensed with since most people have a negative benzidine test even when they are unprepared [5] A positive result obtained under these circumstances will, of course, have to be verified by repetition after the conventional preparation

Up to this point the examination can be performed readily by any well-trained physician. The question arises as to which specialized studies are indicated The organs covered thus far furnish approximately 40 per cent of all the fatal cancers. The application of the laryngoscope raises this percentage to 42 Fluoroscopic or roentgenographic chest study takes care of organs which are the site of 10 per cent of the fatal cancers, quite an impressive figure However, in view of the fact that with today's therapeutic armamentarium the cure rate of pulmonary cancer is still low, the roentgen study of the symptomless chest cannot be expected to reduce the cancer death rate materially Yet it will be retained as a tuberculosis case-finding method Proctosigmoidoscopy is of great value in any cancer detection project One cancer detection clinic reports that five cancers and 18 polyps were found proctosigmoidoscopically among 299 cases without symptoms [4] The scope not only visualizes the lesions disclosed by the digital examination of the rectum but also extends the survey into a new area which contributes 4 per cent to the number of killing cancers If a Papanicolaou smear is taken, none but an experienced pathologist can attempt to interpret it

Malignancies of the stomach and of the colon beyond the reach of the proctosigmoidoscope are decidedly frequent, either of these two groups takes up about 14 per cent of the fatal cancers. If the recommended schedule of examination is carried out, the only hints that early malignancy may be present in these organs are the findings of occult blood in the feces, loss of weight, or anemia Some authors advocate a much more active attitude in the search for presymptomatic gastric cancer Surgeons, alarmed by the low cure rate of advanced gastric cancer—and most of the gastric cancers are advanced by the time they reach the surgeon—have advised that periodically the stomachs of symptom-free persons of cancer age undergo various examinations, chiefly roentgen studies [6 7] Others wish to see this procedure confined to men, since gastric cancer is more prevalent among men than among women While it is usually easy for an expert to recognize an advanced gastric cancer with the help of x-ray methods, the problem of discovering an early gastric malignancy roentgenologically is a decidedly difficult one An experienced roentgenologist will have to perform a thorough fluoroscopy, take spot films with and without graded compression under fluoroscopic control, and scrutinize the full series of films taken with varying amounts of opaque material, if he wishes to accomplish the task with as few false positives and false negatives as possible The files of the American Medical Association list 2,589 physi

cians as limiting their practice or giving special attention to roentgenology and radiology If one estimates that there are 5,000 physicians qualified to perform the x-ray examination of the stomach, and if every man of cancer age would undergo such an examination once a year, it would mean that 23 such examinations would have to be added daily to the ordinary duties of the roentgenologist It is obviously impossible to carry out such a project on a scale anywhere near a mass survey Another point to consider is the occupational hazard which accompanies fluoroscopic work. If the roentgenologists were exposed to such an excessive increase of irradiation, the danger to their health would be a factor not to be neglected

Under these circumstances it is understandable that shortened procedures have been looked for St John, Swenson, and Harvey have performed the experiment of fluoroscoping rapidly the stomachs of 2,432 symptom-free men and women over fifty years of age [8] They were aware that their method did not come up to the standards of a full-size roentgen survey of the stomach, and there is no way of knowing how many cancer cases may have escaped detection However, even their rapid method discovered three cases of malignancy, unsuspected before the examination, later corroborated by more extensive studies and finally proved by surgery Two of these three cases of unsuspected gastric malignancy are now without evidence of disease over five years after the resection [9] In addition to these three cases, there were five other cases where fluoroscopy aroused suspicion of malignancy More careful investigation seemed to bear out the first impression, and resection disclosed benign ulcers

Dailey and Miller examined fluoroscopically 500 men over forty-five years of age with no digestive complaints [10] They had to call back 29 of these men for more thorough study One was diagnosed as gastric ulcer, one as suspicion of antral polyp, and one as marked antral deformity Only the latter consented to further study, and, after the diagnosis had been verified by gastroscopy, received a subtotal gastrectomy Nothing worse than a gastritis was found

One cannot remain unconcerned about the fact that six persons had a partial stomach resection for a symptomless ulcer or gastritis and that one of these operations caused a fatality (One patient of the first series died on the fifth postoperative day of pulmonary embolism.) The literature reports many cases—and every experienced roentgenologist can easily increase the list—where an unnecessary operation was performed on the strength of misinterpreted x-ray findings One has to keep in mind the shortcomings of our diagnostic and surgical procedures when he attempts to decide whether rapid fluoroscopy or other short-cut x-ray examinations, or any x-ray procedures at all, are advisable as means of detecting gastric cancer in symptom-free persons Realizing that false positives are not at all rare and that the operative mortality, even in good clinics, is far from zero, I wish to side with those authors who feel that x-ray examinations of the stomach have no place in the schedule to be applied to the detection of malignancy in symptom-free persons on a mass survey scale [10–12]

Nobody, to my knowledge, has proposed routine periodic colon x-ray studies in symptom-free persons Such an undertaking would be impractical for the same reasons that were stated in regard to the stomach While the importance of digital and proctosigmoidoscope examinations was emphasized before, x-ray study of the symptom-free colon must be reserved for exceptional cases

It will be noted that the organs dealt with so far contribute 84 per cent of the fatal cancers The remaining 16 per cent originates in organs, such as the central nervous system, esophagus, small intestine, liver, pancreas, urinary tracts, adrenals, and bones, which are either rarely affected by cancer or less readily accessible to diagnostic and therapeutic procedures and, therefore, find but little space in the program of presymptomatic cancer detection

Who should perform the examination of symptom-free persons? Cancer detection clinics as they are now being organized in increasing numbers are staffed and equipped to do all that is necessary in this respect A report from one of these clinics reveals that six specialists and six nonmedical personnel are spending four hours each week to examine 16 people [2] Those persons over forty years of age are invited for a return visit in six months, a policy essential for the effectiveness of the project If they do return every half year, they will absorb all or nearly all the time of the clinic, and new applicants will have little chance to be admitted, once the service has been in operation for a half year That means the clinic will watch over the health of about 400 people This figure represents about 1/1,300 of the cancer age population of that community To provide the entire community with a similar service, 1,299 more such clinics would be required Other cancer detection clinics work with more speed, but on the whole the tendency in these clinics is to examine each person as thoroughly as possible—even ophthalmoscopy is included, as a rule, despite the known

Those of us who have been engaged in cancer detection work find it expedient to combine the search for cancer with a general health check-up, taking into consideration chiefly such important noncancerous conditions as tuberculosis, syphilis, renal-cardiovascular disease, and diabetes The cancer-detection examination thus becomes a periodic health examination characterized by the emphasis placed on the search for those malignancies which are frequent, easily detectable, and comparatively easily cured

The examination begins with the taking of the past and family history Although the examinee considers himself symptom-free, thorough questioning may elicit relevant facts such as change in bowel movements, loss of weight, or loss of appetite The person's habits (eating, sleeping, intake of stimulants and poisons, including occupational poisons) are discussed The weight of the examinee is recorded, so that a change can be discovered during subsequent examinations Inspection and palpation of skin, lips, mouth, tongue, pharynx, axillae, supraclavicular regions, neck (thyroid), and inguinal regions is done Blood pressure is measured, reflexes are tested, and percussion and auscultation of the chest are performed The rectum is examined digitally, while the patient is standing or squatting, as a much longer stretch of bowel can be investigated in upright position During this examination in a man, attention is paid to the condition of the prostate The examinee is then placed on the examining table for the inspection and palpation of the breasts and the abdomen (liver, spleen, kidneys) Finally, in women, the pelvic organs are examined in the customary position

A vaginal smear may be obtained and processed according to Papanicolaou [3] One will keep in mind that a negative Papanicolaou smear does not rule out genital cancer and that about 20 per cent of the positives are false positives [4] These false positives may create distress for the examinee and embarrassment for the physician In spite of these shortcomings the test promises to be accepted as a useful screening method Other essential laboratory tests are urinalysis, differential blood count, hemoglobin determination, and a serum reaction for syphilis Examination of the feces for occult blood may yield valuable information It has been pointed out, and my experience confirms it, that the preparatory abstention from meat can often be dispensed with since most people have a negative benzidine test even when they are unprepared [5] A positive result obtained under these circumstances will, of course, have to be verified by repetition after the conventional preparation

Up to this point the examination can be performed readily by any well trained physician The question arises as to which specialized studies are indicated The organs covered thus far furnish approximately 40 per cent of all the fatal cancers The application of the laryngoscope raises this percentage to 42 Fluoroscopic or roentgenographic chest study takes care of organs which are the site of 10 per cent of the fatal cancers, quite an impressive figure However, in view of the fact that with today's therapeutic armamentarium the cure rate of pulmonary cancer is still low, the roentgen study of the symptomless chest cannot be expected to reduce the cancer death rate materially Yet it will be retained as a tuberculosis case-finding method Proctosigmoidoscopy is of great value in any cancer detection project One cancer detection clinic reports that five cancers and 18 polyps were found proctosigmoidoscopically among 299 cases without symptoms [4] The scope not only visualizes the lesions disclosed by the digital examination of the rectum but also extends the survey into a new area which contributes 4 per cent to the number of killing cancers If a Papanicolaou smear is taken, none but an experienced pathologist can attempt to interpret it

Malignancies of the stomach and of the colon beyond the reach of the proctosigmoidoscope are decidedly frequent, either of these two groups takes up about 14 per cent of the fatal cancers If the recommended schedule of examination is carried out, the only hints that early malignancy may be present in these organs are the findings of occult blood in the feces, loss of weight, or anemia Some authors advocate a much more active attitude in the search for presymptomatic gastric cancer Surgeons, alarmed by the low cure rate of advanced gastric cancer—and most of the gastric cancers are advanced by the time they reach the surgeon—have advised that periodically the stomachs of symptom-free persons of cancer age undergo various examinations, chiefly roentgen studies [6 7] Others wish to see this procedure confined to men, since gastric cancer is more prevalent among men than among women While it is usually easy for an expert to recognize an advanced gastric cancer with the help of x-ray methods, the problem of discovering an early gastric malignancy roentgenologically is a decidedly difficult one An experienced roentgenologist will have to perform a thorough fluoroscopy, take spot films with and without graded compression under fluoroscopic control, and scrutinize the full series of films taken with varying amounts of opaque material, if he wishes to accomplish the task with as few false positives and false negatives as possible The files of the American Medical Association list 2,589 physi

cians as limiting their practice or giving special attention to roentgenology and radiology If one estimates that there are 5,000 physicians qualified to perform the x-ray examination of the stomach, and if every man of cancer age would undergo such an examination once a year, it would mean that 23 such examinations would have to be added daily to the ordinary duties of the roentgenologist It is obviously impossible to carry out such a project on a scale anywhere near a mass survey Another point to consider is the occupational hazard which accompanies fluoroscopic work. If the roentgenologists were exposed to such an excessive increase of irradiation, the danger to their health would be a factor not to be neglected

Under these circumstances it is understandable that shortened procedures have been looked for St John, Swenson, and Harvey have performed the experiment of fluoroscoping rapidly the stomachs of 2,432 symptom-free men and women over fifty years of age [8] They were aware that their method did not come up to the standards of a full-size roentgen survey of the stomach, and there is no way of knowing how many cancer cases may have escaped detection However, even their rapid method discovered three cases of malignancy, unsuspected before the examination, later corroborated by more extensive studies and finally proved by surgery Two of these three cases of unsuspected gastric malignancy are now without evidence of disease over five years after the resection [9] In addition to these three cases, there were five other cases where fluoroscopy aroused suspicion of malignancy More careful investigation seemed to bear out the first impression, and resection disclosed benign ulcers

Dailey and Miller examined fluoroscopically 500 men over forty-five years of age with no digestive complaints [10] They had to call back 29 of these men for more thorough study One was diagnosed as gastric ulcer, one as suspicion of antral polyp, and one as marked antral deformity Only the latter consented to further study, and, after the diagnosis had been verified by gastroscopy, received a subtotal gastrectomy Nothing worse than a gastritis was found

One cannot remain unconcerned about the fact that six persons had a partial stomach resection for a symptomless ulcer or gastritis and that one of these operations caused a fatality (One patient of the first series died on the fifth postoperative day of pulmonary embolism) The literature reports many cases—and every experienced roentgenologist can easily increase the list—where an unnecessary operation was performed on the strength of misinterpreted x-ray findings One has to keep in mind the shortcomings of our diagnostic and surgical procedures when he attempts to decide whether rapid fluoroscopy or other short-cut x-ray examinations, or any x-ray procedures at all, are advisable as means of detecting gastric cancer in symptom-free persons Realizing that false positives are not at all rare and that the operative mortality, even in good clinics, is far from zero, I wish to side with those authors who feel that x-ray examinations of the stomach have no place in the schedule to be applied to the detection of malignancy in symptom-free persons on a mass survey scale [10–12]

Nobody, to my knowledge, has proposed routine periodic colon x-ray studies in symptom-free persons Such an undertaking would be impractical for the same reasons that were stated in regard to the stomach While the importance of digital and proctosigmoidoscope examinations was emphasized before, x-ray study of the symptom-free colon must be reserved for exceptional cases

It will be noted that the organs dealt with so far contribute 84 per cent of the fatal cancers The remaining 16 per cent originates in organs, such as the central nervous system, esophagus, small intestine, liver, pancreas, urinary tracts, adrenals, and bones, which are either rarely affected by cancer or less readily accessible to diagnostic and therapeutic procedures and, therefore, find but little space in the program of presymptomatic cancer detection

Who should perform the examination of symptom-free persons? Cancer detection clinics as they are now being organized in increasing numbers are staffed and equipped to do all that is necessary in this respect A report from one of these clinics reveals that six specialists and six nonmedical personnel are spending four hours each week to examine 16 people [2] Those persons over forty years of age are invited for a return visit in six months, a policy essential for the effectiveness of the project If they do return every half year, they will absorb all or nearly all the time of the clinic, and new applicants will have little chance to be admitted, once the service has been in operation for a half year That means the clinic will watch over the health of about 400 people This figure represents about 1/1,300 of the cancer age population of that community To provide the entire community with a similar service, 1,299 more such clinics would be required Other cancer detection clinics work with more speed, but on the whole the tendency in these clinics is to examine each person as thoroughly as possible—even ophthalmoscopy is included, as a rule, despite the known

rarity of ocular malignancy. Therefore, the capacity of these clinics as they are operating at present is quite limited. *New York Medicine*, admitting that "almost any conceivable number of cancer detection clinics will not be able to meet the public demand for this service," raises the question "Should it not be well, therefore, for private physicians to undertake whenever possible a comparable service for their private patients?"[13] A number of physicians have undoubtedly time to spare. Some of these are qualified and equipped to perform the examinations. Others may be able to acquire the training and install the equipment needed for this activity, and still others will have to arrange a collaboration with representatives of the various specialties mentioned above in order to supplement their own examinations.

Concerning the frequency with which the examinations should be repeated, various recommendations have been made ranging from once to four times a year. A larger number of persons can probably be accustomed to submit to such an examination once a year rather than several times a year. Since the annual check-up has a better chance of appealing to the public, it is likely to be more effectual in the long run. For a few individuals (for instance cancerophobics and persons with an incriminating family history) a semiannual health check may be indicated. Should symptoms make their appearance before the year or half year is up, the return visit has to take place immediately.

Once a physician has entered this new field of activity, he cannot escape the conclusion that what is valuable for persons who request this service ought to be extended to the entire group of people who depend on him for medical care and who implicitly expect and have a right to expect that he will let them share in the benefits of the advances of medicine. A physician who serves a community of a 1,000 people will see an average of 14 succumb to cancer in the course of ten years. While many of these deaths cannot be prevented with the diagnostic and therapeutic methods at our disposal, a considerable percentage of them could either be avoided or at least postponed if a systematic effort were made. If lack of time, training, equipment on the part of the physician, and lack of cooperation by his community would keep the physician from proceeding with the full cancer detection schedule, he might consider carrying out a partial program. Such a partial program would be based chiefly on the facts that cancers of the female breast and of the uterus constitute about 25 per cent of all fatal cancers (male and female), are comparatively readily discovered and, when found while in an early stage, have a comparatively good prognosis. In this community of 1,000 there are at any time 200 women of cancer age. If these 200 could be induced to submit to a modified cancer detection examination twice or at least once a year, the physician's task would be either 400 or 200 breast plus pelvic examinations annually, a job which may prove to be within the limits of his time, capabilities, and facilities. In this way, he may expect to save two or three of the 14 doomed. If, in addition, he did oral and rectal examinations in men and women, he would be carrying out a program which, although far from covering the entire field of cancer detection, would have the advantages of being applicable to the masses, without burdening the medical profession unduly, and of promising beneficial results of sufficient magnitude.

Summary

Stimulated by the campaigns of the American Cancer Society, the demand for cancer detection examinations of symptom-free persons is steadily increasing. This movement gives rise to a number of questions. Who and what should be examined? How should the examination be carried out, and which laboratory tests and specialized studies are to be performed? How often should a person report for such an examination? Have private physicians, individually or in groups, the time, the qualifications, and the equipment necessary to perform these examinations, or does this work belong to the cancer detection clinics exclusively? Answers to these questions are submitted to the profession for consideration. The author hopes to bring this controversial matter a little nearer to a practical and generally acceptable solution and to assist the private physician in establishing his place in this field of activity so widely publicized of late.

RELIEF OF PERIPHERAL VASCULAR PAIN AND ANGIOSPASM BY INTERLAMINAR RHIZOTOMY

JOSEPH H SIRIS, M D , and JACOB W KAHN, M D , Brooklyn, New York

(From the Department of Neurological Surgery and the Peripheral Vascular Division of the Department of Medicine, Jewish Hospital of Brooklyn)

A VARIETY of neurosurgical procedures is available for the relief of the pain of peripheral vascular disease Unfortunately, most of these are either not consistently successful or are of such magnitude as to be undertaken only in cases where the pain factor is extreme In patients in whom vasospasm is an important factor in the production of pain or paresthesia, as in those suffering from Raynaud's disease or causalgia, interruption of the sympathetic pathways, chemically or surgically, is warranted However, because of the marked capacity for regeneration in sympathetic nerves, the long-term follow-up results are not uniformly good

More recently, similar treatment has been recommended for the pain of Buerger's disease in patients in whom angiospastic factors can be demonstrated by reliable vasomotor tests, such as sympathetic nerve block or spinal anesthesia While it is true that pain relief may be expected to some degree in such instances, there are occasional patients who, although free of the generalized, radiating ischemic pain, still continue to suffer severe local pain at the site of a gangrenous process Furthermore, since such interruption of the sympathetic pathway does not cure or prevent the further ravages of this recurrent disease, and since regeneration of sympathetic nerves may be expected over a period of time, the procedure cannot be said to be wholly satisfactory

It has been suggested that relief of peripheral vascular pain in the foot may be achieved by cutting the sensory fibers to that area. In our experience, despite complete interruption of all the known sensory nerves of the foot, intractable pain persisted This suggested to us that the pain of peripheral vascular disease may be carried by autonomic rather than somatic pain fibers

Complete relief of peripheral vascular pain, in the foot, at least, can be achieved by spinothalamic tractotomy, but this is a procedure to be undertaken only if the pain is severe enough to require amputation as the only other alternative procedure There appears to be some evidence that this form of cordotomy may be followed by some improvement in skin temperature, either as a result of abolishing a vasoconstrictor reflex evoked by pain or possibly by coincident interruption of descending vasoconstrictor impulses in the cord

In considering further the problem of relieving intractable peripheral vascular pain, we have been impressed with the possibility of interrupting pain impulses from the foot by the relatively simple procedure of extrathecal section of the sensory fibers of the lower lumbar and first sacral nerves through an interlaminar approach The selection of particular roots to be sectioned depends on the distribution of the patient's pain This operation as a possibility for relief of foot pain secondary to peripheral vascular disease suggested itself through experience with the surgery of ruptured low lumbar intervertebral disks, where it was found that the fourth and fifth lumbar and first sacral nerves, the essential sensory innervation of the foot, could be exposed without laminectomy, or minimal laminar edge trimming As yet, it is too early to assess the merits of this procedure, the use of which is postulated not only on the possibility of relieving pain but also on the possibility of abolishing the vasospastic reflex evoked by pain If subsequent experience with the operation confirms the favorable results obtained in the cases under review here, it may prove to have a place in our armamentarium for the relief of peripheral vascular pain

Dermatomic studies that have resulted from experience with radiculitis secondary to herniated lumbar disk permit fairly accurate determination of the roots requiring section for a given patient's pain [1] Thus, pain confined to the great toe was considered as perhaps relievable by section of the posterior roots of the fourth and fifth lumbar nerves Pain involving the more lateral toes and lateral aspect of the foot was considered as possibly requiring section of the posterior root of the first sacral nerve.

To test this hypothesis, the following two advanced cases of peripheral vascular disease were selected for this type of pain-relieving procedure The criteria underlying their selection were failure to secure relief with more conservative measures and the likely prospect of amputation as the only alternative that could be offered

Case Reports

Case 1 —J K., a sixty-year-old white man, a

known sufferer from peripheral vascular disease of the lower extremities for two years, was admitted to the hospital complaining of severe pain of three months duration in the toes of the right foot The pain was described as burning, originally precipitated by walking but subsequently present at rest and becoming more severe on activity It was at times so intense that the patient was unable to sleep

The past history disclosed that the patient had been a known diabetic for seventeen years and was controlled by diet alone during the past few years He had been attending the peripheral vascular clinic for treatment for two years prior to admission In 1931 and again in 1934, the patient had suffered episodes of coronary thrombosis and at the time of admission was the victim of anginal syndrome on exertion, relieved by nitroglycerine

Examination disclosed the following significant findings Blowing systolic murmur in the mitral area, nontender liver edge 5 cm below the costal margin, and bilateral inguinal hernia The extremities exhibited cyanotic rubor of the right foot, most marked in the toes Infection in the nerve bed of the right first toe was present The right foot was colder than the left Dorsalis pedis and posterior tibial arterial pulses were not palpable on either side Oscillometric studies and skin surface temperature determinations were markedly diminished below the normal levels in both lower extremities A spinal anesthesia vasomotor test performed on March 26, 1947, showed evidence of marked organic vascular occlusive disease involving both lower extremities, more pronounced on the right side There was no response in temperature elevation on the right side and a moderate response on the left

Fasting blood sugar studies showed a level of 116 mg per cent Urea nitrogen was 16 6 mg per cent

On April 2, 1947 a right lumbar sympathectomy with excision of the second and third lumbar ganglia was carried out This procedure relieved the radiating pain in the limb, but severe pain still persisted in the right first toe about the site of a gangrenous process in the ungual region The patient was discharged to the follow-up clinic, but because of persistence of pain in the right first toe, he was re-admitted to the hospital where a posterior rhizotomy of the right fourth and fifth lumbar roots was carried out on May 27, 1947 Following operation, the pain was of appreciably decreased severity but was present at irregular intervals throughout the day

When re-evaluated in the follow-up clinic on June 17, 1947, twenty-one days after operation, the patient was found to be free of the major portion of the pain, which prompted the operative procedure He suffered only moderate discomfort in the offending toe and, for the first time, was occasionally free of all pain On examination both feet were found to be ruborous at the distal plantar portions and toes on dependency No pallor was present on elevation of either foot The necrotic ulcer of the nail bed of the right first toe showed evidence of localization and demarcation and was dry

Skin surface temperature studies prior to operation had shown the toes of the right foot to be 1 to 1 5 degrees (F) warmer than the corresponding areas on the left toes Twenty-one days after rhizotomy similar readings showed the right toes to be 3 to 4 degrees warmer than the left The oscillometric studies were unaltered

When seen on July 18, 1947, the patient noted that improvement was continuing and that the former pain in the remaining toes and dorsum of the foot had cleared up completely He stated that he slept six hours a night instead of the former (preoperative) two Apart from a very slight weakness of dorsiflexion of the right foot, no demonstrable limitation of motor power was observed Sensory examination disclosed a hypalgesia of the first four toes of the right foot An interesting feature was the fact that, although vibratory sensibility was disturbed in these toes, muscle-joint sense appeared to be intact

On August 1, 1947, two months after operation, healing of the great toe was noted The patient stated that his pain was 75 per cent improved and expressed himself as being satisfied with the operation

Case 2—F S, a forty-six-year-old Negro man, was admitted to the hospital on March 21, 1947, complaining of pain and swelling of the toes of the right foot of four months duration This started with pain and ulceration of the fifth toe followed after about two months by similar involvement of the first toe The ulceration in the former digit healed, that in the latter persisted, presumably because of an underlying osteomyelitis, which was revealed by x-ray study For about two months prior to admission the patient had been subject to intermittent claudication in the right calf muscles on walking half a block At the time of admission he complained of extreme pain in the first and fifth toes of the right foot

Of interest was the fact that six years previously the patient first noted swelling and pain in the first toe of the left foot which subsided after several months

Examination after admission disclosed the following significant findings

Right foot—Deeply ruborous on dependency There was no pallor on elevation of the extremity The foot was slightly warm Pulsation was present in the femoral artery but not in the dorsalis pedis or posterior tibial vessels There was marked edema of the right foot, ankle, and lower leg A dry gangrenous plaque was present on the plantar surface of the distal portion of the first right toe, and an infected gangrenous fissure was present at the base of the right fifth toe

Left foot—Pulsation was present in the femoral artery but absent in the dorsalis pedis and posterior tibial vessels Slight edema was present in the left foot which was "icy" cold to touch

Oscillometry showed asymmetry between the two limbs, the left leg being affected more than the right Skin surface temperatures were slightly diminished in the toes on the right side and markedly diminished in the left toes

Paravertebral sympathetic block at the first to fourth lumbar vertebrae was carried out on three occasions with immediate temporary relief following each procedure Despite this it was felt that in view of the likely progressive nature of the disease more than sympathetic interruption would be required to effect permanent relief of the patient's pain

Accordingly, on May 1, 1947, the posterior roots of the fifth lumbar and the first sacral nerves on the right side were sectioned under spinal anesthesia This resulted in marked relief of the pain in the patient's toes, associated with hypesthesia corresponding to the dermatomes of the sectioned roots There was no evidence of foot drop or other motor weakness

When seen on May 20, 1947, it was noted that the patient could walk about without pain and that, while at the previous study he could not keep the limb elevated for more than two minutes without severe anoxic pain, he was able to keep the foot elevated for fully ten minutes without symptoms at this examination On dependency, the right foot was found to be ruborous but not cadaveric on elevation, while the left foot was typically cadaveric on elevation and slightly ruborous on dependency Oscillometry was found to be diminished as compared with the study made twenty-two days previously, which was possibly due to the progress of the disease also seen on the left side The skin temperatures in the right toes were somewhat higher than on the left, while the plantar foot and ankle temperatures on the right were considerably higher than those at corresponding levels on the left side

He was re-admitted on July 15, however, because of a cerebrospinal fluid cyst at the wound site and pain along the medial aspect of the right great toe, corresponding to the fourth lumbar dermatome (the root which had not been sectioned) The cyst was tapped on three occasions, and a tight pressure dressing was applied. This resulted in its disappearance and abatement of the pain Skin surface temperature studies on July 30, 1947, showed a rise of 3 degrees in the corresponding areas of the toes as compared with the preoperative studies

When seen in the follow-up clinic on August 18, 1947, three months following operation, the patient stated that he was practically completely free of pain except for a slight degree at night However, he and wife noted that, whereas formerly he could get no more than two hours of sleep a night because of the pain, he now slept the night through He was able to resume his work as a car washer in a garage without pain or discomfort in the foot. The wound on the plantar aspect of the right first toe, which was somewhat slow in healing, however, gradually began to granulate and gave the patient no subjective symptoms He was able to do his usual work with a small dressing on the toe

Comment

Reported herein are two cases of intractable peripheral vascular pain treated by interlaminar rhizotomy The background underlying the evolution of this procedure is discussed

It was felt that the procedure possibly spared each of these patients an amputation

The resultant subjective and objective hypalgesia corresponded to the areas subserved by the sectioned roots

Misgivings as to the possibility of having a useless as well as painless foot as a result of damage to fibers carrying impulses of position sense were not borne out by the results obtained Interestingly enough, although hypalgesia was appreciable, the impairment of position sense was minimal and certainly not enough to impair the usefulness of the foot The explanation of this phenomenon is difficult to find, but it may be postulated that the severance of two adjacent posterior roots, while sufficient to abolish pain in the dermatomes subserved by them, is not sufficient to give a comparable loss of position sense, because of "sensory overlapping" from adjacent dermatomes

Significant motor weakness did not result from the operative procedure in either of these cases and undoubtedly should not if the section is confined to the posterior roots

It is our belief that there has been definite improvement in collateral circulation because of the findings of no improvement in the oscillometric studies—in fact, a diminution in oscillometry in one case—accompanied by definite increase in skin surface temperature readings following the procedure in both cases That this may not be due to a remission, such as occurs with Buerger's disease, is indicated by the fact that the associated osteomyelitic process in the second case remained active in the face of absence of pain and increased circulation to the part Such infection usually precipitates severe pain and angiospasm The osteomyelitis subsequently responded more rapidly with the improved circulatory status

Therefore, it appears that relief of angiospasm in these cases, apart from the associated relief of pain, is attributable to abolition of the vasospastic reflex evoked by the pain factor

NEW WAYS OF INFLUENCING THE INTRAOCULAR PRESSURE

FREDERICK W STOCKER, M D , Durham, North Carolina

(From the McPherson Hospital and the Glaucoma Clinic of Duke University School of Medicine)

EVER since it was recognized that the main feature of glaucoma in general was an increase in intraocular tension, efforts were directed toward reducing this tension Mainly, two ways were followed to accomplish this Due to the fact that drugs which create miosis proved to reduce the intraocular tension, pilocarpine and eserine were used for many years, but, as our knowledge of the mechanism of sympathetic and parasympathetic stimulation increased, numerous compounds were discovered that would have a similar effect, the newest of them being Furmethide (furfuryl-trimethyl-ammonium iodide) and D F P (di-isopropyl fluorophosphate) These compounds are usually either cholin-like substances or cholinesterase inhibitors On the other hand, surgery attained a pre-eminent position for all cases where the intraocular tension could not be normalized by these drugs The principle of almost all the operations for glaucoma was to establish some sort of a safety valve through which the intraocular fluid could escape, which would naturally reduce the intraocular tension Both miotics and filtering operations have their great merits They have saved many eyes from blindness and will always play an important role in the treatment of glaucoma It seems to me, however, that research toward finding new miotics and inventing new filtrating operations has led us, so to speak, into a blind alley Some of the newer miotics are more powerful than pilocarpine and eserine and are able to control some cases that would not be normalized by these drugs, but it was found that some of them may, in some instances, produce side-effects that are undesirable and even harmful This applies to histamine and D F P in particular

As to surgery, it seems to me that this must appear to us as a rather crude treatment The research done during the last few decades has proved that the regulation of the intraocular tension is an extremely complicated and subtle mechanism Most glaucoma operations are crippling injuries to the eye They reduce the tension drastically and may lead to a shallow chamber of long or even permanent duration which causes displacement of the lens and cataract Cyclodiathermy puncture is not exempt from this criticism, as coagulating the ciliary body is a severe injury to the eye These operations certainly cannot be the ultimate answer to the problem Glaucoma research should, therefore, reach out into other directions and tackle the problem from other angles than miotics and filtering operations.

Three years ago, in a paper read in this city, I introduced cyclodiathermy puncture for the first time as an operation for chronic simple glaucoma. Up to then, this procedure had been reserved almost exclusively for desperate cases that had resisted all other treatments Since then, the resident staff of Duke University Hospital and I in my private patients at McPherson Hospital have used this method extensively in almost every kind of glaucoma Although we do not have enough cases in all categories to provide a statistical basis, some general ideas about the indications of the cyclodiathermy puncture are reflected in Tables 1 and 2 In order to keep any personal factor from influencing the statistics I present the results of cases that have not been operated on by me As to the first table, I should say that more cases have been performed, but due to the fact that a great number of our clinic patients live so far away, many of them would not return for observation after an apparently successful operation It is our impression that cyclodiathermy puncture is at least as good as any other operation in the chronic simple glaucoma of

TABLE 1 —RESULTS OF CYCLODIATHERMY PUNCTURE* IN 32 CASES OF CHRONIC SIMPLE GLAUCOMA IN NEGROES

Tension	Number of Cases	Average Period of Observation (Months after C.D P)	Longest Period of Observation (Months after C.D P.)
Normalized	20	11 5	31
Improved but not normalized	7	12 8	32
Not improved	5	14 8	21
Total	32		

* Operations performed by the resident staff of Duke University Hospital

TABLE 2 —INDICATION FOR CYCLODIATHERMY PUNCTURE

A. As first operation
   1 Chronic simple and chronic congestive glaucoma in the Negro To be repeated if necessary
   2 Glaucoma of the aphakic eye.
   3 Congenital glaucoma (hydrophthalmus)
   4 Hemorrhagic glaucoma (malignant)
   5 Glaucoma secondary to thrombosis of central retinal vein
   6 Glaucoma combined with rubeosis iridis in diabetes.

B As second operation
   1 Chronic simple and chronic congestive glaucoma in the white after failure of filtering operation.
   2 In all conditions mentioned under A.

Presented, by invitation at the 142nd Annual Meeting of the Society of the State of New York New York Academy on Ophthalmology and Otolaryngology May

the Negro In fact we think it is better, less traumatizing, and easier to perform Even Iliff, who presented one of the most optimistic statistics on the result of filtering operations in the Negro, reports only 54 2 per cent of the cases controlled [1] As to the second table, it must be mentioned that I have used cyclodiathermy puncture as a first operation in several cases of chronic simple glaucoma in white patients also The results were similar to those in the Negro, and no untoward side-effects were noted Nevertheless, having had excellent results with the combined iridencleisis-sclerectomy operation in those cases, I did not see sufficient reason to abandon this technic in favor of cyclodiathermy puncture

It is the purpose of this paper to demonstrate methods, other than miotics and operation, of influencing the intraocular tension We do not pretend to have found the ultimate answer to glaucoma but wish to report the results of our investigations with the hope that they may stimulate the imagination and the efforts of others

Before describing the details of our work it may be appropriate to review briefly the factors that might have an influence on the intraocular tension. The maintenance and regulation of the intraocular pressure is based on the balance of inflow and outflow of the intraocular fluid There must be a central regulating mechanism which probably consists of a combined action of the autonomous nervous system and of hormones The ideal treatment would be to influence this regulating mechanism from a central point The complexity of symptoms that result from the use of drugs acting on the sympathetic and the parasympathetic system in general makes it difficult to restrict their effect to the eye as desired

Disregarding purely anatomic shortcomings such as are present, for instance, in congenital glaucoma, the blood-aqueous barrier, which separates the blood plasma from the intraocular fluid, plays a most important role Be it the secreting apparatus of the ciliary body or the capillary walls in general, the fluid has to pass through that barrier from the vascular system into the eye The capillary walls represent a semipermeable membrane Therefore, an equilibrium of osmotic pressure tends to establish itself on either side of the membrane According to Kinsey and Grant, electrolytes, secreted by the ciliary body in excess of their concentration in the blood, will make water pass through the membrane and thereby create intraocular pressure The excess pressure would be disposed of by the outflow through Schlemm's canal Any change in osmotic pressure on either side of the blood-aqueous barrier will necessarily affect the traffic of water from one side to the other and by that change the intraocular pressure (Fig 1) Aside from the strictly osmotic phenomena, there is a traffic of water and other substances through the membrane that is controlled by the hydrostatic pressure and by the state of permeability of the blood-aqueous barrier Therefore, changes in the permeability of the membrane may also indirectly influence the intraocular tension These three factors, the autonomic nervous system, the osmotic pressure, and the permeability of the blood aqueous barrier, were the object of our experimental and clinical investigations

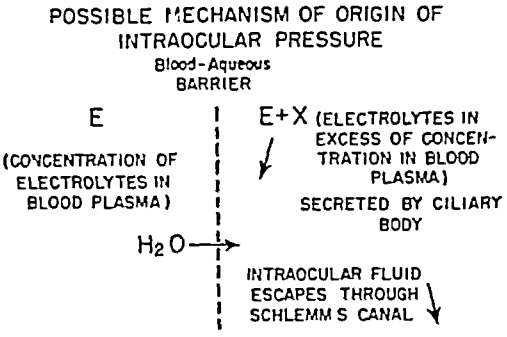

FIG 1 Increased concentration of electrolytes induces water to travel through capillary walls from blood into eye

Considerable work had been done previously by others in order to study the role of the autonomic nervous system in regulating the intraocular tension We will be able to mention only a few attempts briefly Extirpation of the superior cervical sympathetic ganglion has been done in cases of glaucoma The results were inconsistent Sympathetic paralyzers, like ergotamine, were used Results were sporadically encouraging Undesirable side-effects would limit their use. Parasympathetic stimulants, like Pacyl, were used with some effect, but the problem is far from being solved Therefore, we tried to gather some additional information Opportunity for such a study presented itself in two ways First, the surgical treatment of certain cases of arterial hypertension, more widely practiced recently, made it possible to observe the effect of the removal of various parts of the sympathetic nervous system on the eye and on the intraocular tension in particular Second, new drugs acting on the sympathetic and parasympathetic system were made available Our investigation is still in the experimental stage, but some interesting facts have already been gathered

Unilateral or bilateral lumbodorsal sympathectomy would not have any significant effect on either the size of the pupil or the intraocular tension Bilateral, total, transthoracic sympathec-

tomy would result in a moderate lowering of the intraocular tension between 3 to 7 mm Hg observed over a period of three months after the operation Horner's symptom complex would result on one side but not on the other In another case, the same operation would not have any marked influence on the intraocular tension but would result in a low-grade bilateral miosis without enophthalmus We do not know yet what brings about the different reaction to the same type of operation

Tetraethyl-ammonium-chloride (Etamon) is known to have a paralyzing effect on both the sympathetic and parasympathetic nervous systems A nice illustration of this fact could be seen in Dr Hendrix's case, observed at Duke Hospital, of unilateral Horner's symptom complex of unknown origin After intravenous administration of Etamon the small Horner pupil enlarged some and was brought to the same size as the moderately dilated pupil of the normal side as both sphincter and dilator became paralyzed on both sides Etamon also reduces the blood pressure temporarily In a case with occlusion of the central retinal artery we obtained a transitory reduction of the intraocular tension from 19 to 11 and 22 to 13 mm Hg, respectively It is possible that this observation might lead us to a new treatment of acute glaucoma Studies with a somewhat similar substance, Priscol, are also being done, but it is still too early to report any practical results

Attempts to influence the intraocular tension by drastically altering the composition of the blood serum have been successful in cases of acute glaucoma for a long time By injecting hypertonic solutions of salt or glucose intravenously, the osmotic pressure of the blood can be raised Water will flow from the tissue into the blood. The eyeball, by losing part of its water content, may become softer Such drastic measures are obviously not applicable to chronic simple glaucoma Having witnessed the dramatic results of a strict rice diet given by Kempner at Duke Hospital in certain cases of cardiovascular-renal disease, we investigated what influence such a diet would have on the intraocular tension In 12 cases of general hypertension not suffering from glaucoma, the intraocular tension was taken before and after the rice diet was instituted All of them showed a marked reduction of the intraocular tension to a variable degree Reductions from 5 to 7 mm over long periods were not uncommon Most of the cases also reacted with a lowering of the systolic and diastolic blood pressure However, there was no definite parallelism between the drop of tension in the two systems Some cases that responded with a marked lowering of blood pressure had only moderately reduced intraocular pressure, whereas cases with a relatively poor response of the blood pressure would show a considerably lower intraocular pressure Control cases, which had been treated for arterial hypertension but which had not received the rice diet, showed a marked reduction in blood pressure but practically no lowering of the intraocular tension (Figs 2 and 3) *

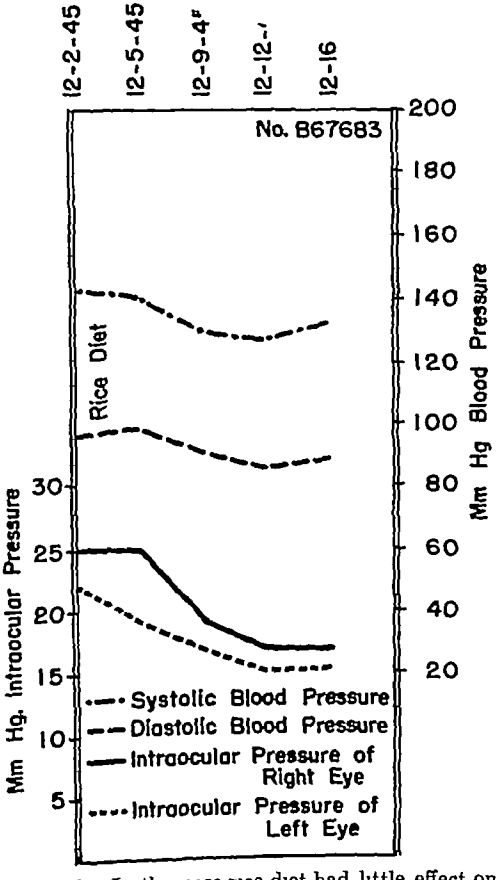

FIG 2 In this case rice diet had little effect on blood pressure but was followed by marked reduction of intraocular tension

The explanation of the phenomenon of the reduction in intraocular tension by the rice diet is still hypothetical For a while we thought that a relative depletion in chlorides of the tissues, brought about by the low chloride rice diet, might have something to do with it, but, recently, we are more inclined to attribute the drop in tension to a possible reduction in the secretion of sodium by the ciliary body This would be in line with the changes taking place in the kidney There

* Complete report to be published in *Archives of Ophthalmology*

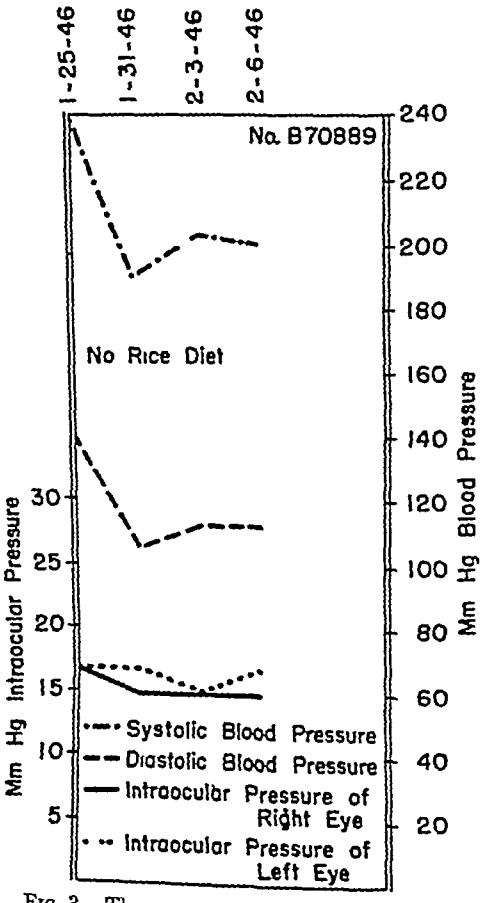

FIG 3 This case was not on rice diet Reduction of blood pressure had no effect on intraocular tension.

we do not have a process of secretion where the sodium is concerned but rather one of reabsorption of sodium in the tubules, which is diminished following the use of the rice diet Whatever the explanation may be, however, the fact exists that the intraocular tension may be influenced by dietary measures under certain circumstances Whether the rice diet will prove to be of value in the treatment of glaucoma is not yet ascertained We are just beginning to try it out in cases of primary glaucoma

The studies of the influence of permeability of the blood-aqueous barrier on the intraocular tension have carried us somewhat farther than the ones on the autonomic nervous system and dietary problems These studies have passed the experimental stage, and a new treatment of glaucoma adjuvant to the treatment with miotics can be devised In order to describe our work in this field, we have to go back to the miotics and their effects on the eye

The current explanation of the reduction of intraocular tension by miotics may be summarized as follows

1 Contraction of the pupil and the ciliary muscle pulling on the scleral spur will widen the chamber angle and facilitate the escape of fluid into Schlemm's canal

2 Dilation of the smaller blood vessels to a various degree promotes absorption of fluid through the choroidal venous plexus, while the arterial supply of the ciliary body is supposed to be reduced by compression of the smaller arteries in that area, due to the contraction of the ciliary muscle

Besides these two main effects, an important side-effect of miotics, the increase in permeability of the blood-aqueous barrier, has been demonstrated by various observers I could confirm these observations using the electrophotofluorometric method [2]

The influence of this side-effect, the increase in permeability of the blood-aqueous barrier on the intraocular tension, has not yet been clearly established Von Sallman and Dillon, explaining the rise of tension following the administration of di-isopropyl fluorophosphate in some of their experimental animals, attribute this rise to the increased permeability of the blood-aqueous barrier [3] From clinical experience I am inclined to believe that increased permeability may be followed by either lowering or raising the intraocular pressure It is not quite clear, though, why in some cases the one occurs and in some the other It seems, however, that the occasional rise of tension, observed clinically after the administration of a miotic, could be explained on this basis The tension-reducing component of contracting the pupil and the ciliary muscle may become partly or totally offset by the side-effect of increasing the permeability of the blood-aqueous barrier In cases where the outflow of fluid is still fairly well maintained, the tension will still be reduced by the miotic In some cases where the outflow is very much reduced, the increase in permeability of the blood-aqueous barrier might lead to a rise of intraocular tension On the other hand, if the increase in permeability could be prevented or reduced, the tension-reducing action of the miotic might be enhanced

This reasoning was the basis of animal experiments and clinical studies It is now well known that certain glucosides belonging to the flavonol group have a definite influence on the permeability and the fragility of the capillaries The first substance of this kind was discovered by Szent-Györgi and his coworkers [4] It was extracted from lemon and called citrin or Vitamin P (P stands for permeability) In our experiments,

tomy would result in a moderate lowering of the intraocular tension between 3 to 7 mm Hg observed over a period of three months after the operation Horner's symptom complex would result on one side but not on the other In another case, the same operation would not have any marked influence on the intraocular tension but would result in a low-grade bilateral miosis without enophthalmus We do not know yet what brings about the different reaction to the same type of operation

Tetraethyl-ammonium-chloride (Etamon) is known to have a paralyzing effect on both the sympathetic and parasympathetic nervous systems A nice illustration of this fact could be seen in Dr Hendrix's case, observed at Duke Hospital, of unilateral Horner's symptom complex of unknown origin After intravenous administration of Etamon the small Horner pupil enlarged some and was brought to the same size as the moderately dilated pupil of the normal side

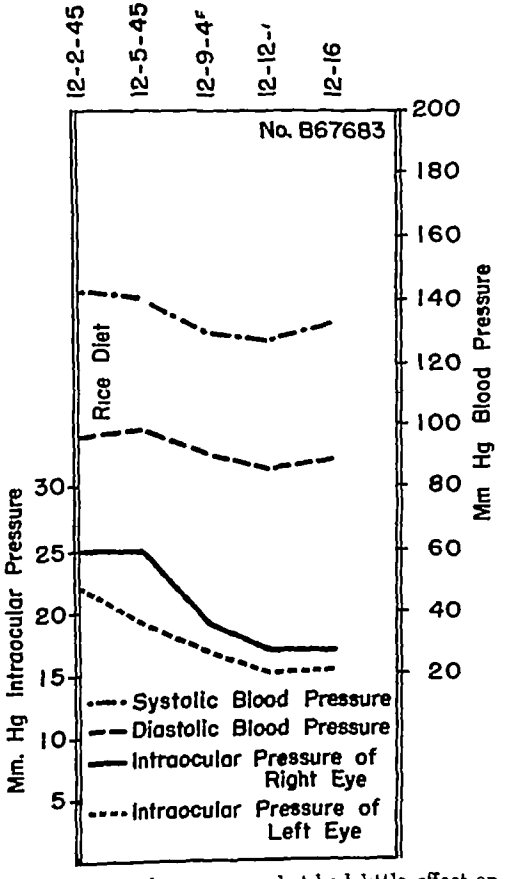

FIG 2 In this case rice diet had little effect on blood pressure but was followed by marked reduction of intraocular tension

as both sphincter and dilator became paralyzed on both sides Etamon also reduces the blood pressure temporarily In a case with occlusion of the central retinal artery we obtained a transitory reduction of the intraocular tension from 19 to 11 and 22 to 13 mm Hg, respectively It is possible that this observation might lead us to a new treatment of acute glaucoma Studies with a somewhat similar substance, Priscol, are also being done, but it is still too early to report any practical results

Attempts to influence the intraocular tension by drastically altering the composition of the blood serum have been successful in cases of acute glaucoma for a long time By injecting hypertonic solutions of salt or glucose intravenously, the osmotic pressure of the blood can be raised. Water will flow from the tissue into the blood. The eyeball, by losing part of its water content, may become softer Such drastic measures are obviously not applicable to chronic simple glaucoma Having witnessed the dramatic results of a strict rice diet given by Kempner at Duke Hospital in certain cases of cardiovascular-renal disease, we investigated what influence such a diet would have on the intraocular tension In 12 cases of general hypertension not suffering from glaucoma, the intraocular tension was taken before and after the rice diet was instituted All of them showed a marked reduction of the intraocular tension to a variable degree Reductions from 5 to 7 mm over long periods were not uncommon Most of the cases also reacted with a lowering of the systolic and diastolic blood pressure However, there was no definite parallelism between the drop of tension in the two systems Some cases that responded with a marked lowering of blood pressure had only moderately reduced intraocular pressure, whereas cases with a relatively poor response of the blood pressure would show a considerably lower intraocular pressure Control cases, which had been treated for arterial hypertension but which had not received the rice diet, showed a marked reduction in blood pressure but practically no lowering of the intraocular tension (Figs 2 and 3) *

The explanation of the phenomenon of the reduction in intraocular tension by the rice diet is still hypothetical For a while we thought that a relative depletion in chlorides of the tissues, brought about by the low chloride rice diet, might have something to do with it, but, recently, we are more inclined to attribute the drop in tension to a possible reduction in the secretion of sodium by the ciliary body This would be in line with the changes taking place in the kidney There

the base-peak range to be recorded after rutin treatment (Table 3)

The cases were then classified as improved, questionable, and not improved In order to be recorded as improved, a reduction of the peak pressure of about 15 per cent was considered to be significant enough. Smaller reductions were classified as questionable, or if the reduction was insignificant, as not improved The result was as follows improved 17, questionable 4, and not improved 5, making a total of 26 cases

The peak pressure was chosen for this classification partly because the base pressure was already within normal limits or even rather low in a number of cases One could hardly expect much change in those figures In the eight cases where the base pressure before rutin treatment was over 25 mg Hg (Schioetz) four were improved, one questionable, and three not improved

Case 15 deserves special attention It showed the most spectacular reduction in pressure after rutin was instituted The fact that in this case the tension rose after pilocarpine was used is apt to support the theory advanced above. First, the permeability of the blood-aqueous barrier was increased by the pilocarpine nullifying the beneficial effect of miosis After the blood-aqueous barrier was tightened by rutin, the miotic could display its full tension-reducing action (Fig 4)

The number of cases reported is not very large, certainly not large enough that percentage figures with statistical value could be drawn from their response to the combined treatment with miotics and rutin Nevertheless, the fact is quite impressive that, of 26 eyes, 17 would respond considerably better to miotics after they had been given 60 mg per day of rutin orally over a period of four weeks * The period of observation after the rutin treatment was instituted appears to be long enough to exclude largely the factor of coincidence It is most probable that rutin is able to reduce the permeability of the blood-aqueous barrier and thereby enhance the tension-reducing effect of miotics Therefore, rutin is to be regarded as a valuable adjuvant to the treatment with miotics and will make it possible to control a number of cases which would not be controlled by miotics alone, thereby averting or delaying surgery

* Recently we have given 60 mg of rutin three times a day It appears that even larger doses could be used without ill effects

SCIENTIFIC EXHIBITS
1949
ANNUAL MEETING

Applications for space for the scientific exhibits should be made directly to the Chairman of the Subcommittee on Scientific Exhibits of the Convention Committee

Dr J G Fred Hiss
505 State Tower Building
Syracuse 2, New York

The Annual Meeting will be held May 2 to 6, 1949, at the Hotel Statler in Buffalo

No applications can be considered after January 1, 1949

There will be two groups of awards

Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation.

Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts

W P ANDERTON, M D , *Secretary*

rutin ($C_{27}H_{30}O_{16}3H_2O$) was used This substance was isolated first from cured tobacco by the Eastern Regional Research Laboratory, United States Department of Agriculture, later from buckwheat and now is commercially produced

The experiments with rabbits had shown that no influence on the permeability of the blood-aqueous barrier could be observed after the animals had been fed 20 mg of rutin per day for three weeks If an animal prepared in this way received one drop of ½ per cent eserine three times a day for two days, the permeability of the blood-aqueous barrier to fluorescein was increased some, but in a control animal, which had not received rutin, the same treatment with eserine was followed by a much more pronounced increase in permeability

The clinical experiments were arranged in the following way * From a larger group of patients with various types of primary and secondary glaucoma that had received rutin, a group of 26 eyes with uncomplicated primary glaucoma in 15 patients was selected for final consideration The same kind of miotic was used during the whole period of observation A number of cases had to be excluded because the follow-up was not satisfactory, various miotics had been used, or the length of time under observation had not been sufficient Otherwise, the cases were unselected The tension was taken regularly for a variable period of time and as much as possible at the same time of the day Then, rutin, 20 mg three times a day, was given by mouth while the same type of miotic was used The tension continued to be recorded the same way at regular intervals The average length of observation after the institution of the rutin treatment was seven and eight tenths months, the shortest three months, the longest twenty-eight months, with exception of one case which did not respond and was operated on after one and a half months In order to get information on how the rutin treatment might have influenced the tension-reducing action of the miotic, the lowest and the highest reading during the periods before and after the rutin treatment was recorded The principle of base and peak tension, introduced by Reese, was adopted for these recordings and proved very illustrative.

Since rutin has a vitamin rather than a pharmacologic effect, a period of three to four weeks treatment will be necessary in order to expect a definite influence on the condition of the capillary walls Therefore, only recordings obtained four weeks after the rutin treatment had been instituted were considered for the establishment of

Mechanics of the Bronchial Tract

In order to understand the peculiar physical signs produced by nonopaque foreign bodies, it is important that one should have a basic knowledge of the mechanics of the bronchial tract during respiration It must be remembered that the bronchi are not rigid tubes and that during inspiration they elongate and widen Conversely, on expiration they become shortened and narrowed This constant change in the caliber of the bronchial lumen during respiration plays a major role in the production of the physical signs commonly found when foreign bodies invade the bronchial tract

As a rule, once a nonopaque foreign body, particularly those which are vegetal in type, becomes lodged in the bronchus, a local reaction soon follows, causing a severe edema of the bronchial mucosa which further increases the bronchial obstruction At first, the bronchi being normally widened on inspiration, the invasion of a bronchus by a foreign body produces only a partial obstruction during this phase of respiration. Sufficient space still remains between the foreign body and the bronchial wall to allow the ingress of air However, on expiration the situation becomes entirely reversed The bronchi now normally narrowed, the foreign body and the resulting local mucosal edema will, in varying degrees, obstruct the egress of air from that portion of the lung involved This state of expiratory obstruction results in a hyperdistension of the pulmonary segment distal to the obstructed bronchus In other words, a condition of obstructive emphysema is in the making The mechanics involved in producing this condition are often referred to as an expiratory check valve mechanism. If there is any delay in the removal of the foreign body during this stage of obstructive pulmonary emphysema, the increased mucosal swelling and accumulated secretions resulting from the prolonged local irritating action of the foreign body will now completely cork the bronchus, thereby preventing both the ingress and egress of air from that portion of the lung supplied by the obstructed bronchus The mechanism, which was previously only expiratory in type, has now changed to that of a complete check valve obstruction, and the state of the lung, formerly emphysematous, is now completely atelectactic

Even during this early stage of obstructive atelectasis, the removal of the foreign body and aspiration of the retained secretions will, in many instances, restore the lung to its normal function However, when atelectasis is allowed to exist for a period of time, the resulting pulmonary changes may prove to be irreversible This last stage of complete bronchial obstruction with subsequent pulmonary destruction might never be reached if every pediatrician and general practitioner of medicine considered the diagnostic possibility of aspirated foreign bodies as the causative factor in both children and infants who are suffering from obvious bronchial or pulmonary infection

Symptoms and Physical Signs

The symptoms and physical signs will vary with the degree of bronchial obstruction and the amount of interference with aeration and drainage of the subjacent portion of the lung involved Certain types of nonopaque foreign bodies, beans in particular, which, because of their chemical structure, possess the property of expanding or enlarging in the presence of moisture, may produce a rapid, complete bronchial obstruction, resulting in a massive atelectasis within a few hours following the intrusion Irritating vegetal bodies such as peanut kernels will usually set up a violent reaction immediately following the bronchial lodgement

Early in the beginning of obstructive emphysema, the symptoms are mainly those of laryngeal stridor, bronchial wheezing, cough, dyspnea, rapid pulse, and slight elevation of temperature If the aspirated foreign body is unusually large and becomes lodged in the laryngeal ventricle or trachea, in addition to the above symptoms there will also be present a marked retraction of the suprasternal fossa and indrawing of the abdomen in the xiphoid region Tracheal foreign bodies may quickly give rise to a bilateral obstructive emphysema, and the entire picture is often confused with bronchial asthma Sudden asphyxia and death may be the penalty for any delay in the removal of the foreign body The child or infant with marked respiratory difficulty is usually very restless, and, when closely observed, its body invariably is in the knee-chest position In obstructive emphysema inspection usually reveals a limited pulmonary expansion of the involved side The percussion note is slightly hyperresonant, and the diaphragmatic excursion is limited Auscultation reveals diminished or distant breath sounds with asthmatoid-like wheezing on the affected side

Roentgenologic Findings

In obstructive emphysema, the conventional x-ray films of the lungs will show a greater transparency on the obstructed side Figure 2 is a roentgenogram of an eight-year-old boy Made on deep expiration, it shows obstructive emphysema of the left lung due to a nonopaque foreign body partially obstructing the left main stem bronchus The difference in density of the lung fields can readily be seen since the left lung,

PHYSICAL AND ROENTGENOLOGIC FINDINGS IN THE EARLY DIAGNOSIS OF NONOPAQUE FOREIGN BODIES OF THE BRONCHIAL TRACT

ARTHUR Q PENTA, M D , Schenectady, New York

(From the Department of Broncho-esophagology Ellis Hospital)

NONOPAQUE foreign bodies, particularly in children and infants, present a most troublesome problem in diagnosis, since in many instances they are frequently overlooked as a diagnostic possibility It is only when severe pulmonary reaction has already taken place that these patients are sent to the bronchoscopist for examination Unfortunately, because of inadequate history and due to the fact that these foreign bodies are not visualized by the conventional x-ray films of the chest, many of these patients developing pulmonary symptoms are at first treated for bronchitis or pneumonia

The early diagnosis and localization of nonopague foreign bodies demands a thorough understanding and interpretation of physical and radiographic findings of the chest The altered normal mechanics of the bronchial tract during respiration caused by the lodgement of a foreign body and the subsequent pulmonary pathologic changes that follow can usually be demonstrated by a careful physical examination The data thus obtained, used in conjunction with a knowledge of the patient's history, symptoms, and x-ray findings will very often estimate accurately the location and extent of the bronchial pulmonary disease from which the patient is suffering

The abiding aim in the writing of this article is to provide a practical basis for the diagnosis of nonopaque foreign bodies In many instances, particularly in smaller communities, it is not unusual that the bronchoscopist is the first to be consulted regarding the existence of a foreign body in the bronchial tract Unless he is fortunate in having at his immediate disposal the services of a trained internist and radiologist, he must rely entirely upon his own ability to establish the diagnosis He must be able to carry out a complete physical examination of the chest in order to detect abnormal physical findings Moreover, he must be able to interpret his own x-ray and fluoroscopic study Fluoroscopy is by far one of the most important procedures in the diagnosis of nonopaque foreign bodies Furthermore, in all patients suspected of having a foreign body obstruction, lateral as well as anteroposterior roentgenograms should always be made Errors in diagnosis with subsequent delay in the removal of nonopaque foreign bodies may lead to a fatal outcome (Fig 1)

One of the most important considerations in the diagnosis of foreign bodies is a careful history In every child or infant, seen for the first time, who is suffering from obvious respiratory difficulty or pulmonary infection, the history obtained from the parents should always include information regarding recent attacks of coughing and choking while eating or drinking If wheezing is present, special note should be made regarding duration and mode of onset A careful history thus obtained may prove to be a very important clue in the diagnosis of aspirated foreign body In an excellent article written by Dr Lyman Richards in 1931, entitled "Forgotten Foreign Bodies", he states that the history of a foreign body is often available but must be extracted from parents who may fail to consider their suspicions of sufficient moment to mention them.[1]

FIG 1 Postmortem specimen of right lung showing a large piece of nut obstructing the right main stem bronchus Prolonged pulmonary suppuration resulted in this forty-six-year-old woman's death At no time during her illness had any thought been given to the possibility of a foreign body as the causative factor

Mechanics of the Bronchial Tract

In order to understand the peculiar physical signs produced by nonopaque foreign bodies, it is important that one should have a basic knowledge of the mechanics of the bronchial tract during respiration It must be remembered that the bronchi are not rigid tubes and that during inspiration they elongate and widen Conversely, on expiration they become shortened and narrowed This constant change in the caliber of the bronchial lumen during respiration plays a major role in the production of the physical signs commonly found when foreign bodies invade the bronchial tract

As a rule, once a nonopaque foreign body, particularly those which are vegetal in type, becomes lodged in the bronchus, a local reaction soon follows, causing a severe edema of the bronchial mucosa which further increases the bronchial obstruction. At first, the bronchi being normally widened on inspiration, the invasion of a bronchus by a foreign body produces only a partial obstruction during this phase of respiration Sufficient space still remains between the foreign body and the bronchial wall to allow the ingress of air However, on expiration the situation becomes entirely reversed The bronchi now normally narrowed, the foreign body and the resulting local mucosal edema will, in varying degrees, obstruct the egress of air from that portion of the lung involved This state of expiratory obstruction results in a hyperdistension of the pulmonary segment distal to the obstructed bronchus In other words, a condition of obstructive emphysema is in the making The mechanics involved in producing this condition are often referred to as an expiratory check valve mechanism. If there is any delay in the removal of the foreign body during this stage of obstructive pulmonary emphysema, the increased mucosal swelling and accumulated secretions resulting from the prolonged local irritating action of the foreign body will now completely cork the bronchus, thereby preventing both the ingress and egress of air from that portion of the lung supplied by the obstructed bronchus The mechanism, which was previously only expiratory in type, has now changed to that of a complete check valve obstruction, and the state of the lung, formerly emphysematous, is now completely atelectatic

Even during this early stage of obstructive atelectasis, the removal of the foreign body and aspiration of the retained secretions will, in many instances, restore the lung to its normal function However, when atelectasis is allowed to exist for a period of time, the resulting pulmonary changes may prove to be irreversible This last stage of complete bronchial obstruction with subsequent pulmonary destruction might never be reached if every pediatrician and general practitioner of medicine considered the diagnostic possibility of aspirated foreign bodies as the causative factor in both children and infants who are suffering from obvious bronchial or pulmonary infection

Symptoms and Physical Signs

The symptoms and physical signs will vary with the degree of bronchial obstruction and the amount of interference with aeration and drainage of the subjacent portion of the lung involved Certain types of nonopaque foreign bodies, beans in particular, which, because of their chemical structure, possess the property of expanding or enlarging in the presence of moisture, may produce a rapid, complete bronchial obstruction, resulting in a massive atelectasis within a few hours following the intrusion Irritating vegetal bodies such as peanut kernels will usually set up a violent reaction immediately following the bronchial lodgement

Early in the beginning of obstructive emphysema, the symptoms are mainly those of laryngeal stridor, bronchial wheezing, cough, dyspnea, rapid pulse, and slight elevation of temperature If the aspirated foreign body is unusually large and becomes lodged in the laryngeal ventricle or trachea, in addition to the above symptoms there will also be present a marked retraction of the suprasternal fossa and indrawing of the abdomen in the xiphoid region. Tracheal foreign bodies may quickly give rise to a bilateral obstructive emphysema, and the entire picture is often confused with bronchial asthma Sudden asphyxia and death may be the penalty for any delay in the removal of the foreign body The child or infant with marked respiratory difficulty is usually very restless, and, when closely observed, its body invariably is in the knee-chest position In obstructive emphysema inspection usually reveals a limited pulmonary expansion of the involved side The percussion note is slightly hyperresonant, and the diaphragmatic excursion is limited Auscultation reveals diminished or distant breath sounds with asthmatoid-like wheezing on the affected side

Roentgenologic Findings

In obstructive emphysema, the conventional x-ray films of the lungs will show a greater transparency on the obstructed side Figure 2 is a roentgenogram of an eight-year-old boy Made on deep expiration, it shows obstructive emphysema of the left lung due to a nonopaque foreign body partially obstructing the left main stem bronchus The difference in density of the lung fields can readily be seen since the left lung,

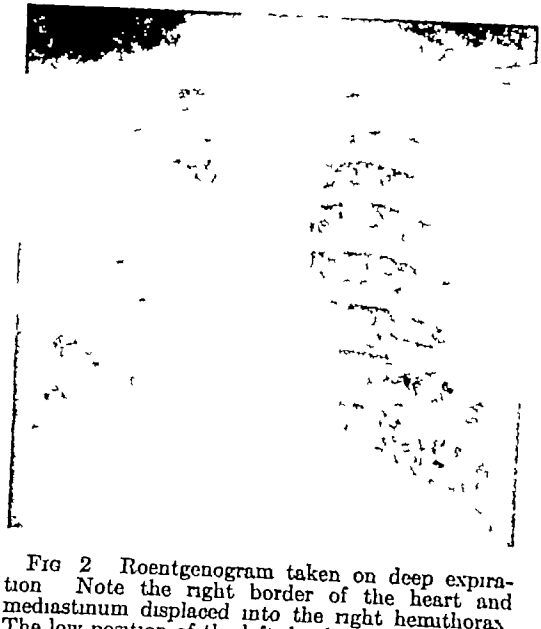

FIG 2 Roentgenogram taken on deep expiration Note the right border of the heart and mediastinum displaced into the right hemithorax The low position of the left diaphragm is abnormal in expiration.

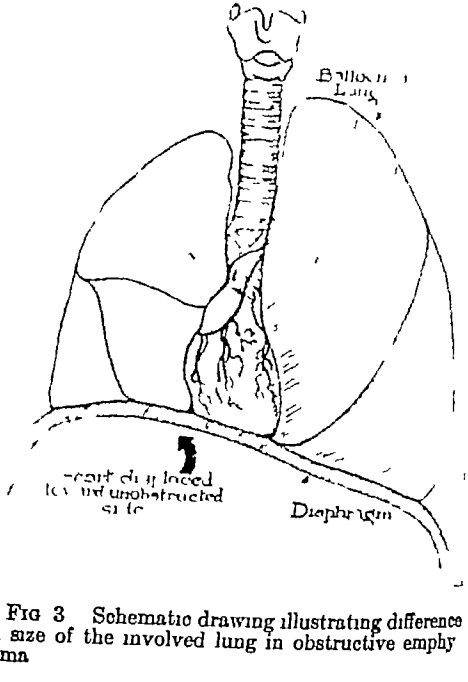

FIG 3 Schematic drawing illustrating difference in size of the involved lung in obstructive emphysema

being hyperdistended with air, is darker in appearance than the right lung If the ballooning of the lung is marked, the axis of the ribs is changed, resulting in a widening of the intercostal spaces

The dome of the diaphragm is, at first, only slightly depressed, but as the lung becomes more distended with air it tends to become flattened A very important finding is the slight displacement of the heart shadow toward the uninvolved side which appears more marked in films taken on expiration The limited diaphragmatic excursion on the obstructed side and the shifting of the heart shadow toward the uninvolved side during expiration is very diagnostic of obstructive emphysema (Figs 2 and 3)

Once obstructive atelectasis has developed, the physical signs and x-ray findings are completely changed Instead of a hyperresonant note on percussion, the note is now dull and borders on flatness Auscultation reveals the breath sounds to be extremely distant or entirely absent The x-ray findings now reveal a marked density of the pulmonary area involved, the intercostal spaces are narrowed, the diaphragm is elevated and the mediastinal structures are now displaced toward the affected side due to the increased negative pleural pressure (Fig 4) Figure 5 is a schematic drawing illustrating the relative disproportion in size of the involved lung in massive atelectasis Fluoroscopic examination reveals a dense homo-

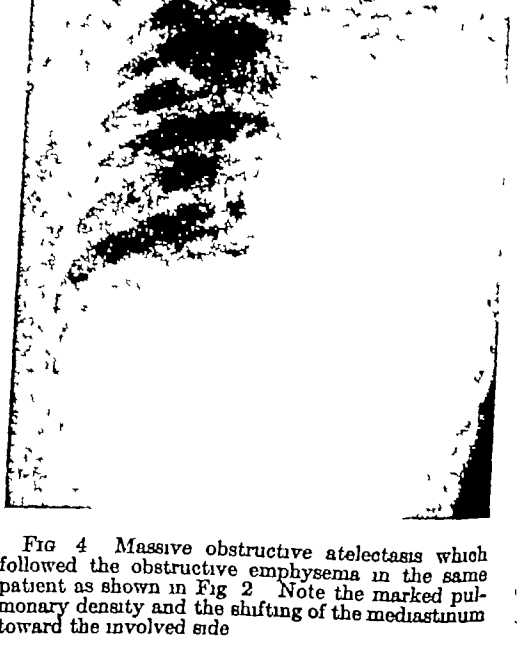

FIG 4 Massive obstructive atelectasis which followed the obstructive emphysema in the same patient as shown in Fig 2 Note the marked pulmonary density and the shifting of the mediastinum toward the involved side

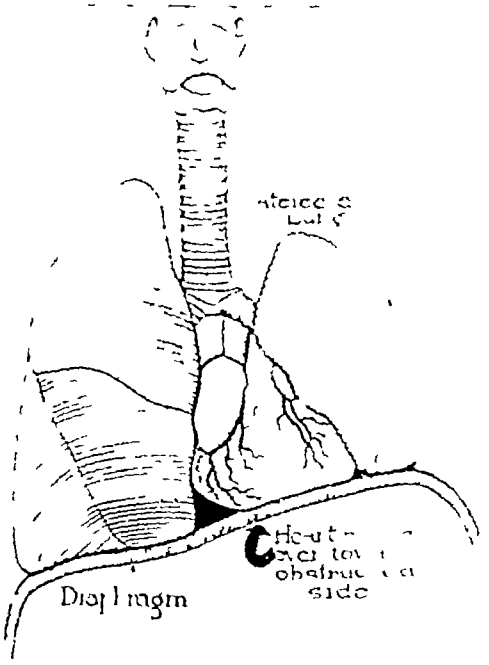

FIG 5 Schematic drawing illustrating the appearance of the involved lung in atelectasis

geneous shadow with arrested diaphragmatic movement on the involved side

Pulmonary Complications

During the stage of obstructive emphysema the majority of patients with nonopaque bronchial foreign bodies will make an uneventful recovery following the early bronchoscopic removal of the offending agent However, if there is any delay in the removal of the foreign body, massive atelectasis will soon follow The error and delay in diagnosis in the case of this boy resulted in beginning empyema (Fig 6) A thoracotomy with tube drainage was performed on the patient, but no improvement followed this operation The patient was referred for bronchoscopic examination Even at this late stage no thought had been given to the possibility of a foreign body obstruction as the cause of the patient's illness Figure 7 is a roentgenogram taken two weeks after the endoscopic removal of the foreign body, which proved to be the rubber sac of a fountain pen (Fig 8)

The usual sequence of events which generally take place when obstructive atelectasis is allowed to go untreated for a period of time is pulmonary suppuration with abscess formation, perforation of the lung, and pyopneumothorax In a certain

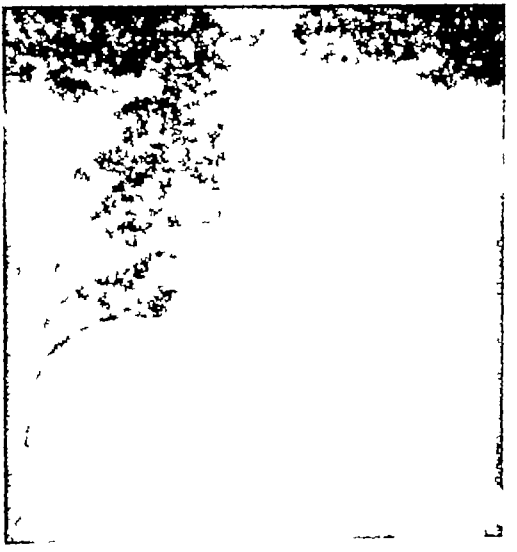

FIG 6 Roentgenogram of same patient taken two weeks later showing the pulmonary complications which eventually follow if obstructive atelectasis remains untreated

percentage of cases, a marked destruction of the bronchial wall takes place, with the subsequent formation of bronchiectasis

Treatment

It is imperative that, in patients developing the above complications, thoracic surgery in some form or other be resorted to immediately as a life-saving measure Chemotherapy should always

FIG 7 Roentgenogram taken two weeks after removal of foreign body

FIG 8 *Nonopaque foreign body which has remained in the left main stem bronchus of patient for eight weeks*

be instituted as a routine procedure following the bronchoscopic removal of bronchial foreign bodies Follow-up x-ray study should always be done to exclude the presence of a second foreign body which may have been overlooked during the first examination No patient should be discharged from the hospital following the removal of a foreign body unless the physical examination and x-ray findings reveal the lung involved to be completely aerated and regaining its normal function

Summary

Nonopaque foreign bodies in the bronchial tract if not removed early may cause severe and fatal pulmonary destruction Adequate history and special attention to the physical and x-ray findings are of the utmost importance in the diagnosis of nonopaque foreign bodies Inadequate history and misinterpretation of the physical findings when a patient is first seen may lead to irreversible pulmonary damage In all children and infants presenting the symptoms of laryngeal stridor, cough, bronchial wheezing, dyspnea, and elevation of temperature, the possibility of aspirated foreign body should always be strongly considered as a diagnostic possibility, and no time should be lost in seeking bronchoscopic consultation

TREATMENT OF LEUKEMIAS AND LYMPHOMAS

In the October, 1948, issue of *California Medicine*, Howard R Bierman, M.D , discussed the newer methods of treatment in these serious conditions and summarized them as follows

The early localized lesion of a lymphoma which shows no evidence of spread to other areas is best treated by wide surgical excision followed by maximum, intensive x-ray irradiation

Total body irradiation appears to be the treatment of choice for chronic myelogenous leukemia in most instances Radioactive phosphorus (P^{32}) is as effective, but the current difficulty of obtaining and handling the material limits its use to research institutions Other radioactive elements as therapeutic agents at this time are neither as effective nor as practical for use as x-ray irradiation in treating neoplastic disease of the lymphoma group

There has been no authenticated cure of any of the lymphomas and leukemias through treatment with any of the many chemotherapeutic agents tried in the past twenty years

The nitrogen mustards have been shown to arrest the course of Hodgkin's disease in the majority of cases, but the change is temporary In general, patients with Hodgkin's disease who have had no previous therapy have responded better and for longer remissions than those who have had x-ray therapy and are no longer responding favorably

Urethane will alter the course of chronic myelogenous leukemia favorably, but the change is transient, and no permanent benefit has resulted yet.

The mycosis fungoides and neoplastic disease of the giant follicular lymphoma group also respond favorably to the nitrogen mustards, the response being similar to that noted in the Hodgkin's disease group The nitrogen mustards are a valuable adjunct to x-ray therapy in the treatment of Hodgkin's disease, mycosis fungoides, and giant follicular lymphoma.

The remainder of the lymphomas and leukemias have shown transient response to the nitrogen mustards but in a much smaller percentage of patients.

Folic acid derivatives, such as pteroyldiglutamic acid and pteroyltriglutamic acid, are as yet unproved as effective palliative agents in any of the lymphomas and leukemias

The administration of a folic acid antagonist, 4-aminopteroylglutamic acid, has been followed by temporary remissions in some cases of acute leukemia in children There is no basis at this time for considering this compound as more than an arresting agent in some cases

Many other agents are being actively investigated for their effect upon neoplastic diseases None of these, however, can be recommended for general use as yet

THE PRESENT STATUS OF THE FENESTRATION OPERATION

J Morrisset Smith, M D , New York City

IT HAS been known since the early part of the eighteenth century that the hearing could be restored in certain types of deafness by making an opening in the capsule of the internal ear, either through the horizontal, posterior, or superior semicircular canals or in the cochlea Unfortunately, these results were always transient, with the hearing improvement disappearing in a short time. Despite the use of various types of grafts, fatty tissue, and the wide variety of technics employed, the results were always the same

These sporadic attempts to restore permanent hearing continued throughout the eighteenth century without success In the early part of the nineteenth century, the attempt to relieve the deafness due to otosclerosis was given a decided impetus by the work of Barany, Jenkins, Holmgren, and other noted otologists, but the results were still not permanent in any way and the work was criticized by many aural surgeons

In the early twenties of the nineteenth century, Soudille of France conceived the brilliant idea that, if a fistula could be made in the internal ear and then covered with a previously prepared very thin plastic skin flap, permanent hearing might be maintained He reasoned that, if the site of the fistula could be first prepared by furnishing the proper access to it, then at the second operation, the plastic skin flap properly constructed, and finally at a third operation, the fistula established and covered by the delicate plastic skin flap, closure of the fistula might be prevented and a permanent hearing improvement maintained

This highly constructive thinking has resulted in the present, successful fenestration operation Soudille attacked the problem by choosing the horizontal semicircular canal as the site of the fistula and preparing the proper access to it by the removal of the bone in the posterosuperior canal wall, together with the dense bone forming the external wall of the attic and including the bottom of the bridge forming the upper part of the tympanic ring This permitted complete access to the attic space and allowed the removal of the incus and the head of the malleus During this operation, extreme care was taken to separate and preserve intact the delicate layer of skin continuous with the drum membrane and lining the posterior superior canal wall This procedure he designated a "combined atticotympanotomy" This was allowed to heal, and after several months, a plastic flap was constructed from the carefully preserved skin and placed over the site of the fistula with the air space in the tympanum properly maintained He designated this the "internal plastic operation" A few months later, this carefully prepared skin flap, which by this time had become very thin, was gently elevated and the fistula established with an electric burr The flap was then replaced, sealing off the area of the fistula and the epitympanic space Soudille gave a report on the surgical treatment of otosclerosis in England in 1930 and in America in 1934

The prospect of a three-stage operation extending over a period of two years or more was not popular with the laymen or the aural surgeons After an intensive period of preparation, Lempert correlated the different steps of the above technic into a one-stage operation and first performed it as such in 1938 The fenestra was made over the barrel of the semicircular canal, and, while permanent and successful results were obtained, the percentage of good results was small but extremely encouraging The plan of leaving the incus in position and removing the head of the malleus was tried and discarded The next improvement was made by Lempert in 1941 when he moved the site of the fistula forward from the barrel of the semicircular canal to the space over the dome of the vestibule just anterior to the ampullated end of the horizontal canal This was an important contribution and improved the results

The complex nature of the anatomy of the mastoid and the middle and internal ears, together with the very intricate conducting and perceiving mechanism, including the membranous labyrinth, presents many problems to the aural surgeon However, the intensive work and research by the operators seriously interested in this work has resulted in a very fine contribution to the management of otosclerosis One of the important contributions to this progress has been the proper classification of the types of deafness which may or may not be benefited by the operation

In the beginning, there was much confusion concerning the indications for the operation There were conflicting reports concerning successful operations in mixed types of deafness and even cases with very advanced nerve deafness This led to a thorough trial of both these types with full consent of the patients and demonstrated very conclusively that lost nerve function could not be restored by the fenestration operation

It is, therefore, primarily an operation for conduction deafness, and it will not restore the hear-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section in Ophthalmology and Otolaryngology May 21 1948

hip, where there is a complete destruction of the nerve trunk, there is a certain impairment in most of the cases. In a very large percentage of the cases, the damage to the bearing is a gradual process. In the early stages, the bone conduction of nerve function shows very little impairment, even though the air conduction is considerably reduced. As the condition progresses, the nerve slowly but gradually loses function so that over a long period of time the hearing loss, which began as a conduction deafness, changes to a mixed type with nerve damage and finally ends with a complete nerve deafness and a total loss of hearing in the affected ear.

This emphasizes the very important fact that the ideal time for the intervention to restore the hearing is during the conduction stage of the deafness and that the chances of the operation successfully restoring the hearing decrease in direct proportion to the increase in the loss of bone conduction or loss of nerve function.

The operation to put Eustachi tube should be used. A previous mistaken or unfruitful intention does not prevent a successful tympanoplasty operation provided the tube often has been catheterized and the drum healed. Many of the so called catarrhal deafnesses are included in this category. The primary requisite for the operation is the presence of the necessary residual nerve function that is, when the nerve studies is made, enough nerve impulses must get to the internal ear and the hearing restored. The term "residual nerve function" by the writer, is used to designate the type of deafness suitable for the operation.

Another important consideration in the operation is the amount of improvement in the hearing, in the beginning it required from nine hours to complete it. This time has been reduced to two hours or less in the hands of a competent surgeon, due principally to the better control of the bleeding and the proper anesthetic. The blood is best controlled by using the proper epinephrin, novocain, sodium and cocaine and supplementing them during the operation as necessary, in order to avoid the use of a general anesthetic. Complete control is essential to some of the dangerous after effects of the operation. Where it is necessary to open mastoid process at the same time, a doubt in regard to the time may be expected.

The major problem still confronting this operation is the use of bone to replace the destroyed and eroded ossicles to relay the sound vibrations of the tympanic membrane to the inner ear. Some of the materials used in the attempt to restore hearing have been the use of small metal substances, the use of cosmoids, gold, bone, celluloid, the cartilage of the ear, and other material placed on the edges of the drum. Much of this research has been carried out in animals, but finally must be tried out in patients. Unfortunately, none of them have been able to prevent the formation of new bone to fill more of the drum than is within the head. The best bone used to bridge the gap, it was found that a large number of the patients have continued to enjoy good practical hearing even after the fact that continued research may find a method of preventing the closure of the drum.

Problems of Partial Nerve Deafness

When there is residual bone conduction still the air conduction will below the 25 decibel loss in the three important speech frequencies, the chances of getting practical hearing are poor and the indication for operation very slight. The real problem is presented to both the patient and the aural surgeon when there is a partial loss of nerve function resulting in a mixed type of partial nerve deafness.

When the loss of nerve function is limited and the nerve has not been severely damaged, there is still a chance to shut the progress of the disease and preserve practical hearing for the patient. The fact that a partial impairment of nerve function will prevent a perfect result should be explained to the patient if operation is advised in this type of case. It must be remembered that although such is a progressive disease, and it is rare for an arrested and the hearing maintained at the 30 or even 40 decibel level, a distinct service has been rendered the patient. Undoubtedly the operation for restoration in cases of the cases of partial nerve deafness. Where there is a serious impairment of nerve function, operation will result in no improvement in the deafness than an improvement in the hearing very definitely contraindicated.

Secondary Operations

It was my feeling in the early [illegible] that [illegible] happen [illegible] the new [illegible] [illegible] [illegible]

being a secondary removal is very short and usually completed in a few days

The reason for delaying the secondary removal of the new bone over the fistula is to allow the plastic skin over the fenestra to become as thin as possible, and also the additional time results in a diminished blood supply to the new bone and membranous tissues over it It is my belief that blood is one of the chief causes of failure in this operation. This is especially apt to be true in the occasional case where, with the best indications and a perfect technic, the hearing is either diminished or not improved

The most plausible explanation is bleeding into the vestibule through the fistula after the flap has been placed in position Therefore, it is especially important in the revision that the flap be elevated with the least possible trauma and the bleeding controlled before the fistula is again established and the flap replaced

Two important factors in the technic have had a very material bearing on the results in my experience with the operation The first is the excessive flushing of the cavity with sterile water or normal salt solution during the operation Repeated syringing of the cavity with a stream of solution during the operation, especially with the cortex off and the semicircular canals exposed, results in an almost continuous caloric test similar to the one made by the use of hot and cold water to test the function of the vestibular labyrinth In many instances, the patient has been nauseated and dizzy, with vomiting lasting twenty-four to forty-eight hours in cases where no operation has been performed The excessive use of water during the operation has the same effect, only in a more exaggerated form, and directly contributes to the postoperative labyrinthitis with prolonged nausea, vomiting, and dizziness This does not mean that the bone chips and the bone dust must not be removed during the operation. However, the reduction in the amount of irrigation used has resulted in a marked reduction in the postoperative labyrinthitis Some of the patients have been allowed to get out of bed on the third and fourth day with no ill effects At the conclusion of the operation, before the fistula is made, all available bone chips are removed with cotton-tipped applicators, the smaller ones are then removed by gentle irrigation and suction

During the construction of the fistula a minimum amount of solution is used—just enough to remove the bone dust adequately When the fistula is outlined and the endosteum exposed, all bone dust should be removed by very gentle irrigation and suction Once the endosteum has been removed with the needle and a communication established, excessive irrigation may partly replace the normal labyrinthian fluid with water, thereby contributing to the labyrinthitis, and may interfere with the hearing improvement

The second and more important factor concerns the operative technic in the middle ear and attic space In an effort to improve the results and perform a technically perfect operation, the three semicircular canals were thoroughly outlined, the cells removed in the gutter over the superior and semicircular canal, some of the cellular structure removed in the middle ear to the dural plate in the middle fossa, and the dissection carried too far ahead of the malleus Then the pyramidal eminence was lowered to the *limit, together with the facial ridge practically to* the facial nerve This perfect technic produced, in effect, a radical operation with the skeletal bone so removed that the flap, when placed in position, came in contact with the internal wall of the middle ear with most of the air space in the middle ear eliminated A very active fistula with excellent bone conduction resulted, but the hearing by air conduction was reduced instead of improved

At one period there was a distinct drop in the percentage of successful results It is my opinion at this time that it was directly caused by the technic described above and that better results will be obtained where sufficient skeletal bony structure is allowed to remain at the bottom of the bridge in the roof of the attic and over the region of the eustachian tube in order to maintain properly the air space in the tympanum and prevent the plastic flap from flattening out against the internal wall of the middle ear

It seems to me that better hearing results are obtained with fewer bony closures of the fenestra where the cellular structures in the region of the fistula are allowed to remain as nearly intact as possible and the fistula is established with the least possible trauma to the surrounding bony tissues Both of these factors are controversial, but are well worth careful consideration

There is also a difference of opinion concerning the partial or complete removal of the mastoid cells during the fenestration operation Some operators believe the hearing results are better with a partial removal of the cells Others feel that a complete exenteration of the cells is best

Present Status of the Operation

With the problem of bone regeneration still unsolved and the increasing number of men engaged in the operation and research, it is only natural that there should be a difference of opinion regarding some of the steps of the technic A frank discussion of these problems and reports by the otologists interested in the fenestration operation should result in a continued improvement in the technic and a possible solution to the bony closure of the fistula

ing where there is a complete deafness or where there is a serious impairment or loss of nerve function In a very large percentage of the cases, the damage to the hearing is a gradual process In the early stages, the bone conduction or nerve function shows very little impairment, even though the air conduction is considerably reduced As the condition progresses, the nerve slowly but gradually loses function so that over a long period of time the hearing loss, which began as a conduction deafness, changes to a mixed type with nerve damage and finally ends with a complete nerve deafness and a total loss of hearing in the extreme cases

This emphasizes the very important fact that the ideal time for the fenestration to restore the hearing is during the conduction stage of the deafness and that the chance of the operation successfully restoring the hearing decreases in direct proportion to the increase in the loss of bone conduction or loss of nerve function

The operation is not limited to true otosclerosis cases A previous middle ear or mastoid infection does not prevent a successful fenestration operation provided the infection has long since subsided and the drum healed Many of the so-called catarrhal deafness cases are included in this category The primary requisite for the operation is the presence of the necessary residual nerve function so that, when the new window is made, sound waves may again be conveyed to the internal ear and the hearing restored The term, "clinical otosclerosis," is, therefore, best used to designate the type of deafness suitable for the operation

Another important contribution to the operation is the marked improvement in the technic In the beginning, it required five or more hours to complete it This time has been reduced to two hours or less in the hands of a competent operator, due principally to the better control of the bleeding and the proper anesthesia The blood is best controlled by using the proper sedation, nembutal, neonal, and demarol and supplementing them during the operation as necessary, in order to avoid the use of a general anesthetic Morphine should be avoided because of its depressing effect on the respiration Where it is necessary to give gas and oxygen or ether, a decided increase in the bleeding may be expected

The major problem still confronting this operation is the one of bone regeneration Despite all the research and efforts to solve it, a small percentage of the fistulas will be closed by new bone

Some of the methods used in the attempt to prevent this have been the use of small metal obturators, the use of smooth gold burnishing burrs, the cartilage stopple, and other metal abrasives on the edges of the fistula Much of this research has been carried out in animals, principally monkeys, and some in patients Unfortunately, none of them have been able to prevent the formation of new bone in all cases at the time this is written The lead burr now is being thoroughly tried The fact that a large number of the fistulas have remained open with good practical hearing encourages the belief that continued research may find a method of preventing the closure of the fistula

Problems of Partial Nerve Deafness

Where there is excellent bone conduction with the air conduction well below the 25-decibel level in the three important speech frequencies, the chances of restoring practical hearing are good and the indications for operation very clear The real problem is presented to both the patient and the aural surgeon when there is a partial loss of nerve function resulting in a mixed type or partial nerve deafness

When the loss of nerve function is limited and the nerve has not been seriously damaged, there is still a chance to check the progress of the disease and preserve practical hearing for the patient. The fact that a partial impairment of nerve function will prevent a perfect result should be explained to the patient if operation is advised in this type of case It must be remembered that otosclerosis is a progressive disease, and if it can be arrested and the hearing maintained at the 30- or even 40-decibel level, a distinct service has been rendered the patient Otologists frequently disagree on the indications for operation in some of the cases of partial nerve deafness Where there is a serious impairment of nerve function, operation will result in an increase in the deafness rather than an improvement in the hearing and is very definitely contraindicated

Secondary Operations

It was my feeling in the early stages of this work that there was great danger of destroying the membranous labyrinth when attempting to remove the growth of new bone over the fistula Secondary operations on a number of cases have successfully removed the new bone, restoring and maintaining practical hearing without damage to the membranous labyrinth It is especially indicated when a practical restoration of hearing has resulted and then gradually decreased to its preoperative level over a period of several weeks or months There must be good bone conduction with a minimum or negative response to pressure over the region of the fistula Several months should elapse before the second operation

Where there is a very active fistula with no improvement in the hearing following the first operation, a second operation will not benefit the patient Where the bone has not closed the fistula and a fibrous covering is encountered, attempt to remove it may seriously damage the membranous labyrinth The postoperative healing time fol-

TUBERCULOUS FISTULA

LOUIS S KNAPP, M.D., Buffalo, New York

(From the Buffalo General Hospital)

IT IS not the intention to give a classical description of the various forms of anal tuberculosis in this paper. Also I am not interested in terminal tuberculosis and the forms of anal pathology that go with it. The subject resolves itself then to the tuberculous fistula which has a definite possibility of cure.

It is still common belief that it is dangerous to interfere with tuberculous fistula and that nothing can be done to cure it. It is felt that if healing occurs it will be long and tedious and seldom complete. Many of the physicians treating tuberculosis still are of the opinion that it is useless to try surgery of any description. In ordinary fistula surgery, how often we hear, 'This fistula must be tuberculous because it heals so poorly." This is usually an excuse for inadequate surgery and bears out the general feeling that tuberculous fistula is a more or less hopeless condition. In reference books such quotes as, "The operation should be done with the object of establishing free drainage rather than with the object of curing the fistula and there should be as little cutting as possible." (Mummery) [1] Also, "Excision of the fistula and immediate closure of the wound with sutures should not be attempted whenever tuberculosis is suspected."

"The dense fibrous wall of scar tissue about the sinus is our patient's protection against widespread tuberculosis. The sinuses should be laid open with cautery in the usual manner and all necrotic tissues and granulations are seared out until the fibrous base is exposed." (Drueck) [1]

Both authors later admit that healing is slow and prolonged. I would expect it to be so with either form of treatment, since either case has not had removal of pathology.

With the great improvement in the general tuberculosis outlook, we will have increasing numbers of patients who have had tuberculosis and have become arrested cases. The development of the various forms of surgical treatment in reference to the primary lesions of the chest has saved the lives of many cases that otherwise would have been hopeless. This increasing group of people will swell somewhat the numbers who will be susceptible to anal fistula. Many of the arrested cases have developed a tuberculous sinus or fistula in later years, often so long afterwards that the history has to be obtained by direct questioning after you find a suspicious looking anal fistula. Often the response is that, "I had a light case many years ago and was completely cured. What does that have to do with my rectum?"

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Gastroenterology and Proctology, May 19, 1948.

Incidence

The incidence of tuberculous fistula has been a subject of discussion which has shown a wide divergence of opinion. It was not so many years ago that the belief that "fistula was tuberculous in the majority of cases" was prevalent [1]. Today we know that this is not so. The literature shows reports of an incidence of 1.7 per cent in Bacon's cases to 61 per cent reported by Melchior. Such variations cannot be accurate, regardless of the conditions or the methods involved. With this in mind we reviewed the subject of fistula at the Buffalo General Hospital. We felt that as a general hospital with the usual admissions we could obtain some fair estimate of the incidence of tuberculosis in fistula. Upon examination of the records over a stated period of time we found that there were 705 fistulas of the anus and rectum. Of this number we found 13 tuberculous cases, or an incidence of 1.8 per cent. This bears out the feeling, I believe, of most of the proctologists engaged in this work.

Naturally, it is true that in the incidence of tuberculous fistula in the average sanitarium there will be much higher figures. The average figures approach 78 per cent. Even in a tuberculosis hospital you will find the ordinary pyogenic fistula in many cases regardless of a primary focus in the chest.

The history and symptoms of a tuberculous fistula are quite in contrast to that of the pyogenic fistula. There is no question about the onset of a pyogenic fistula with the acute abscess so distressing to the patient. With the tuberculous fistula there is no acute onset but a mild and insidious one that is often only recognized when the drainage occurs. Many will say, "I never noticed a thing until I found my clothing soiled with a sticky substance." The discharge is also rather characteristic, being serous and sticky with a somewhat musty odor. The pyogenic fistula has the typical creamy thick discharge of the usual infections. The serous discharge of the tuberculous fistula is almost continuous with no evidence of healing over, so typical of pyogenic ab-

A detailed report of my personal experience with the work was presented in the third report of 425 fenestration operations in the March edition of the *Southern Medical Journal* Full credit is given to the *Journal* for the material from that report used in this article

The operation as it stands today has been proved to be a thoroughly sound and accepted surgical technic which has restored practical hearing in a large number of clinical otosclerosis cases which previously had never been helped by any means other than a hearing aid

The writer is cognizant of the claims made in the literature of the beneficial effects of histamine and vitamin injections, electric vibration, massage, and the various other local treatments A careful test of the hearing in a series of cases of clinical otosclerosis by the tuning forks, spoken voice, and the audiometer show identical results—a gradual but progressive loss of hearing both by bone and air conduction over a period of time . In the past these patients consulted specialist after specialist and were told by the conscientious ones that nothing could be done to check or prevent their loss of hearing in this type of deafness Removal of the tonsils and adenoids together with any nasal obstruction and inflation of the eustachian tubes in an effort to check the progress of the deafness were advised without any real benefit to the true otosclerosis cases

It has been proved to be practically free from danger other than the minimum risk incurred in any major surgical operation The laity by now is generally aware of the fact that the operation is not successful in every case and has accepted it as an opportunity to have the hearing successfully restored in a good percentage of the cases with the proper indications

Conclusions

1 The fenestration operation restores practical and lasting airborne hearing in a good percentage of the properly selected cases of clinical otosclerosis

2 The ideal indications for the operation are present during the conduction stage of the deafness

3 The chances of a successful operation decrease in direct proportion to the increase in the loss of nerve function

4 The operation is definitely contraindicated where there is a serious loss of nerve function or a complete nerve deafness

Discussion

Robert L Moorhead, M D, *Brooklyn*.—A few years ago considerable skepticism was expressed as to the efficacy of the fenestration operation Many statements were made insisting that the results would not be permanent and that in time the windows would close When the cases recovered with good hearing, it was demanded that these cases should be observed for two years, then three and finally five years before being called permanent results Now, many of us have cases that have retained good hearing for seven, eight, and ten years so that now the most doubtful otologist must admit that the fenestration operation is restoring permanent, good hearing in many cases

This brings up the question of which patients will be benefited by the operation In general, we may divide our patients into three classes One, those that are ideally suitable, second, those that are obviously unsuitable and are easily excluded, and there is a third class of patients coming in between these two that are responsible for many of our difficulties All cases of otosclerosis develop some degree of nerve degeneration in time, many in the early stages but fortunately most of them late It is the determination of the amount of nerve degeneration that is the difficult part of our problem The audiometer, the tuning forks, and the hearing tube all have their place in estimating the amount of cochlea reserve in a given case However, all of our tests are subjective and may vary with the intelligence and mental alertness of the patient What we really need is an objective test, in which the cooperation of the patient is not necessary

I would recommend that every otologist, even though he himself is not performing fenestration operations, should acquaint himself with the determination of bone conduction in his patients Numerous cases are referred and recommended for operation and then on careful testing are found to be unsuitable This often causes resentment in the patient toward the otologist who has referred him and he is at a loss to understand the divergent views and is very liable to consider that the referring otologist was either neglectful or ignorant of his condition Accuracy in testing of the bone conduction would obviate many of these embarassing situations.

I know a number of otologists that still recommend that their patients obtain a hearing aid rather than have the fenestration performed While it is true that good hearing may be obtained with an aid in most cases, I have yet to see a patient who would willingly wear one after a successful operation, and patients are universally disappointed if they must continue wearing aids for one reason or another Furthermore, while wearing an aid, the hearing continues to decline so that more and more amplification of the sound is necessary for comfort Eventually, the hearing aid is not satisfactory but by that time, the patient is unsuitable for operation and has lost his only chance for restoration of hearing

Results are more and more promising with the work The reactionary labyrinthitis has been greatly reduced in the last few years, so that one rarely sees a failure on account of it Whether or not the burnishing of the window by pure lead will further improve our results is as yet an undetermined point, but certainly the results to date are most encouraging The fenestration operation has proved itself, is here to stay, and will in time be regarded as the greatest advance in otology in our lifetime

TUBERCULOUS FISTULA

LESTER S KNAPP, M D , Buffalo, New York

(From the Buffalo General Hospital)

IT IS not the intention to give a classical description of the various forms of anal tuberculosis in this paper Also, I am not interested in terminal tuberculosis and the forms of anal pathology that go with it The subject resolves itself then to the tuberculous fistula which has a definite possibility of cure

It is still common belief that it is dangerous to interfere with tuberculous fistula and that nothing can be done to cure it It is felt that if healing occurs it will be long and tedious and seldom complete. Many of the physicians treating tuberculosis still are of the opinion that it is useless to try surgery of any description In ordinary fistula surgery, how often we hear, "This fistula must be tuberculous because it heals so poorly " This is usually an excuse for inadequate surgery and bears out the general feeling that tuberculous fistula is a more or less hopeless condition In reference books such quotes as, "The operation should be done with the object of establishing free drainage rather than with the object of curing the fistula and there should be as little cutting as possible " (Mummery) [1] Also, "Excision of the fistula and immediate closure of the wound with sutures should not be attempted whenever tuberculosis is suspected "

"The dense fibrous wall of scar tissue about the sinus is our patient's protection against widespread tuberculosis The sinuses should be laid open with cautery in the usual manner and all necrotic tissues and granulations are seared out until the fibrous base is exposed " (Drueck) [1]

Both authors later admit that healing is slow and prolonged I would expect it to be so with either form of treatment, since either case has not had removal of pathology

With the great improvement in the general tuberculosis outlook, we will have increasing numbers of patients who have had tuberculosis and have become arrested cases The development of the various forms of surgical treatment in reference to the primary lesions of the chest has saved the lives of many cases that otherwise would have been hopeless This increasing group of people will swell somewhat the numbers who will be susceptible to anal fistula Many of the arrested cases have developed a tuberculous sinus or fistula in later years, often so long afterwards that the history has to be obtained by direct questioning after you find a suspicious looking anal fistula Often the response is that, "I had a light case many years ago and was completely cured What does that have to do with my rectum?"

Incidence

The incidence of tuberculous fistula has been a subject of discussion which has shown a wide divergence of opinion It was not so many years ago that the belief that "fistula was tuberculous in the majority of cases" was prevalent [1] Today we know that this is not so The literature shows reports of an incidence of 1 7 per cent in Bacon's cases to 61 per cent reported by Melchior Such variations cannot be accurate, regardless of the conditions or the methods involved With this in mind we reviewed the subject of fistula at the Buffalo General Hospital We felt that as a general hospital with the usual admissions we could obtain some fair estimate of the incidence of tuberculosis in fistula Upon examination of the records over a stated period of time we found that there were 705 fistulas of the anus and rectum Of this number we found 13 tuberculous cases, or an incidence of 1 8 per cent This bears out the feeling, I believe, of most of the proctologists engaged in this work

Naturally, it is true that in the incidence of tuberculous fistula in the average sanitarium there will be much higher figures The average figures approach 78 per cent Even in a tuberculosis hospital you will find the ordinary pyogenic fistula in many cases regardless of a primary focus in the chest

The history and symptoms of a tuberculous fistula are quite in contrast to that of the pyogenic fistula There is no question about the onset of a pyogenic fistula with the acute abscess so distressing to the patient With the tuberculous fistula there is no acute onset but a mild and insidious one that is often only recognized when the drainage occurs Many will say, "I never noticed a thing until I found my clothing soiled with a sticky substance " The discharge is also rather characteristic, being serous and sticky with a somewhat musty odor The pyogenic fistula has the typical creamy thick discharge of the usual infections The serous discharge of the tuberculous fistula is almost continuous with no evidence of healing over, so typical of pyogenic ab-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Gastroenterology and Proctology May 19 1948.

scess The usual pyogenic abscess fills and drains, opens and reopens, whereas the tuberculous never seals over

The external opening has an appearance also characteristic, there is a bluish cyanotic area of the skin with a glistening surface In the center of this area there may be a somewhat ragged opening, or there may be several fine pinpoint openings There is no evidence on palpation of a fibrous, raised, healing ring so typical of the pyogenic When this area is palpated, there is a countersunk or depressed area that often admits the tip of the finger Palpation for the fistula tract running into the anus will not reveal that fibrous tract so typical of the pyogenic fistula

The internal opening in the majority of cases arises in the crypts of Morgagni, as does the majority of all fistulas I cannot agree with the appearance of the internal opening as described in most textbooks The ordinary fistula has the crypt and large papilla as an indicator for the internal opening due to the inflammatory reactions This is not the case in the majority of tuberculous fistulas The crypts and papillae do not show the enlargement of the papilla like the pyogenic, and it is more difficult to determine which crypt or crypts that area involved until the fistula is opened

Many authors describe a large, ragged and palpable internal opening This has not been my experience except in the terminal stages or non-surgical cases I have found that the internal opening of the pyogenic fistula is much easier to determine than the tuberculous by proctoscopy

Methods to determine the tuberculous character of fistula have consisted of Ziehl-Neelsen stain, guinea-pig inoculation, and histopathologic examination

The first two methods have shown such an element of error that they have been discarded in most hospitals C L. Martin has shown by his work the impossibility of using these methods with any accuracy [2] We believe that the histopathologic examination is the most exact method for the determination of tuberculous fistulas. This determination is not always accurate since it depends on the experience of the pathologist and the willingness to do repeated or serial sections to find the Langhan's giant cells and the characteristic tubercle formation.

The differential histopathologic diagnosis between the tubercle, foreign body granuloma, lymphogranuloma, or gumma can be determined by the study of the giant and epithelioid cells, description and number of the lesions, tissue structure, and lymphocytes and plasma cells. The following table will show some of the most important points of differential diagnosis (Table 1)

Indications for surgery in these cases can be fairly well classified It is unnecessary to note that any tuberculosis case that is rapidly failing and shows anal breakdown is not a suitable case for surgery Some cases, however, that have not stabilized and have inadequate drainage should be relieved of the additional load by conservative measures Any case that shows stability in handling the primary lesion with improvement in the general condition can be operated The removal of the anal lesion will relieve further the infection load, and a boost is given the patient for his general health and recovery

We do not operate any anal or rectal lesion that has proved tuberculous lesions of the bowel However, after the bowel lesion has been taken care of, the fistula, if present, can be operated on

TABLE 1 —Differential Diagnosis

	Tubercle	Foreign Body Granuloma	Lymphogranuloma Venereum	Gumma
Giant cells	Common. Nuclei at periphery	Very numerous Nuclei all over cell plus foreign material within the cell	Unusual	Rare
Epithelioid cells	Very numerous Definitely arranged in tubercle formation	Mononuclear Macrophages not arranged in tubercular fashion	Large number of epheloid cells frequently palisading about necrotic tissue	Less numerous
Description of lesion	Caseation Absent blood vessels. Absent fibroblasts from necrotic area	Characterized by focal nodules containing also fibrous and granulation tissue. Macrophages fuse to form multinucleated giant cells	Looks like tubercle bacillus with addition of purulent inflammation with irregular or stellate shaped abscesses containing many polyps and densely packed mononuclear cells In rectum there are miliary infiltrations of the muscularis by lymphocytes and ulceration of the mucosa	Blood vessels sometimes present. Fibroblasts may be found in center
Tissue structure	Completely obliterated	Still visible	Still visible	Often still visible
Number of lesions	Rarely single	Usually single	Usually multiple	Frequently single
Lymphocytes and plasma cells	Less numerous than in gumma	Less numerous	Very numerous	Very numerous Perivascular

patients who have had lung surgery for arrest of lung lesions with good results are not contraindicated for surgery. Any arrested case or cases of medical or surgical treatment are acceptable for fistula surgery.

Procedure

In describing the operation we have done on tuberculous fistulas we have broken about all of the old principles that are quoted in the textbooks. Earlier in this paper I made two quotes from well-known men and now I am about to do just what was said not to do. I wish to describe the type of fistulectomy and also the use of sutures we have employed.

The fistulas have to be divided into three classifications, first, the true fistula with internal and external openings, these having their origin in the crypts of Morgagni. This invasion is believed to be secondary to ingestion. We have found that this type is the one that is most common. The second group is classified as sinus inasmuch as there is no internal opening into the anus or rectum. They arise from a breakdown of tuberclesand it is felt that this infection is lymphatic or hematogenous-borne. Fistulas that are secondary to bone or other tuberculous organs and are not usually susceptible to curative surgery constitute the third group. These are usually failing and terminal cases where life is questionable. The first and second groups are amenable to surgery if they fulfill the previous indications.

After the actual fistulous area has been prepared with adequate exposure of the anal region, the countersunk external opening is opened and the edges caught by Allis forceps for good vision. The appearance of the fistula is funnel-shaped with the large end of the funnel distal. As the tract approaches the anal ring, it becomes smaller and will lead to one or more crypts. This tract is carefully incised to the crypt to expose the full length of involvement and the amount of undermining of the skin. Often the area is quite extensive. With full exposure, dissection is carefully started distally, removing completely the involved area including the so-called protective fibrous layer. We are very careful to avoid any breaks of this layer for fear of secondary dissemination. It is necessary to incise the tract first for exposure of involvement, otherwise a dissection often cannot be done without breaking through where it is undermined. There is no tubular fibrosis so characteristic of the ordinary progenic fistula, so that small areas may be left with the consequence that the operation is unsuccessful.

In closure of the often large external defect we use a nonabsorbable suture, usually Kalderman, in a mattress type, passing first a wide suture through skin below the defect and not through any of the space. The suture is then passed through both edges of the skin and tied over pearl buttons. This type of suture will close all dead space in the cavity, and will last long enough for proper healing before removal. The closure is extended to the anal margin leaving the last portion for drainage of the anal canal. This last V-shaped area is lightly packed with oxycel gauze. The sutures are removed after five to seven days. The perirectal sinuses are widely dissected and closed in the same manner without drainage.

I wish to mention streptomycin and some of the findings that have been observed. First, I have given pre- and postoperative cases 1 Gm. per day as a precautionary measure and I feel that it does have some merit in this category. In following the reports of treatment at Perrysburg Hospital there seems to be a pattern in practically all cases under treatment, regardless of chest, kidney or other manifestation of tuberculosis. In the first thirteen weeks most cases showed a marked and miraculous improvement especially in the bacillary count. After this period the count rose rapidly and the cases seem to be even in worse condition than before treatment.

Sinus and fistula followed the same pattern with improvement under streptomycin with decrease of discharge and apparent healing of the lesions. When the general count reverted becoming streptomycin-fast the fistulas and sinuses also changed for the worse.

Recent work has shown that better results with less dosage may be accomplished in the future. However, so far streptomycin will have to serve as a boon to the surgeon for preparation for surgery and postoperative protection.

Summary and Conclusions

1. Tuberculous fistulas are not so prevalent as quoted in the literature.
2. We should dispel the idea that tuberculous fistula is not amenable to surgery.
3. We should use curative methods of surgery in tuberculous fistulas.
4. Streptomycin is not a cure-all but does have a function and a place in our armamentarium.

Discussion

A. W Martin Marino, M.D., *Brooklyn* — I am in perfect accord with the essayist's statement that only about 2 per cent of all fistulas in ano are tuberculous, and I most emphatically do not subscribe to the statements of many writers such as Volkman,

Konig, Melchior, and Goz that the majority of all rectal fistulas are tuberculous in origin [1 2] I would add that primary tuberculosis of the anorectum is extremely rare and that it is usually secondary to pulmonary tuberculosis Both tuberculous and nontuberculous fistulas in ano are more commonly found in men than in women No satisfactory explanation of this has been advanced

Just as Doctor Knapp said, anorectal tuberculosis is insidious in its onset, and for that reason it is well to perform frequent, periodic anorectal examinations on tuberculous patients, for only in that way can these lesions be discovered early The earlier these anorectal lesions are diagnosed, the less extensive need be the surgery, and the sooner is the patient relieved of an additional tuberculous burden

There has been considerable controversy as to the method of arriving at a diagnosis of tuberculous fistula in ano and how to distinguish them from nontuberculous fistulas Anyone who has seen a substantial number of proved tuberculous fistulas with their characteristic changes knows that there is a distinct difference in their appearance as compared to the nontuberculous fistulas As a matter of fact, the clinical picture in tuberculous fistulas is so characteristic that on many occasions in office and hospital practice it has been possible to discover the presence of otherwise unsuspected pulmonary tuberculosis from the appearance of the anorectal lesion Roentgenograms of the lungs, sputum examinations, and gastric washings have confirmed the diagnosis in such cases That unsuspected pulmonary phthisis may be present in patients harboring tuberculous fistula in ano is shown by the fact that in our series of 42 cases of proved tuberculous fistulas there was a history of pulmonary involvement in nine cases that was not discovered until several weeks to seventeen years after the development of the anorectal lesion Inasmuch as the diagnosis of tuberculous fistulas can only be proved in the laboratory, either by examination of the scrapings taken from the edematous granulations which line the tracts or by examination of the removed fistula, the importance of as accurate a preoperative diagnosis as possible is self-evident In my work, if I suspect that a fistula in ano is tuberculous, I treat it as if it were tuberculous Multiple serial sections are examined in the laboratory, and the final diagnosis is made by the pathologist Here again, I am in accord with Doctor Knapp, for we too depend on histopathologic examinations for the final diagnosis.

I shall not discuss the use of streptomycin in tuberculous fistulas because I have not employed it for that condition We know that there are disadvantages and dangers which accompany its use, and minimal as these may be, I have chosen to leave its use to the tuberculosis specialist I have used it in preparation of the bowel for colonic surgery, but we are not discussing that field here

One of the most significant findings in the study of the 42 patients with proved tuberculous fistula in ano, which I mentioned, was that the postoperative course in tuberculous patients in the quiescent phase with negative sputa and gastric washings was short and favorable, as in nontuberculous patients In patients with positive sputa, however, healing took about twice as long These findings convinced me that the optimal time for the institution of operative measures is when the patient's sputum is negative, or when the pulmonary disease is in a quiescent phase with the number and concentration of tubercle bacilli greatly diminished In considering these findings one cannot help but feel that the swallowing of positive sputum is an important factor not only in the production of tuberculous fistula in ano but also in the postoperative convalescence

So far as treatment is concerned, I cannot go along with Doctor Knapp In surgery about the anorectal region, I have found that the closure or partial closure of wounds is attended by pain, infection, prolonged convalescence, and failure of the operation to accomplish what the surgeon intended. I perform the same type of operation on tuberculous fistulas as I do on the ordinary kind, excepting that in performing fistulectomy in the tuberculous variety, I include more of the surrounding healthy tissue and disturb the local disease as little as possible The wounds are not sutured in any way but are left wide open to assure adequate drainage and proper healing I agree wholeheartedly with the speaker, however, that tuberculous fistulas are amenable to surgery

A M.A FILM GETS CERTIFICATE OF MERIT

At a recent convention of the Biological Photographic Association held in Philadelphia, the A M A. awarded a certificate of merit The film was first shown at the A M A centennial session in Atlantic City in 1947 by the A M A Committee on Medical

Case Reports

PREGNANCY COMPLICATING OSTEOGENIC TUMOR OF THE SACRUM*

PHILIP B WAHRSINGER, M D , F A C S , and J IRVING KUSHNER, M D , F A C S ,
New York City

(*From the Department of Obstetrics Bronx Hospital*)

A JEWISH housewife, S T , was first seen in the prenatal clinic on November 9, 1944 Her menstrual cycles, which began at the age of twelve, were of the thirty-day type with a four-day flow There was a history of amenorrhea since July 24, 1944 Her expected date of delivery, therefore, was April 30, 1945

Her past history revealed an appendectomy in 1930 with an uneventful convalescence In 1937 she was seen at the Hospital for Joint Diseases because of vague pelvic pains. A tumor of the sacrum was found The diagnosis of a benign osteogenic tumor or an ossifying giant cell tumor was made by biopsy She was treated for this by means of a radium pack on June 20, 1937, and received 10,575 milligram-hours Two months later, she received another 14,500 milligram-hours.

Between October, 1937, and December, 1937, at Sydenham Hospital, she received twelve additional x-ray treatments to the sacrum, a total of 2,400 roentgen units Following this, she had a period of amenorrhea for one year

On February 11, 1943, at Montefiore Hospital, an x ray examination showed a large mass 8 cm. in diameter, arising from the lower end of the sacrum. Upon review of the slide taken at the Hospital for Joint Diseases in 1937, the diagnosis was now made of ossifying fibroma At this hospital she was checked at regular intervals without any changes in the clinical picture being found She received no further therapy, but on October 14, 1944, because of amenorrhea since July, an Aschheim-Zondek test was made and found to be positive She was then transferred to our prenatal clinic

On admission to the Bronx Hospital no abnormalities were found except for a bony tumor felt on pelvic examination about 7 5 cm. from the outlet, apparently arising from the sacrum and separate from the promontory

A pelvic x-ray revealed a normal inlet and midpelvis, a slightly contracted outlet, and a large calcified mass in the region of the sacrum and coccyx, measuring 7 5 by 7 5 cm. This mass protruded into the pelvic canal. The patient was considered a candidate for a cesarean section, since it was felt that this tumor would make a vaginal delivery impossible

After a normal prenatal course, on April 19, 1945, eleven days before her expected due date, a rectal examination revealed a vertex presentation with the head well engaged in the left occipito-anterior position. It was now felt that she would deliver vaginally On May 18, 1945, after a ten-hour labor, she was delivered by low forceps of a living female child, weighing 7 pounds 12 ounces. The baby had a depressed fracture of the right frontal bone, apparently where the tumor mass had pressed on the head during the passage through the birth canal. This cleared up spontaneously, and mother and baby left the hospital in good condition on the tenth postpartum day

A two-year follow-up of the baby showed no abnormal findings.

The patient was next seen again in the prenatal clinic on March 27, 1947 Her last menstrual period was December 10, 1946, and her expected date of confinement was September 17, 1947 She was referred to the tumor service for study A large osteomatous growth, roughly 7 by 7 cm. in size, involving the anterior surface of the lower end of the coccyx and sacrum, was found This projected about 8 cm from the anterior surface of the coccyx and sacrum An x-ray film showed no change from the previous condition It was the opinion of the tumor service that no surgery was indicated for the sacral lesion and no abortion was justifiable However, it was felt that the patient should have an elective cesarean section and fallopian tube ligation in view of the previous history of the infant's skull fracture.

The obstetric staff thought, however, that she should be allowed to deliver vaginally After a normal prenatal course the patient was admitted to the hospital in active labor on September 11 1947, with the cervix fully dilated. A low forceps delivery was was done because of sudden fetal distress and a living 7-pound, 8-ounce boy was delivered with a depressed fracture of the right frontal bone in the same area of the skull as had been found in the first child. Except for this, the baby showed no abnormalities, and a neurosurgical consultation advised against operation Both mother and baby were discharged on the ninth postpartum day in good condition

The baby was seen in the follow-up clinic on December 11, 1947 No abnormalities were present The depression of the skull had cleared up

The depression having occurred in the frontal region in both babies, only subsequent observation will determine if any permanent damage had been caused in the so-called silent areas of the brain.

MICROPHTHALMIA ASSOCIATED WITH A VARIETY OF CONGENITAL ANOMALIES IN THREE SIBLINGS*

BERNARD KRONENBERG, M D , New York City

(*From the Gouverneur Hospital*)

THE syndrome presented consists of a basic microphthalmia which is associated with a number of other congenital lesions in three siblings The family consists of eight children with normal parents who were first cousins Five of the children were normal. Three of these five have a total of six children all of whom are normal Of the original eight, three show this basic syndrome, microphthalmia

Case Reports

Case 1 —Carlos N , age nineteen, has microphthalmia, coloboma of the iris, marked nystagmus, and eyes fixed in convergence of both eyes At the age of twelve days, he developed an external ocular infection which led to the formation of a corneal opacity of the right eye involving almost the entire cornea, leaving only a lunar-shaped sector up and out He shows a coloboma of the right iris which is not typical but is located at five o'clock. This eye shows a myopia of −25 00 The left eye, as a result of this infection, has a dense leukoma adherens, posterior synechiae, and absorption of most of the lens substance, leaving only a calcified area below The vision of the right eye is 4/400 and cannot be corrected The left eye has only hand movements The fundus of the right eye could not be seen very clearly because of the marked nystagmus and the corneal opacity

Case 2 —Carmen N , age sixteen, has microphthalmia with ectropian uvea of both eyes and ectasia of the pupils. She also shows coloboma of the optic nerve and macular area and marked nystagmus, and the eyes are fixed in convergence The vision of the right eye is 6/400, and the left has fingers at one foot. Fundus examination of the right eye, which was the only one possible, shows myopia of −24.00 The right eye also showed remnants of a hyaloid artery and a posterior lens opacity The left eye, in addition to the abovementioned anomalies, has a subluxation of the lens with coronal lens opacities and a persistent pupillary membrane

Case 3 —Celia N , age fifteen, has microphthalmia but not so marked as that of her brother and sister She also shows a coloboma of the iris, optic nerve, and macula She, too, has a marked nystagmus, and her eyes are fixed in convergence The vision is 6/400 in each eye, and she has a myopia of about −24 00 She is the least affected member of the siblings

The patients presented here were the children of first cousins who must have carried the basic anomaly as a recessive characteristic The fact that it has appeared in two girls and one boy also substantiates that it is not sex-linked These patients fall into the second and third groups of the Van Duyse classification Both the mother and father could not recall any other relatives with similar eye defects The consanguinity and appearance of three members in the same family, of course, eliminates the possibility of any intrauterine inflammatory processes causing these anomalies

It seems to me that only one defective gene for a basic anomaly was transmitted by each parent. Certainly, it would be difficult to assume the transmission of many defective genes for each of the various anomalies seen in this family The complete normality of the other children also eliminates the possibility of more than one defective gene. I must assume that the basic anomaly here was a defect in the ectodermal anlage delaying the closure of the fetal cleft which caused the microphthalmia The appearance of colobomata of the iris, typical and atypical, coloboma of the optic nerve, ectasia of the pupil, and luxation of the lens must all be secondary to the basic anomaly and were determined during pregnancy by incidental factors The high myopia can only be explained on the basis of a spherical change in the lens The nystagmus is explained by the presence of colobomas in the macular area

Summary

Three siblings with microphthalmia and a variety of other congenital lesions are presented Their parents are first cousins and have a total of eight children Of the five normal children, three have a total of six children, all of whom are normal.

The patients have an ectodermal defect Their anomalies are recessive in character Most probably, one defective gene was transmitted by each parent for the basic anomaly The appearance of all the other anomalies were secondary and were determined during pregnancy by incidental factors

AUXILIARY NURSING SERVICE PLEDGED

"The nursing profession is responsible for providing safe nursing service to the public The national professional nursing organizations have accepted this responsibility ever since their founding

"The national nursing organizations now recognize the essential nature of services needed by the sick from practical nurses and auxiliary workers They are ready to assume full responsibility for leadership and guidance "—*Practical Nurses and Auxiliary Workers for the Care of the Sick, 1947*

To which we say, hurrah!—*Editors*

CARCINOMA OF THE PROSTATE*

A STRACHSTEIN, M D , New York City

(From the Department of Urology, Beth David Hospital)

THE statistics gathered by Young in 1936 reveal that one fifth of the male patients who seek relief of obstruction of the vesical neck have carcinoma of the prostate gland [1] The statistics of Rich and Moore have been frequently and widely quoted in urologic literature Essentially, they are as follows In 292 autopsies on men over fifty years of age at the Johns Hopkins Hospital, Rich found carcinoma of the prostate gland in 41 cases or 14 per cent, in 68 per cent of these cases the tumor had not been detected because it was too small to produce symptoms [2] In 1935, Moore found cancer of the prostate in 21 per cent of 252 patients between forty-one and ninety years of age [3] Although until a few years ago carcinoma of the prostate had always been considered a trying and discouraging malady, the newer androgenic treatment recommended by Huggins and his associates in 1941 holds out a ray of hope for these unfortunates [4,5]

Case Report

D P a white man of sixty-five, was referred to me by his physician early in 1944 for the treatment of a hydrocele The hydrocele was removed, and the patient made an uneventful recovery On January 5, 1946, the patient was referred again, this time complaining of hematuria, frequency, and dysuria.

Rectal examination revealed a hard nodular prostate with a stony, hard consistency in some areas Cystoscopic examination was impossible because of the density of the prostatic urethra. No x-ray films were taken at that time, but the blood showed a definite acid phosphatase elevation A diagnosis of carcinoma of the prostate was made In view of the advanced stage of the growth we did not advise surgical removal There was also no indication for transurethral resection.

The patient through my advice was treated by his family physician until November 25, 1947 with diethylstilbestrol injections, supplemented orally by tablets of the same drug The urinary symptoms had completely abated He gained weight and was coming along very satisfactorily until the latter part of November, 1947 He then began to complain of terrific headaches, abdominal pain, and a chain of neurotic symptoms Examination at that time (November 25, 1947) showed the prostate to be perfectly soft and not enlarged, consistency was normal with disappearance of the previously found nodular masses, and there was no dysuria.

Radiologic examination, however, revealed the presence of metastases in the pelvic bones and in the lumbar spine Although no x-ray films were taken when we first detected the malignancy of the prostate, we had reason to suspect that they were present then and were checked by the estrogenic therapy There was no residual urine found, but the acid phosphatase was still elevated

Castration was now advised and was performed on November 26, 1947 It is remarkable to note that his headaches had completely disappeared within two days and now, to quote his own words, "feels fine and never better" At the present time six months after the orchiectomy he is free from symptoms He is still taking the diethylstilbestrol orally The rationale for continuing the estrogenic therapy is the following We know that the adrenals are secreting a certain amount of androgens even after orchiectomy, hence neutralization is produced by the continuance of the stilbestrol.

It is difficult to explain the severe headaches in this case, and it is equally difficult to explain the relief obtained after orchiectomy Metastases in the skull from carcinoma of the prostate are rarely, if ever, found We are justified in concluding that this mode of treatment may prolong the life of the patient even longer than a radical prostatectomy if we are to judge by results following prostatectomy for carcinoma of the gland

PHYSICIANS PER POPULATION IN U S

In a recent compilation by *Medical Economics* (November, 1948), the statement is made that in the United States there is one private physician for each 1,082 people The ratio in New York State is claimed to be 1 640

Most doctors per population are found in the District of Columbia, where an active, private physician is available for each 582 people Fewest such medical men in relation to population are found in Mississippi, which has one per 2,420 people Professional competition is also at a peak in New York, Massachusetts, Colorado, Connecticut, Vermont, New Jersey, Maryland, Illinois, and California. Each of these areas has fewer than 1,000 people for every active, private physician

Besides Mississippi, medicine is least competitive in Alabama, Arkansas, New Mexico, and South Carolina

Special Article

ARE PHYSICIANS PARTICULARLY SUSPECT OF TAX FRAUD?

CURT GRUNEBERG, T D , Kansas City, Missouri

Department of Economics, University of Kansas City

APPROXIMATELY one and a half years ago, an article appeared in the February, 1947, issue of *Fortune* magazine This article, entitled "The Ingenious Taxpayer," contained the following statement "Hippocrates would be surprised to learn that there have been more doctors convicted of tax evasion than any other group except professional gamblers" Apparently, no one has paid any attention to this remark about the tax honesty of physicians Nevertheless, it should be of special interest to every physician to discuss *sine ira et studio* whether and to what extent there may be any truth in this statement

Tax fraud has rapidly become a major problem to the tax authorities and a serious threat to our national economy Additional tax assessments between 1930 and 1941 were—with few exceptions—between three and four hundred thousand dollars Since 1942, the assessments have increased in an alarming degree

FISCAL YEAR	ADDITIONAL TAX ASSESSED
1942	$ 438 000 000
1943	566 000 000
1944	731 000 000
1945	922 000 000
1946	1 280 000 000
1947	1 929 000 000

According to a recent statement by A L M Wiggins, Undersecretary of the Treasury, the Federal government loses about one billion dollars a year through fraudulent tax evasion The loss through nonfraudulent tax losses is estimated at about four billion dollars a year and the loss in accumulated tax evasions at least five billion In order to minimize this loss, the Treasury Department attempted to get a substantial increase in personnel, a move which was defeated by Congress

How does the Treasury Department make the best of an unsatisfactory number of personnel, especially of the small Internal Revenue Bureau's intelligence unit? It is well known that regular audits or at least repeated audits refer to taxpayers in the upper tax brackets, whereas taxpayers in the lower brackets, especially as far as they receive most of their income from employment, get more or less a routine check only However, a second, rather efficient check method is not well known, namely, the selection of taxpayers for tax audits on the basis of their profession or occupation. It may be a very unpleasant surprise to many physicians, but it is a fact that doctors' tax returns are given particular attention by the Treasury Department

What is the reason for this attitude on the part of the Treasury Department, and does it justify the statement quoted earlier? Actually, the comment on physicians and tax evasions is wrong with respect to two factual statements (1) There are no statistics on tax convictions of any professional or occupational group This in itself shows that the statement cannot be backed up by facts (2) In addition, "professional gamblers" are, of course, neither an occupational nor a professional group of taxpayers The Treasury Department, while it has made surveys and investigations of specific occupational and professional groups of taxpayers, has no classification of "professional gamblers" Moreover, since gambling—under local law—is frequently liable to punishment, the comparison of physicians with professional gamblers as to tax honesty does not indicate any actual fact, but only the personal, not very flattering attitude toward physicians of the author of the article in question.

Nevertheless, there seems to be something wrong with tax returns of doctors One small analysis of cases concerning the frequency of tax evasions in any occupation, prepared by the Treasury Department, would indicate that doctors were the second largest category of persons involved in the small group of cases under consideration Incidentally, the first place in this survey as to frequency of tax evasion was occupied not by professional gamblers but by persons in the liquor industry

It is true that the Treasury Department has selected nine categories of occupations or professions whose tax returns are given particular attention for tax audit purposes Physicians are one of these nine groups, apparently for the following reasons (1) lack of detailed financial records which, according to the experience of the Treasury Department, is customary in the medical profession, and (2) a large portion of medical fees is paid in cash, and control of cash is always difficult

Yet, this particular attention by the Treasury Department to doctors' tax returns may change for the better More and more patients are paying their medical bills by check rather than in cash, more and more patients who still pay in cash ask their doctor for a receipt in order to have proof for tax deduction under Section 23(v) of the Internal Revenue Code, and more and more doctors are being convinced of the necessity for satisfactory records of their income

Although it is obviously true that a few doctors are found guilty of tax evasion from time to time, it is not fair to generalize in a way which reflects on the integrity of the profession as a whole The Treasury Department has developed a method of tax control and supervision which requires a verification of tax returns of a relatively large number of members of the medical profession But this is certainly not an indication of any critical attitude of the Treasury Department toward the medical profession as such, or toward its individual members

CORRESPONDENCE

THE TREATMENT OF PNEUMONIA

To the Editor

I am referring to the article in the JOURNAL of August 1, 1948, p 1735, Clinicopathologic Conferences on Bacterial and Virus Pneumonias, and shall appreciate it if you will permit me to make a few remarks and ask a few questions in connection with the two cases and the way they were managed

It appears that Case 1 was an elderly man who had had a coronary occlusion two years ago, was in chronic heart failure and contracted a pneumonia He had taken digitalis "sporadically" and had stopped it three days before the onset of the present acute illness It is difficult to judge how much digitalis they have taken, but from experience I can say that such people need seven to ten tablets of digitoxin, 0 1 mg, to get them out of heart failure, administered within the first twenty-four to thirty-six hours and maintained on 0 1 or 0 2 mg a day This man received 0 2 mg a day and would have required ten to twelve days to become digitalized He did not live long enough. My question is Is it accepted practice to underdigitalize a man in heart failure if he contracts a pneumonia?

In Case 2 we see an elderly man succumb to pneumonia on the eighth day after his temperature has returned to normal The autopsy showed 2,000 cc fluid in *each* pleural cavity and some more fluid in adhesions In other words, the chest contained over 4 L. of fluid. My question is Are 4 or more L. of pleural fluid compatible with life? Is it common practice not to tap a chest filled with fluid to such an extent?

I realize that the chance of both patients was small, but for my own and other general practitioners' information I would like to hear your comment on my questions and shall appreciate anything you wish to say authoritatively

ERNEST LEIBHOLZ, M D
54-55 69th Lane
Maspeth, New York
August 12, 1948

To the Editor

In reply to Dr Liebholz I should like to point out that the major problem in Case 1 was the pneumonia and not the heart failure, which was only moderate in degree at the time of admission Since the amount of digitalis that the patient had taken was not known, it seemed wiser to avoid rapid digitalization and to give full doses of mercuhydrin I quite agree that heart failure complicating pneumonia should not be underdigitalized.

In regard to Case 2, there was no clinical or radiographic evidence of large pleural effusions, which were very likely preterminal developments Large effusions should, of course, be aspirated, although the presence of 4,000 cc of pleural fluid is not incompatible with life. The hazards of hydrothorax vary considerably and depend on a number of factors which include the size of the effusion, the location, the degree of encapsulation and fixation, the rate of accumulation, and the underlying disease.

I hope that these remarks will be of aid in the interpretation of the two case presentations

DIABETES AND TUBERCULOSIS

To the Editor

The NEW YORK STATE JOURNAL OF MEDICINE of July 15, 1948, includes an article on the management of diabetes complicated by tuberculosis

On the basis of one case and some literature dated 1939, the conclusion is drawn that protamine zinc insulin has a toxic effect and that it is not valuable in the treatment not only of diabetes but especially of diabetes complicated by tuberculosis

In the first place, protamine zinc insulin has now been used in the treatment of diabetes for more than ten years, and there is scarcely any opinion that it is the cause of constant toxic effects

In the second place, in 1941 Mosenthal and Mark in the *J.A.M.A.* of June 14, 1941, page 2652, reported the treatment of 278 cases of diabetes complicated by tuberculosis as treated at Sea View Hospital. The cases were about evenly divided between those treated with regular insulin and with protamine zinc insulin, in all other respects the therapy was the same in both groups It was found that the control of diabetes with the protamine zinc insulin was infinitely more effective than with the regular insulin

Consequently, I would conclude that the statements made in the article were based on insufficient evidence and that we have no proof that protamine zinc insulin is a universally toxic medication and that protamine zinc insulin is less efficient than crystalline zinc or regular insulin in the treatment of diabetes complicated by tuberculosis. In fact, it seems that protamine zinc insulin is far and away the more efficacious in the control of tuberculosis in the presence of diabetes.

HERMAN O MOSENTHAL, M.D
889 Lexington Avenue
New York 21, New York
August 18, 1948

To the Editor

Reply is made to the foregoing letter from Dr Herman O Mosenthal who comments on our paper "The Management of Diabetes Complicated by Tuberculosis," which appeared in the NEW YORK STATE JOURNAL OF MEDICINE 48 1613 (July 15) 1948

It was not unexpected at this time to have clinicians such as Dr Mosenthal and others of his standing draw conclusions different from those expressed in *our summary* However, the recent literature is, nevertheless, increasing with reports regarding the toxic effect of protamine These damaging effects may have left their marks on the cardiovascular, peripheral vascular, pulmonary, ocular, and genitourinary systems Over a long period of clinical observation of the exclusive use of protamine zinc insulin, I have found the following blood chemistry changes

1 Increased blood cholesterol.
2 Increased blood uric acid
3 Increased blood creatinine
4. Some disturbance in the albumin-globulin ratio
5 Depression of the renal threshold for glucose

I have also discussed a syndrome, "protamine edema," noted clinically in a number of cases treated with protamine zinc insulin exclusively All of the above findings seem reversible when regular insulins are substituted

Reference may also be made to the work of Wildstrom and Willander [*Acta med Scandinav* 88 434 (1936)] who found that heparin prevented fibrinous adhesions in pleurisy, while Chagraff and Olson [*J Biol Chem* 122 153 (1937)] have shown that protamine (salmine) annuls the action of heparin both in vitro and vivo

Because of all these observations and studies, it is not unreasonable to presume that many thrombotic phenomena in diabetics have been due, at least in part, to the inhibiting influence of this foreign protein substance (protamine) on circulatory dynamics, especially since protamine has been shown to counteract the action of heparin The view of Shelley *et al* [*Proc Soc Exper Biol & Med* 50 300 (1942)] that protamine tends to favor vascular embolic incidents may be explained on the basis of this disturbance in circulatory dynamics

Dr Mosenthal admits that there has been considerable clinical investigation in the treatment of tuberculosis complicated by diabetes, and we agree that his comparisons in 1941 were valid then Since then, however, it has been generally accepted that in acute and febrile diseases preference should be given the quick-acting insulins Since tuberculosis in both acute and chronic forms is an active disease entity, it is my opinion that the same rules should hold to the use of insulins

It is possible that the trend to the use of mixtures of insulins has indirectly been a partial check on the unfavorable effects of protamine zinc insulin. The increasing demand for crystalline zinc insulin is an indication that from the clinical viewpoint the profession is not entirely satisfied with the results of protamine zinc insulin Our observations seem to add light to the abovementioned reasons

Whereas, clinical observations are usually *a posteriori* deductions, their validity is quite often confirmed or rationalized by a search in the literature to explain one's observations For example, Reiner *et al* [*Proc Soc Exper Biol & Med* 50 70 (1942)] report that protamine inhibits tissue respiration. This is a mechanism by which some of the clinically observed, adverse effects of protamine zinc insulin may be explained.

Far-reaching changes of clinical and therapeutic import may develop by observations of one or several cases Dr Mosenthal and others are certainly in the position to aid in clarifying the issue by observation and interpretation.

FEE SCHEDULE FOR HOME TOWN MEDICAL CARE PROGRAM*

To the Editor

It has come to my attention that considerable misunderstanding has developed throughout the medical profession concerning the fees for medical services to be paid private physicians participating in the various home town medical care plans for veterans It has been contended that the Veterans Administration has arbitrarily established a fee schedule of maximum amounts which may be paid for any given service and that this is, in effect, a national fee schedule It has also been claimed that the various state medical societies and other interested groups were not consulted when this fee schedule was adopted.

In order to avoid misunderstanding on this subject, I am authorized to state that the Veterans Administration Chief Medical Director, Dr Paul B Magnuson, neither desires nor intends to establish a national schedule of fees, nor did his predecessor, Dr Paul R. Hawley

The fee schedules originally proposed by the various state medical societies when the Home Town Medical Care Plan was inaugurated varied widely in format, terminology, and fees for similar or identical services It seemed advisable, therefore, to establish a uniform fee schedule format and tentative fees to be used as a guide by state medical societies in submitting proposals for the furnishing of medical care to veterans

The uniform fee schedule format was drawn up by the professional groups of national consultants to the chief medical director These groups, composed of eminent physicians from all parts of the country, represent all the specialties in medicine and surgery Tentative fees were included in the format after a careful analysis of prepaid *medical care plan, and* workman's compensation and insurance fee schedules and also of the fee schedules in effect in the various states having agreements with the Veterans Administration

As was expected, the fees reviewed varied considerably The professional group of national con-

* This letter is published at the request of Dr Bauckus president, Veterans Medical Service Plan —*Editor*

sultants made every effort to arrive at just and reasonable fees for inclusion in the uniform provisional fee schedule This schedule is intended to serve as a guide only and to facilitate and expedite the preparation of agreements between state medical societies and the Veterans Administration.

The schedule contains elastic fees for certain operations and services which evoke more than average contention Maximum and minimum fees considered equitable are listed for these items, and they are marked "AA," indicating that the fee is to be determined by arbitration and agreement between the medical society and the Veterans Administration.

May I repeat that the Veterans Administration fee schedule format is in no sense an arbitrary or national fee schedule Nor is it a fixed schedule, for it is subject to periodic review and modification

With your approval, I would appreciate very much your arranging to publish this as an open letter in the NEW YORK STATE JOURNAL OF MEDICINE I should like this to reach all the physicians in New York State, and I know of no better way to do it than through the JOURNAL.

ETHAN FLAGG BUTLER, M D
Branch Medical Director

Veterans Administration
Branch Office No 2
346 Broadway
New York 13, New York

October 25, 1948

To the Editor

Dr Butler's letter of October 25, relating to fee schedules, is at hand, and I am pleased with the tenor of its content

As you know, the fee schedule which is in effect in New York State is the result of study and agreement between the Veterans Administration and the Veterans Medical Service Plan of New York, Inc It has been changed and is subject to change from time to time, by mutual agreement I regard it as quite satisfactory, and I do not think it has caused much trouble in this past two years of our work For the Plan, we have always been in favor of discussing any fee schedule items that did not seem agreeable to the Veterans Administration

The uniform fee schedule format did not supercede our New York State fee schedule I agree that such a format is necessary for clear consideration of the many items that need to be discussed before contracts are made between state medical societies and the Veterans Administration It is my understanding that after such a study the state medical society, or its representatives, and the Veterans Administration come to an agreement on their own fee schedule for that state

WHAT'S IN A NAME?

To the Editor

In the August issue of the NEW YORK STATE JOURNAL OF MEDICINE I noted your article "There Is a Need" (page 1683)

I have a suggestion to make Why not call the male nurse "Nurser" and the female nurse 'Nurse"

This change might make a bisexual profession out of the now unisexual profession.

JOHANNES BEHRENDT

MARY AND HER LITTLE COLD

Mary had a little cold,
But wouldn't stay at home
And everywhere that Mary went
The cold was sure to roam.
It wandered into Molly's eyes
And filled them full of tears—
It jumped from there to Bobby's nose,
And thence to Jimmie's ears
It painted Anna's throat bright red,
And swelled poor Jennie's head
The moral of this little tale
Is very quickly said—
She could have saved a lot of pain
With just one day in bed —*Distaff July, 1948*

NECROLOGY

Martin Laurence Bodkin, M D, seventy-nine, died on December 1 at his home in Brooklyn Dr Bodkin was graduated from the College of Physicians and Surgeons, Columbia University, in 1894 and started practice in Brooklyn A former chairman of the medical board of St Mary's Hospital, Brooklyn, he had also been consulting proctologist at St Catherine's, Caledonian, Midwood, Zion, Williamsburgh, and Bushwick Hospitals in Brooklyn He was a fellow of the American College of Surgeons and a member of the Brooklyn Surgical Society and the New York State and Kings County Medical Societies

Edward John Davin, M D, of New York City, died December 5 at his home He was fifty-nine Dr Davin received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1912, and served overseas as a captain in the Army Medical Corps during World War I Formerly director of obstetrics and gynecology at Lincoln Hospital, the Bronx, and director of obstetrics at St Clare's Hospital, Manhattan, he was a fellow of the American College of Surgeons, a diplomate of the American Board of Obstetrics and Gynecology, and a member of the American Medical Association and the New York State and County Medical Societies

Annie M Hull, M D, seventy, died at her home in Glens Falls on November 22 She was a graduate of the New York Medical College and Hospital for Women in 1903 and had practiced medicine in Glens Falls for almost fifty years She had also served as health officer for the town of Queensbury Dr Hull was a member of the New York State Board of Medical Examiners and the New York State and Warren County Medical Societies

Arthur Many Johnson, M D, died November 30 at Strong Memorial Hospital, Rochester, at the age of seventy-four He was graduated from Albany Medical College in 1895 and interned at Ellis Hospital, Schenectady, before starting private practice in Rochester in 1897 Dr Johnson was associated with the Health Bureau from 1905 until his retirement in 1945, and served in the Army Medical Corps during World War I

In 1943 he received the Albert David Kaiser medal of the Rochester Academy of Medicine in recognition of his services as a health officer and coordinator of medical activities for the national defense program He was a member of the Rochester Academy of Medicine and the New York State and Monroe County Medical Societies

Harry Judson Lipes, M.D., seventy-seven, died November 25 at the Albany Hospital after a long illness He was graduated from Albany Medical College in 1897 and served in France during World War I with an artillery unit, receiving wounds which prevented him from performing surgical operations although he continued his general practice In 1916 he served with the Second New York Infantry on the Mexican border as a major in the hospital corps He received the Silver Star from General Pershing for gallantry in action

Active in veterans' organizations, Dr Lipes was New York State surgeon general of the Disabled American Veterans A frequent lecturer on obstetrics at Albany Medical College, he was a member of the New York State and Albany County Medical Societies

Louis De Lattre Pulsifer, M D, of Mexico, died suddenly on October 26 from a heart attack He was seventy-six A graduate of Syracuse University Medical School in 1900, Dr Pulsifer interned at Bellevue Hospital, New York City, and practiced for two years in Deruyter before opening his office in Mexico in 1904, where he practiced for forty-four years

Active in the community, Dr Pulsifer had served as mayor of the village, town supervisor, a member of the board of education, school physician, health officer for the village and town of Mexico and the town of Palermo, and medical examiner of the draft board at Pulaski during World War I He was a member of the New York State and Oswego County Medical Societies

George Herbert Ramsey, M.D, fifty-seven, died from tuberculosis at Saranac Lake on November 30 Nationally known in public health circles, he was graduated from the College of Physicians and Surgeons, Columbia University, in 1917, and received the degree of doctor of public health from Johns Hopkins University in 1926 During World War I he served as an Army medical officer with Base Hospital 15 in Chaumont, France

Formerly deputy commissioner in the Michigan Health Department, he taught epidemiology at the University of Michigan and at Johns Hopkins and in 1933 was appointed director of the division of communicable diseases of the New York State Department of Health An advocate of physical examinations as a preliminary to marriage in New York, he had general supervision of the program for the prevention of venereal disease in this State

In 1938 Dr Ramsey was appointed health commissioner of Westchester County During his term there he developed the county's syphilis control program, campaigned for adequate sewage disposal for communities along the Hudson River so that swimming would be safe from danger of typhoid fever, and saw the county make gains in the control of such diseases as tuberculosis, typhoid, and pneumonia He was president of the American Epidemiology Society

Hans Richard Sauer, M.D, forty-five, died on December 1 after a heart attack while performing an operation at the Roswell Park Institute for Malignant Diseases in Buffalo A native of Vienna, he received his medical degree from the University of Berlin in 1928 and came to this country in 1938, becoming a citizen in 1943 He was a diplomate of the American Board of Urology and a member of the Buffalo Academy of Medicine and the New York State and Erie County Medical Societies

Benjamin James Slater, M.D, of Rochester, died on December 4 at the age of sixty Associate medical director of the Eastman Kodak Company of

Rochester, he was nationally known in the field of industrial medicine and was former president of the New York State Society of Industrial Medicine

Dr Slater was graduated from Cornell University Medical College in 1914 and served overseas for the Red Cross during World War I as resident surgeon at a military hospital for France Commissioned in 1918 at the Army Medical School, Washington, D C, in the Army Medical Corps, he served as chief medical examiner of the Engineers Examiners Board before entering private practice in Rochester and becoming associated with Eastman Kodak.

Former president of the Seventh District Branch of the State Medical Society, Dr Slater was a fellow of the American Association of Industrial Physicians and Surgeons and was a member of the New York State and Monroe County Medical Societies

Samuel Aaron Tannenbaum, M.D, seventy-five, died on October 30 at his home in New York City A graduate of the College of Physicians and Surgeons, Columbia University, in 1898, Dr Tannenbaum apportioned his time to the study of medicine and sixteenth and early seventeenth century literature, becoming known as a Shakespearean scholar He was the author of more than 200 articles and 57 books on Elizabethan literature and on psychoanalysis

William J Tierney, M.D, New York City, died on November 23 at the age of eighty-one He received his medical degree from New York University in 1888 and was medical officer of the New York City Fire Department from 1905 until his retirement in 1947

Giovanni Tenca, M D, fifty-three, died on October 16 at Memorial Hospital, New York City Born in Italy, Dr Tenca was a graduate of the College of Medicine and Surgery of the Royal University of Parma in 1920 and came to the United States in 1932 For fourteen years he was a medical examiner for the Equitable Life Assurance Society

Samuel Abbott Volpert, M.D of Lake Placid, died from a heart attack on November 27 at his home He was forty-nine Dr Volpert was graduated from the Syracuse University College of Medicine in 1922 and had practiced in the Lake Placid area. He was a member of the New York State and Essex County Medical Societies

Ernest Milton Watson, M.D, sixty-three, died on December 5 at Buffalo General Hospital from a cerebral hemorrhage A graduate of the Johns Hopkins Medical School in 1913, he served his internship in medicine at Gorgas Memorial Hospital, Canal Zone Dr Watson was professor of urology at the Buffalo University Medical School, attending urologist at Children's Hospital and at Buffalo General Hospital, visiting urologist at Meyer Memorial Hospital, and consulting urologist at Roswell and Marine Hospitals A fellow of the American College of Surgeons, he was a member of the Buffalo Academy of Medicine, the American Urological Association, the Western New York and Ontario Urological Society, and the New York State and Erie County Medical Societies

---

REHABILITATION AND THE GENERAL PRACTITIONER

In an address delivered before the 57th Annual Meeting of the Association of Life Insurance Medical Directors by Howard A. Rusk, M.D professor and chairman, Department of Rehabilitation and Physical Medicine, New York University College of Medicine on "Dynamic Therapeutics in Chronic Disease Pay Dividends," Dr Rusk stated that, in rehabilitation, as in definitive medical care, the general practitioner is an essential and integral member of the therapeutic team

Today, as new and mounting demands are made upon him to restore his patients to maximum economic and social effectiveness, he must turn to the expanding field of rehabilitation and physical medicine for increased technical skills and assistance

However, many of these simple technics he can apply directly in his office, home, and hospital practice to help his physically disabled patients "learn to live and work with what they have left'

HOSPITAL NEWS

Name Medical Staff for Seton Hospital

APPOINTMENT of the medical staff for Seton Hospital, the Bronx, a 500-bed tuberculosis institution taken over by New York City last year, has been announced by Dr Edward M Bernecker, commissioner of hospitals Dr Eli H Rubin has been named director of medicine and chairman of the medical staff Other directors of service are Dr Alexander E W Ada, surgery, Dr Forris E Chick, pediatrics, Dr Goodlatte B Gilmore, otolaryngology, Dr Nathan Savitsky, neuropsychiatry, Dr John Duff, urology, and Dr Joseph Hory, ophthalmology Consultants for the medical staff of Seton Hospital include Dr J Burns Amberson, medicine, Dr Louis H Barenberg, pediatrics, Dr Edward R Cunniffe, surgery, Dr Joseph Golomb, pediatrics, Dr Milton J Goodfriend, gynecology, Dr H C Maier, thoracic surgery, Dr Nathan B Van Etten, medicine, Dr H M Zimmerman, pathology, Dr Frank Berry, thoracic surgery, and Dr Murray L Brandt, gynecology

State to Get Seven New Hospitals in V A Program

NEW YORK STATE will share in the Veterans Administration's $1,000,000,000 ninety-one-hospital building program to the extent of $122,000,000 and seven new hospitals

The hospitals, four of which are already under construction, will house more than 8,000 long-term patients and will be capable of handling more than three times that number on a short-term or daily basis Most of the hospitals will be general medical and surgical institutions, but one, the Franklin Delano Roosevelt Veterans Hospital near Peekskill, will specialize in neuropsychiatric treatment.

The six other hospitals will be at Albany, Syracuse, Buffalo, Fort Hamilton in Brooklyn, First Avenue and East Twenty-fifth Street in Manhattan, and at a site in New York City not yet chosen The new hospitals will bring the total number of V A hospitals in the State to 17

Colonel W W Wanamaker, district engineer, revealed that the last piece of outside brick has been put in place on th 1,000-bed Fort Hamilton Hospital Work is progressing according to schedule, he said, and if all goes well, patients will begin to be admitted by November, 1949

The Franklin Delano Roosevelt Hospital, which overlooks the Hudson River, is 54 per cent complete and will be ready for occupancy in the fall of 1949 It consists of 31 buildings and will have a bed capacity of 1,984 Excavation has been completed and foundations have been poured for all the buildings Brick work has been started on 19 buildings and roofs have been installed on 10

All seven hospitals will be completed by 1953, but personnel recruitment will not start until the summer of 1949 All the nonprofessional positions will be filled through civil service channels

Set Home Care Experiment for Rheumatic Fever Patients

AN EXPERIMENT in the care of rheumatic fever patients, which, it is hoped, will enable the patient to live at home under adequate medical supervision, has been set up at the Montefiore Hospital, the Bronx, according to an announcement made by Dr Robert L Levy, president of the New York Heart Association The experiment is made possible by a grant of $52,600, covering the period through December 31, 1949, which was voted by the Association as a result of a survey made by the organization's committee on institutional care, under the chairmanship of Dr Alfred Langmann

The project is described as a pilot study on home care for "medically indigent" children with rheumatic fever, the purpose of which is to find an economically feasible means of providing continuous medical care for patients who have been released from hospital treatment. Services are made available free of charge to families which otherwise could not afford the care

Explain Hospital Deficits

A GENERAL hospital maintaining an outpatient department can trace one third of its operating deficit to that department, according to the *Bulletin* of the Hospital Council of Greater New York, published recently

"Although there has been a reduction in the amount of outpatient service in recent years," it is said, "the expense of operating the outpatient department increased well over 100 per cent between 1937 and 1947"

Outpatient department expenses of the 49 voluntary general hospitals belonging to the United Hospital Fund increased from $3,590,000 to $7,590,000, while the total income in 1947 was $3,160,000

Lay Cornerstone for Additional Cancer Hospital

CORNERSTONE ceremonies for the ten-story, 300-bed James Ewing Hospital for Cancer, New York City, which will be affiliated with the Memorial Cancer Center, were held November 26, 1948, with Mayor William O'Dwyer as principal speaker Dr Edward M Bernecker, city commissioner of hospitals, presided

Expected to be completed late this year, the hospital is being constructed of rigid steel frame and reinforced concrete with the exterior of red brick to match Memorial Hospital and the Sloan-Kettering Institute for Cancer Research, thus bringing into architectural harmony the entire Memorial Cancer Center group

NEWS NOTES

Dr Edward M Bernecker, New York City commissioner of hospitals since March, 1942, retired from the post at the end of December In his notice of retirement, he summarized his department achievements, and predicted that "significant developments" in the city hospitals since 1945 will have "far-reaching effects not only in this city but throughout the country"

"Application of Physics to Clinical Medicine" was the topic of a clinical conference held December 20, 1948, by the Mount Sinai Hospital, New York City Speakers and their topics were Dr S B Yohalem, "Graves' Disease Treated with Radioactive Iodine", Dr S Megibow, "Patent Ductus Arteriosus Diagnosed by Microplethysmography", Dr N Simon, "Carcinoma of Thyroid Gland Treated with Radioactive Iodine", Dr P Kaunitz, "Urinary Calculus Identified by X-ray Diffraction," and Dr S Estron, "A Case of Polycythemia Vera Treated with Radioactive Phosphorus"

Dr Philip T Cortese, Amsterdam, has been appointed as full-time hospital physician at the Amsterdam plant of the Bigelow-Sanford Carpet Company, succeeding Dr Edward A Bogden, who has returned to private practice

Dr Stuart Winning, Brooklyn, has assumed the position of chief surgeon at the A Barton Hepburn Hospital, Ogdensburg, following his appointment by the board of directors.

Dr George F Bock was elected president of the medical staff of the Mercy Hospital, Watertown, at the annual election held November 30, 1948 He succeeds Dr Sutherland E Simpson Other officers are Dr Thomas N Sickles, vice-president, and Dr Charles F Goodnough, secretary

Dr Richard Nauen, Delmar, hospital medical adviser in the State Division of Tuberculosis Control, has been appointed acting director of the J N Adam Memorial Hospital at Perrysburg

---

ROCHESTER BLUE SHIELD PLAN EXPANDS MEMBERSHIP

Individual subscribers to Blue Cross in Rochester are now being given an opportunity to become members of Blue Shield, according to a recent announcement by Dr Maurice A. Barnard, president of Blue Shield

Originally enrolled through a group, many Blue Cross subscribers transfer to an individual contract and pay their dues directly to the Plan upon termination of their employment where the group was formed Such nongroup members frequently total more than one fourth of the enrollment in the average Blue Cross Plan Wherever Blue Cross membership is required before a person may subscribe to the affiliated Blue Shield Plan, these direct payment members have not been eligible due to group enrollment requirements.

Blue Shield in Rochester is one of the first Plans to offer membership to Blue Cross nongroup subscribers An earlier experiment of this type was made in Kansas City a year ago, and repeated again last summer, with nearly 40 per cent of the eligibles signing up for Blue Shield

MEDICAL NEWS

Medical Academy Gets Ancient Manuscript

THE Edwin Smith Papyrus, termed "the oldest scientific book in America and the oldest nucleus of really scientific knowledge in the world," was presented to the New York Academy of Medicine by the New York Historical Society and the Brooklyn Museum at ceremonies held December 2, 1948

Dr Fenwick Beekman, president of the Historical Society, made the address of presentation The Papyrus is estimated to be 3,600 years old and contains the most important body of medical knowledge which has survived from the ancients Divided into three parts, it deals with surgery in a series of 48 illustrative cases, each presented methodically, beginning with the name of the ailment, the examination, a diagnosis and finally the "verdict" In the text the word "brain" occurs for the first time in writing

The papyrus, which was translated in the 1920's by the late Dr James Henry Breasted, was purchased in Luxor in 1862 by the late Edwin Smith, Egyptologist, and presented by his daughter to the Historical Society

Survey of Medical Education

THE Council on Medical Education and Hospitals of the American Medical Association and the Association of American Medical Colleges will sponsor a joint survey of medical education, beginning January 1 New York members of the committee of seven appointed to conduct the survey and publish a report of its finding include Dr Alan Valentine, president, University of Rochester, chairman, Dr Herman G Weiskotten, dean of the Syracuse University College of Medicine, and Dr Joseph C Hinsey, dean of the Cornell University Medical College

The committee has appointed Dr John E Deitrick, New York City, to be the full-time director of the survey He is associate professor of medicine at the Cornell University Medical College and medical director of postgraduate instruction of the Second (Cornell) Medical Division, Bellevue Hospital, New York City

Objectives of the study are to evaluate the present programs and determine the future responsibilities of medical education in its broadest aspects for the purpose of

1 Improving medical education to better meet the over-all needs of the American people for the prevention of disease, the restoration as far as possible to health of all those who have suffered ill health or injury, and for the maintenance of the best standards of the physical and mental health of all the people

2 Assessing the degree to which medical schools are meeting the needs of the country for physicians

3 Promoting the advancement of knowledge in the field of medical science

4 Better informing the public concerning the nature, content, and purposes of medical education

American Board of Obstetrics and Gynecology

THE next written examination and review of case histories (Part I) for all candidates will be held in various cities of the United States and Canada on Friday, February 4, 1949

Arrangements will be made so far as is possible for candidates to take the Part I examination (written paper and submission of case records) at places convenient for them Candidates who successfully complete the Part I examination proceed automatically to the Part II examination to be held May 8 to 14 inclusive, 1949, at the Hotel Shoreland, Chicago, Illinois Notice of the exact time and place of the Part I and Part II examinations will be sent all candidates well in advance of the examination date

New bulletins are now available for distribution upon application and give details of all changes in Board requirements and regulations made at the annual meeting of the Board held May 16 to May 22, 1948 These relate both to candidates and to hospitals conducting residency services for training

Application forms and bulletins are sent upon request made to the American Board of Obstetrics and Gynecology, 1015 Highland Building, Pittsburgh 6, Pennsylvania

Dedicate Rehabilitation Center at Buffalo

THE Western New York Civic Committee for Education on Alcoholism, comprised of more than 80 interested community leaders, secured funds to establish a Rehabilitation and Information Center in the University of Buffalo Medical School, which was formally dedicated on December 2 A grant of Federal money was made through the New York State Department of Mental Hygiene and will be administered on the State level by the State Department of Health and on the local level by the Medical School with the cooperation of the Committee and the Medical Society of the County of Erie

Speakers at the ceremony were Dr Stockton Kimball, dean of the School of Medicine, Dr E Dean Babbage, president of the Erie County Society, and Dr Kenneth Goldstein, of the Rehabilitation Center

Cornell Offers Graduate Instruction in Internal Medicine

CORNELL University Medical College is now offering graduate instruction in internal medicine and neurology. The teaching facilities of the Second (Cornell) Medical Division, Bellevue Hospital, New York City, comprising one hundred and forty-five beds, are devoted exclusively to this work. The instructors are members of the faculty of Cornell University Medical College.

The course is designed to give practical instruction in the subjects of internal medicine, neurology, and pathological physiology. The work consists of daily bedside study of patients on the medical and neurologic wards. Each physician is assigned a series of patients and cooperates with the resident and attending staff in their care. A limited number of men may obtain special training in cardiology, hematology, diabetes, endocrinology, and gastrointestinal diseases in the special clinics of the outpatient department. All students receive practical instruction in electrocardiography.

The teaching program is a continuous one and physicians are admitted on the first of each month as vacancies occur. For any one individual, the course is of either three months or six months duration. The three months course may include six weeks of neurology and six weeks of medicine or may be limited entirely to medicine. The maximum number of physicians registered in the course at any one time will be limited to 25.

An examination is offered by the Department of Medicine, Cornell University Medical College, at the end of the course. Successful completion of this examination and satisfactory ratings by individual tutors will be required of those who desire credit in partial fulfillment of the requirements of the American Board of Internal Medicine.

Inquiries and applications should be addressed to Dr. John E. Deitrick, Director, Second (Cornell) Medical Division, Bellevue Hospital, First Avenue and Twenty-sixth Street, New York 16, New York.

Doctors Serving New York 50 Years Honored

MORE than 30 doctors, each of whom has practiced in or about New York City for fifty years or more, were honored December 7 at the New York University-Bellevue Medical Center during ceremonies commemorating the merging in 1898 of the formed Bellevue Hospital Medical College into New York University College of Medicine.

Highlight of the speaking program and reception, which marked the event, was a tribute paid by Dean Currier McEwen, speaking on behalf of the Medical Center to veteran doctors graduated in 1898 or before. Thirty-two of the cited doctors were present and received the tribute in person. Also present were doctors who were undergraduates of the College in the years immediately following the merger, together with leaders of the Medical Center and officials of the Department of Hospitals of New York.

Among the doctors honored were Dr. Nathan B. Van Etten, past president of the American Medical Association, Dr. Samuel A. Brown, acting chairman of the board of trustees, New York University-Bellevue Medical Center, Dr. William Logie Russell, professor emeritus of psychiatry, Cornell University Medical College, Dr. Thomas A. Gonzales, medical examiner of New York City, and Dr. John F. Erdmann and Dr. John J. Moorhead, New York surgeons.

Among other distinguished alumni present were Dr. Homer Swift, formerly director of the Rheumatic Fever Service, Rockefeller Institute for Medical Research and during World War II acting director of the Rockefeller Hospital, Dr. John M. Hanford, now a member of the Columbia University medical faculty, and such noted New York physicians as Dr. Hervey C. Williamson, Dr. Luther B. MacKenzie, and Dr. Claude Heaton, New York medical historian.

The old University Medical College was founded in 1841 and the Bellevue Hospital Medical College in 1861 on the grounds of Bellevue Hospital. After the merger in 1898, the College of Medicine was known as the University and Bellevue Hospital Medical College until 1935, when the present name was officially adopted.

Postgraduate Fellowships Announced

POSTGRADUATE fellowships in the fields of research, physical medicine and public health are now available through the National Foundation for Infantile Paralysis. Application may be made to the Foundation at 120 Broadway, New York 5, New York, at any time during the year. Selection of candidates will be made on a competitive basis by committees composed of specialists in each field. Awards are based on the individual need of each applicant.

Research fellowships are available in virology, orthopedic surgery, pediatrics, epidemiology, and neurology. These fellowships are intended to emphasize advanced training in the basic sciences as they apply to the particular specialty and to research and experience in research, which need not be immediately related to poliomyelitis.

In physical medicine, clinical fellowships are available for physicians who wish to prepare for eligibility for certification by the American Board of Physical Medicine. Public health fellowships are available to physicians for one year of postgraduate study leading to a Master of Public Health degree at a school of public health approved by the American Public Health Association. Further information may be obtained from the Foundation.

MEETINGS

PAST

Middle Atlantic States Regional Conference

The Middle Atlantic States Regional Conference was held on November 18, 1948, in Philadelphia, with the Philadelphia County Medical Society acting as host Topic of the morning session was, "What Is the Responsibility of the Practitioner in Relation to Hospital Financing?" and of the afternoon session, "Blue Cross-Blue Shield—Commission Proposals"

New York participants included Dr Thomas A McGoldrick, Brooklyn, a member of the A M A Council on Medical Service, who served as moderator of the afternoon session

Saranac Lake Medical Society

At a meeting of the Saranac Lake Medical Society on November 24, Dr Elliott Michelson spoke on "Thoracoplasty at Trudeau" and Drs G W Wright and R. S Mitchell discussed "Pneumoperitoneum"

At the December 1 meeting, Dr William W Beckman, assistant dean of the New York University College of Medicine, spoke on "Medical Aspects of Social Service"

Brooklyn Dermatological Society

At the meeting of the Brooklyn Dermatological Society in December, the following officers were elected Dr E A Gauvain, president, Dr I N Holtzman, vice-president, Dr S I Greenberg, secretary-treasurer, and Dr S H Silvers, editorial secretary Meetings are held on the third Monday of each month, at the Brooklyn Hospital Dispensary

FUTURE

Women's Medical Society of New York State

The semiannual meeting of the Women's Medical Society of New York State will be held January 29 and 30 in New York City Further details will be announced Dr Adelaide Romaine, New York City, will preside

Association of Military Surgeons of the United States, Metropolitan New York Chapter

A joint meeting of the Metropolitan New York Chapter of the Association of Military Surgeons of the United States and the New York Academy of Medicine will be held Monday evening, January 31, at 8 30 P M , at the Academy

Dr George Baehr, president of the Metropolitan Chapter, will be chairman of the meeting The program will include the following speakers and topics Major General R W Bliss, surgeon general, U S Army, "Military Responsibility for Civilian Health in War", Admiral Ross T McIntire, administrator of the National blood program, American Red Cross, "American Red Cross National Blood Program", Dr Edwin J Cohn, professor of biologic chemistry, Harvard Medical School, "Fractionation of Blood", Dr Louis K Diamond, department of pediatrics, Harvard Medical School, "The Rh Factor," and Colonel Elbert DeCoursey, U S Army, "Effects of Atomic Radiations on Blood forming Elements"

PERSONALITIES

Honored

Dr Maurice J Lewi, president and founder of Long Island University's College of Podiatry, by a group of 100 friends and relatives in celebration of his ninety-first birthday Dr George N Papanicolaou, New York City, professor of clinical anatomy at Cornell University Medical College, who received the Borden Prize for the outstanding contribution by a faculty member of an American medical college in the field of medical science Dr Mary Ross, Binghamton, named Broome County's outstanding general practitioner by the Broome County Medical Society Dr Howard A Rusk, New York City, chairman of the department of rehabilitation and physical medicine at New York University College of Medicine, who received the annual meritorious award of the National Rehabilitation Association for outstanding service in the field of rehabilitation

Appointed

Dr George B Jerzy Glass, New York City, as assistant clinical professor of medicine at the New York Medical College, Flower and Fifth Avenue Hospitals

Elected

Dr Arthur M Dickinson, Albany, as vice-president of the Association of Surgeons of the New York Central System Dr George H Marcy, Buffalo, as president of the same group Dr Horace S Baldwin, New York City, treasurer of the American Academy of Allergy

Retired

Dr Joe Rainey Clemmons, executive vice-president and medical director of Roosevelt Hospital, New York City, for the past eleven years, on January 1

Speakers

Dr Maurice Meltzer, New York City, on "Present Day Treatment of Prostatism, Benign and Malignant" at a meeting of the North Hudson Physicians Society, North Hudson Hospital, Weehawken, New Jersey, on November 22 Dr George T Pack, New York City, on November 17 at a cancer conference for Rhode Island physicians held under the auspices of the Rhode Island Medical Society at Providence, and on December 1 at a cancer seminar at the University of Maryland, Baltimore, on "Can-

cer of the Stomach" Dr George M Wheatley, New York, chairman of the rheumatic fever committee of the American Academy of Pediatrics, on November 21 at the academy's annual meeting in Atlantic City, New Jersey

New Offices

Dr A. S Catinella, former Batavia health officer, general practice in New York City Dr Richard J Clifford, Navy veteran, general practice in Amsterdam

Dr Robert D Hubbard, a veteran of five years service with the Army Medical Corps in the South Pacific, practice of dermatology and syphilology with the Slocum-Dickson Clinic, Utica

COUNTY NEWS

Albany County

The annual election of officers of the Albany County Medical Society was held at the December 15 meeting The slate presented by the nominating committee included Dr Edward S Goodwin, president, Dr Thomas J O'Donnell, vice-president, Dr Albert Vander Veer, secretary, Dr Frances E Vosburgh, treasurer, and Dr Emerson C Kelly, historian

Speakers at recent meetings have included at the November 24 meeting, Dr L C D Bingham, professor of surgery, Queens University, Kingston, Ontario, on "Early Diagnosis and Treatment of Carcinoma of the Colon," and at the October 27 meeting Dr J S L Browne, professor of medicine, McGill University, Montreal, Quebec, on "The Alarm Reaction and the Diseases of Adaptation"

The annual dinner dance of the society was held on December 9 at the Colonie County Club, Albany

Allegany County

Dr Henry C Shaw, associate professor of medicine at the University of Rochester School of Medicine and Dentistry, spoke on "Common Diseases of the Skin" at the meeting of the Allegany County Medical Society held November 11 in Belmont The lecture was postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Society with the cooperation of the State Department of Health

Bronx County

Dr Louis J Soffer spoke on "The Role of the Adrenals in Health and Hypofunction and Hyperfunction of the Adrenals" at the November 17 meeting of the Bronx County Medical Society

At the October 20 meeting, Dr Renato J Azzari, president of the county society, gave his inaugural address, Dr Leo F Simpson, president of the State Society, spoke on "Your State Medical Society," and Dr David J Kalisk, director of the State Society's Workmen's Compensation Bureau, spoke on "The New York State Compensation Law"

Broome County

Progress of the rheumatic fever program inaugurated last spring was reviewed by Dr William Aten, chairman of the program, at the meeting of the Broome County Medical Society October 12 in Binghamton Dr William H. Hobbs, Binghamton, discussed cancer of the breast.

Chenango County

"The Painful Back" was the topic of a lecture by Dr Roscoe D Severance, clinical professor of orthopedic surgery, Syracuse University College of Medicine, at the meeting of the Chenango County Medical Society December 14 in Norwich The program was postgraduate instruction arranged by the Council Committee on Public Health and Education with the State Department of Health

Clinton County

New officers were elected at the meeting of the Clinton County Medical Society held November 16 They are Dr Aaron Davis Mooers, president Dr Leonard J Schiff, Plattsburg vice-president, and Dr Kenneth M Clough, Plattsburg, secretary-treasurer

At the October 28 meeting, postgraduate instruction was given by Dr Leon G Berman, clinical associate professor of surgery, Syracuse University College of Medicine, on "The Diagnosis and Treatment of the Acute Abdomen"

Cortland County

Dr William Woodin, instructor in medicine at the Syracuse University College of Medicine, spoke on "The Antihistaminic Drugs in Therapy of Allergic Diseases" at the meeting of the Cortland County Medical Society on November 19 in Cortland The instruction was arranged by the State Society's Council Committee on Public Health and Education with the cooperation of the State Department of Health

Dutchess County

On December 8, a dinner meeting of the Dutchess County Medical Society and its Auxiliary was held in Poughkeepsie, with Dr Joseph S Lawrence, director of the Washington office of the Council on Medical Service of the A M A, as guest speaker His topic was "Medical Legislation"

Dr John E Heslin, professor of urology at Albany Medical College, spoke on "Conservation of Renal Function" at the November 10 meeting held at the Hudson River State Hospital, Poughkeepsie. At the October 16 meeting, held at the Veterans' Hospital, Castle Point, Dr Konrad Birkhaug, from the State Department of Health, spoke on "BCG Vaccination Against Tuberculosis"

Essex County

At the annual meeting of the Essex County Medical Society, held October 7, the following officers were elected Dr T J Cummins, president, Dr Wilbur S Rose, vice-president, and Dr James E Glavin, secretary-treasurer

Fulton County

Dr Locke L Mackenzie assistant professor of obstetrics and gynecology at the New York University Post-Graduate Medical School, spoke on

"The Use of Cell Smears in the Early Diagnosis of Cancer" at the meeting of the Fulton County Medical Society held November 17 in Johnstown The program was arranged by the Council Committee on Public Health and Education of the State Society with the cooperation of the State Department of Health

Greene County

Dr Michael Viviano of Tannersville was elected president of the Greene County Medical Society at the annual meeting held October 12 in Catskill Other officers elected were Dr M K Colle, vice-president, Dr William M Rapp, secretary, and Dr Mahlon H Atkinson, treasurer, all of Catskill

Jefferson County

"Practical Problems in Management of Diabetes" was discussed by Dr William S Collens, of Brooklyn, chief of the diabetic and peripheral vascular disease clinic of Israel Zion Hospital, at the meeting of the Jefferson County Medical Society held December 9 in Watertown

At the November 11 meeting, Dr Harry A Steckel, professor emeritus of psychology at the Syracuse University College of Medicine, spoke on "Psychosomatic Medicine"

Dr Leonard M Vincent of Brownville was elected president of the Jefferson County Society at the annual meeting

Kings County

Speakers at the November 16 meeting of the Kings County Medical Society included Miss Marie Knowles, executive director of the Visiting Nurse Association of Brooklyn, who explained the activities of the group, Dr George E Anderson, secretary of the American Diabetes Association, on "Diabetes Detection Drive," and Louis Bromfield, Ohio, on "Health Through the Soil"

At the October 19 meeting the program was sponsored by the Brooklyn Cancer Committee, and included "Cytogenic Aspects of the Cancer Problem," Dr Vernon Bryson, Cold Spring Harbor, "Carcinoma of the Breast," Dr Cushman D Haagensen, New York, "Cancer of the Colon and Rectum," Dr Frank H Lahey, Boston, Massachusetts, and "Teamwork in Cancer Diagnosis," Dr Brewster S Miller, American Cancer Society

Lewis County

Dr Harry A Steckel, professor emeritus of psychiatry at the Syracuse University College of Medicine, spoke on "Alcoholism as a Medical Problem" at the meeting of the Lewis County Medical Society held November 4 in Lowville The postgraduate instruction was arranged by the State Society's Council Committee on Public Health and Education with the cooperation of the State Department of Health

Livingston County

Dr Ward Ekas of Rochester spoke on "Office Gynecology" at the meeting of the Livingston County Medical Society held October 27 at the Avon Inn

Monroe County

A one-day program of postgraduate instruction was presented for the Monroe County Medical Society on November 11 at the Rochester Academy of Medicine Arrangements were made by the State Society's Council Committee on Public Health and Education with the cooperation of the State Department of Health

Speakers and their topics were Dr Paul A Bunn, associate professor of medicine, Syracuse University College of Medicine, "Recent Advances in Chemotherapy of Bacterial Infections", Dr William T Foley, instructor in medicine, Cornell University Medical College, "The Use of Dicumarol in Cardiovascular Diseases", Dr Edward F Hartung, assistant clinical professor of medicine and chief of the division of arthritis, New York Post-Graduate Medical School and Hospital, "Diagnosis and Treatment of Back Pain from the General Practitioner's Point of View", Dr A H Aaron, clinical professor of medicine, University of Buffalo School of Medicine, "The Periodic Health Examination with Special Reference to Cancer Control," and Dr Leon H Griggs, clinical professor of medicine, Syracuse University College of Medicine. "Common Diseases of the Skin"

Nassau County

A series of postgraduate instruction lectures have been arranged for the Nassau County Medical Society by the Council Committee on Public Health and Education of the State Society, with the cooperation of the State Department of Health, and are being held Thursday afternoons, at 4:00 P M , at the Nassau Hospital auditorium, Mineola.

Future programs include

January 27—"Newer Concepts and Therapy of Hypertension"—Dr Richard S Gubner, assistant medical director, Equitable Life Assurance Society, New York

February 3—"Common Parasitic Infections Encountered in General Practice"—Dr Arthur W Grace, professor of clinical dermatology and syphilology, Long Island College of Medicine

February 10—"The Management of the Failing Heart"—Dr Nathaniel T Kwit, associate cardiologist, Beth Israel Hospital and Hospital for Joint Diseases

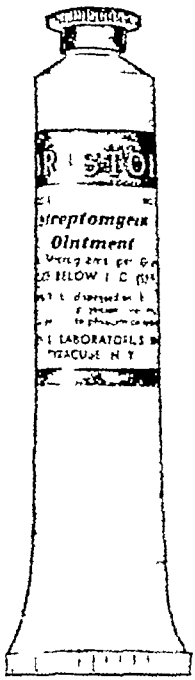
Feburary 17—"What Can the General Practitioner Do About Lowering Cancer Mortality?"—Dr Lloyd F Craver, associate professor of clinical medicine, Cornell University Medical College

At a joint meeting of the Nassau County Medical Society and its Woman's Auxiliary, held November 30 at the Garden City Hotel, the speaker was Mr John Hennessy, chairman of the board, Hotel Statler, who discussed "Future in Foods" and gave a radar demonstration

Niagara County

Dr Murray S Howland, department of medicine, Buffalo General Hospital, spoke on "Evaluation of Recent Advances in Ulcer Therapy" at the meeting of the Niagara County Medical Society, held November 9 in Lockport.

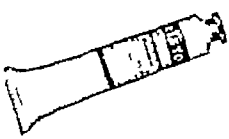
At the October 12 meeting, held in Lewiston, Dr F J Clifford of Niagara Falls spoke on "Immediate Treatment of Facial Wounds"



Onondaga County

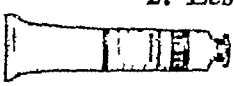
"An American Looks at the World Today" was discussed by Professor Donald G Bishop of Syracuse University at the annual meeting of the Onondaga County Medical Society held December 7 in Syracuse

The annual election of officers was held, with the following slate presented by the nominating committee Dr L W Ehegartner, president, Dr C F



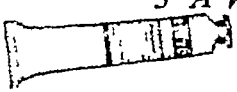
[Continued on page 94]

Streptomycin *is now available in* Ointment *form*



Here is another original contribution to the antibiotic armamentarium from Bristol Laboratories streptomycin sulfate for topical application, in a smooth, greaseless, ointment base This significant development of Bristol research is noteworthy for the following

1. A Broad Antibacterial Spectrum



The variety of bacteria destroyed or inhibited by streptomycin is remarkably broad Its antibacterial spectrum surpasses those of other antibiotics in current use for topical application

2. Less Sensitizing

Streptomycin in ointment form minimizes the greatest single objection to topical antibiotic therapy in that it is demonstrably less sensitizing

3 A Water-Soluble Ointment Base

Bristol Streptomycin Ointment is unusually pleasant to use because it is incorporated in a smooth water soluble base Despite the fact that there is no grease or oil, adequate potency can be expected to persist throughout the full dating period of nine months after manufacture

Bristol STREPTOMYCIN OINTMENT is indicated in skin and wound infections due to streptomycin-sensitive organisms Each gram of the ointment contains 5000 micrograms of pure streptomycin.

Available NOW from your usual source of supply in 1 oz tubes singly, or packed 12 to a carton

Bristol
LABORATORIES INC
SYRACUSE, NEW YORK

[Continued from page 92]

Potter, vice-president, Dr I L Ershler, secretary, and Dr A. C Hofmann, treasurer

Ontario County

Dr Robert Doran was elected president of the Ontario County Medical Society at the annual meeting held October 12 in Canandaigua Other officers chosen are Dr C C Williamson, president-elect, Dr Carl B Smith, secretary-treasurer

Orange County

Programs of postgraduate instruction, arranged for the Orange County Medical Society by the Council Committee on Public Health and Education of the State Society and the State Department of Health, were held November 9 and November 23 in Goshen

Speakers were Dr H S Weichsel, compensation medical examiner, New York Workmen's Compensation Board, "Trauma and Peripheral Vascular Disease," and Dr A H Aaron, clinical professor of medicine, University of Buffalo School of Medicine, "The Evaluation of the Common Drugs in General Practice"

Oswego County

Dr L Maxwell Lockie, head of the department of therapeutics at the University of Buffalo School of Medicine, spoke on "Management of Arthritis—Acute and Chronic" at the meeting of the Oswego County Medical Society held November 16 in Fulton The program was postgraduate instruction arranged by the State Society's Council Committee on Public Health and Education with the cooperation of the State Department of Health

Queens County

A series of Friday afternoon meetings, arranged by the Queens County Medical Society's committee on graduate education, have been held, with the following speakers and topics November 5—Dr Jacob Werne, assistant medical examiner, New York City, "Unexpected Findings in Unexpected Deaths", November 12—Dr Henry K Taylor, Goldwater Memorial Hospital, "Angiocardiography", December 3—Dr Linn J Boyd, director of medicine, New York Medical College, "Pulmonary Embolism", December 10—Dr Harry Erhlich, director of the tumor clinic, Mount Sinai Hospital, "Tumors of the Head and Neck," and November 19—Dr George Schaefer, clinical instructor, obstetrics and gynecology, New York Medical College, "Tuberculosis and Pregnancy"

Richmond County

A symposium on "Heart Disease and Pregnancy" was conducted by Dr Edward P Maynard, Jr, professor of clinical medicine at the Long Island College of Medicine, and Dr J Thornton Wallace, clinical professor of obstetrics and gynecology at the Long Island College of Medicine, at the meeting of the Richmond County Medical Society held December 8

Seneca County

At the annual meeting of the Seneca County Medical Society, held October 27 at Willard, the following officers were elected Dr Emil J Bove, Seneca Falls, president, Dr Kenneth Keill, Willard State Hospital, vice-president, and Dr Bruno Riemer, Romulus, secretary-treasurer

At the meeting Dr Guy Walters, supervising psychiatrist of Willard State Hospital, spoke on "The Plan for the Care of Elderly Mental Patients," and Dr Stanley Lincoln and Dr Frederick Beck of Biggs Memorial Hospital, Ithaca, spoke on "Differential Diagnosis of Diseases of the Chest"

Steuben County

Dr C E Patti of Hornell was elected president of the Steuben County Medical Society at the annual dinner meeting held November 4 in Steuben Other officers chosen are Dr Maynard Guernsey, Corning, vice-president, and Dr R. J Shafer, Corning, secretary-treasurer

At the scientific session Dr Milton G Bohrod, pathologist and director of laboratories at Rochester General Hospital, spoke on "The Clinical Importance of Pathology"

Tioga County

Dr Ellery G Allen, clinical professor of medicine, Syracuse University College of Medicine, spoke on "General Résumé of Hematologic Disorders, Including the Anemias" at the meeting of the Tioga County Medical Society held December 7 in Candor The postgraduate instruction was arranged by the Council Committee on Public Health and Education of the State Society, with the cooperation of the State Department of Health

Warren County

At the meeting of the Glens Falls Academy of Medicine, held November 18 in Glens Falls, Dr Linn J Boyd, professor of medicine at New York Medical College, Flower and Fifth Avenue Hospitals, spoke on "Pulmonary Embolism" as a postgraduate instruction program arranged by the Council Committee on Public Health and Education with the cooperation of the State Department of Health

Washington County

New officers for the Washington County Medical Society were elected at the annual meeting held October 12 in Hudson Falls They are Dr John A Sumner, Granville, president, Dr Joseph Feingold, Fort Edward, vice-president, Dr Denver M Vickers, Cambridge, secretary, and Dr Charles H Prescott, Hudson Falls, treasurer

At the scientific session, Dr R. Leith Skinner, retiring president, gave his presidential address on "Experiences in Treatment of Hypertension," and Dr John G Hayes, Albany, spoke on "The Management of Some Common Obstetric Difficulties"

Wayne County

Dr Harry A. Steckel of Syracuse spoke on "The Psychiatric Approach in General Practice" at the meeting of the Wayne County Medical Society held October 12 in Lyons

Westchester County

"Unexplained Death" was the subject of a lecture given by Dr Alan R. Moritz, professor of legal medicine at Harvard University, at a meeting of the Westchester County Medical Society held November 16 in White Plains

The Importance of Protein Adequacy In Diabetes Mellitus

It appears in the light of recent experience that the daily protein requirement of the diabetic has been underestimated and calls for an upward revision

The success obtained in diabetic retinopathy from the use of high protein diets emphasizes the deleterious possibilities of hypoalbuminemia in this metabolic disease

In view of the excellent results observed from a high protein intake, in many forms of hepatic disease, a dietary rich in protein is suggested as a therapeutic measure in the management of liver enlargement, one of the frequent complications of diabetes [1] Since impaired liver function reduces the efficacy of insulin, prevention of liver enlargement by a liberal allowance of protein in the daily diet of the diabetic appears an important factor in the control of this disease With an estimated 2,000,000 diabetics in the United States[2] every benefit achieved in this field makes itself felt on a truly large scale

Meat is an outstanding source of protein in the dietary of the patient with diabetes mellitus for these reasons It is notably rich in protein, from 17 to 20 per cent of its uncooked, and from 25 to 30 per cent of its cooked weight. The protein of meat, regardless of cut or kind, whether fresh, cured, or canned, is biologically complete All meat is of excellent digestibility—from 96 to 98 per cent Furthermore, meat ranks with the best sources of B vitamins, potassium and phosphorus, all of which are essential factors in the metabolism of carbohydrate

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue Brooklyn N Y Acknowledgment of receipt will be made in these columns and deemed sufficient notification Selection for review will be based on merit and interest to our readers

REVIEWED

Symptoms and Signs in Clinical Medicine An Introduction to Medical Diagnosis By E Noble Chamberlain, M D Fourth edition Octavo of 463 pages, illustrated Baltimore, Williams & Wilkins Co , 1947 Cloth, $8 00

The jaded clinician will find in this book many sources of new enthusiasm in his never-ending study of the sick This easily read volume will disclose to the bewildered bedside medical student that synthesis of the countless facts studied in the preclinic years really is possible

Systematic appraisal of facts and the laboratory and radiographic aids that bear on the clinical problems are thoroughly elucidated The section on the nervous system is intellectually inviting and beautifully simple

MAURICE TULIN

History of Medicine A Correlative Text, Arranged According to Subjects By Cecilia C Mettler, Ph D Edited by Fred A Mettler, M D Octavo of 1,215 pages, illustrated Philadelphia, Blakiston Co , 1947 Cloth $8 50

Let no one believe this to be "just another" history of medicine It is indeed a monumental work which occupied the last nine years of a brilliant mind Sad indeed that with the completion of this book the author's career came to a sudden and sad end

In this work you will find a review of the various stages in the progress of medicine, as far back as the anatomic observations by Galen and on through the Middle Ages and up to the present era of specialization Here you will meet with the immortals like Röentgen, Einthoven, Virchow, Pasteur, Koch, etc The specialties are treated individually, pointing out the various steps toward progress References are listed in profusion throughout the book All in all, it is a book worth owning and reading

HARRY APFEL

Progress in Clinical Medicine By Various Authors Edited by Raymond Daley, M D , and Henry G Miller, M D Octavo of 356 pages, illustrated New York, Grune & Stratton, 1948 Cloth, $6 00

This book attempts to present advances in internal medicine while limiting itself largely to those of proved clinical value The emphasis is on practicability and offers an excellent opportunity to familiarize oneself with current trends

ADOLPH P RAAB

Physician's Handbook. By John Warkentin, M D , and Jack D Lange, M D Fourth edition Sextodecimo of 282 pages, illustrated Chicago, University Medical Publishers, 1946 Board, $1 50

The purpose of this *Physician's Handbook* is to summarize diagnostic procedures and factual data which a physician must have quickly available An effort has been made to include a relatively complete laboratory manual and other information which one might otherwise forget

NELSON M HOLDEN

The Nervous Child. By Hector Charles Cameron, M D Fifth Edition Duodecimo of 252 pages New York, Oxford University Press, 1946 Cloth, $3 00

The author has attempted to enumerate in this small volume all the traits and symptom complexes encountered in the child commonly termed "nervous" The material is compiled into separate chapter headings, and, as a result, has, of necessity, been treated somewhat sketchily It does make interesting reading and serves a good purpose in focusing on the fact that the hygiene of the child's mind is as important to the physician as is the child's body

MARK J WALLFIELD

The Thematic Apperception Test. The Theory and Technique of Interpretation. By Silvan S Tomkins, Ph D Octavo of 297 pages New York, Grune & Stratton, 1947 Cloth, $5 00

This test was first published in 1935 by Morgan and Murray It is based on a series of pictures, the observer is instructed to create a dramatic story around them, thus revealing his own inner life

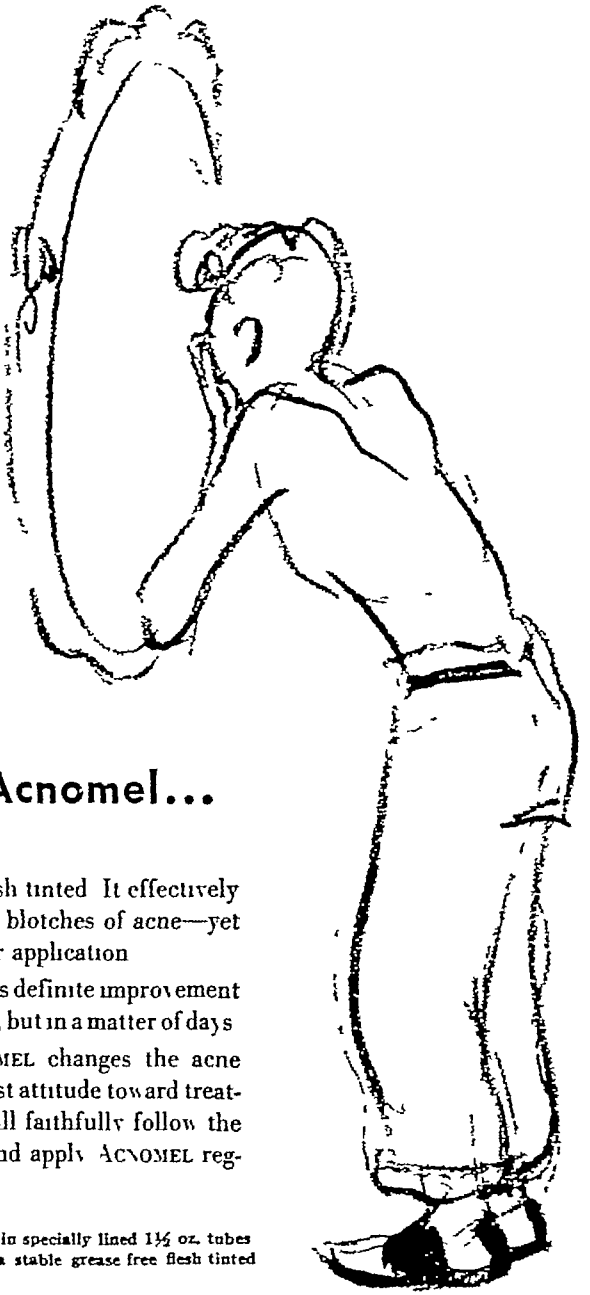
The author states that the thematic apperception test has proved useful in the exploration of child development, social attitude and sentiments, assessment of military personnel, and most recently, culture and personality

The book is well written and documented with many references It is of value, however, only to those interested in psychology and practicing psychiatry

STANLEY S LAMMI

Progress in Gynecology Edited by Joe V Meigs, M D , and Somers H Sturgis, M D Octavo of 552 pages, illustrated New York, Grune & Stratton, 1946 Cloth, $7 50

The book consists of a series of papers written on various subjects in gynecology, bringing up to date the newer knowledge The volume is divided into ten sections covering every phase of gynecology, commencing with growth and physiology and including functional disorders, endocrine glands, benign and malignant growths, the newer operative technics and postoperative care



For the up-to-date gynecologist the book is a short review Its greatest usefulness will be found by those physicians interested in gynecology, who have been away from practice during the war years

JACOB HALPERIN

Reconstructive and Reparative Surgery By Hans May, M D Quarto of 964 pages, illustrated Philadelphia, F A. Davis Co , 1947 Cloth $15

The author covers a wide field, including most of the tissues and regions of the body He begins with the general principles of transferring tissues He details such varied procedures as esophagoplasty and the correction of facial, breast, and genital deformities For cancer of the breast the plastic closure is stressed rather than the complete removal of the neoplasm

[Continued on page 98]

Your acne patient

cooperates

when you prescribe Acnomel...

Because ACNOMEL is delicately flesh tinted It effectively masks the blemishes and blotches of acne—yet is virtually invisible after application

ACNOMEL ordinarily brings definite improvement —not in months or weeks, but in a matter of days

Thus, the use of ACNOMEL changes the acne patient's typically defeatist attitude toward treatment Encouraged, he will faithfully follow the regimen you prescribe and apply ACNOMEL regularly, as you direct

Available on prescription only in specially lined 1½ oz. tubes Resorcinol 2% Sulfur 8% in a stable grease free flesh tinted vehicle.

Smith, Kline & French Laboratories, Philadelphia

Acnomel

a significant advance, clinical and cosmetic,

in acne therapy

[Continued from page 96]

This book will probably appeal most to the isolated surgeon who must, himself, perform all types of plastic surgery WILLIAM H FIELD

Calcium and Phosphorus in Foods and Nutrition By Henry C Sherman Octavo of 176 pages, illustrated New York, Columbia University Press, 1947 Cloth, $2 75

This book contains factual information about calcium and phosphorus as they relate to the human body and its nutrition The author has devoted a sizable chapter to the subject of phosphorus

The bibliography at the end of the book does not have to be followed from page to page, as is common in current periodicals The discussions are purely informative and clinical and should be of value to all interested in these elements MORRIS ANT

The Practice of Physical Medicine By Heinrich F Wolf, M D Octavo of 322 pages, illustrated Chicago, Wilcox & Follett Co , 1947 Cloth, $5 00

In compiling this book Dr Wolf has made a distinct contribution to the better understanding of physical medicine He has drawn upon his long and extensive experience in the field, and, by a process of evaluation and elimination, has presented a true present-day view of the useful methods used In some instances Dr Wolf's opinions differ rather sharply from those usually accepted, but these opinions are based upon actual observation and must not be considered to be without merit

The book is well written and clearly printed and illustrated It will make a most desirable addition to the library of the student and practitioner of physical medicine JEROME WEISS

Morphologic Hematology *Special Issue No 1 of Blood, the Journal of Hematology* Editorial Board, William Damashek, M D , Editor-in-Chief Large Octavo of 200 pages, illustrated New York, Grune & Stratton, 1947 Cloth, $4 75

This issue of *Blood* offers illuminating articles on the bone marrow and lymph node aspirations Intensive studies are presented embracing the red cell and white cell series There are special studies on anemia and phagocytic functions in man and animals A new departure in the study of adhesiveness and agglutination of platelets is undertaken in three articles All in all, this is a valuable contribution, one that the expert and student of physiology cannot afford to miss MAURICE MORRISON

An Approach to Social Medicine By John D Kershaw, M D Octavo of 329 pages Baltimore, Williams & Wilkins Co , 1946 Cloth, $4 50

This work consists of 329 pages, well printed on good paper, and contains a small bibliography as well as an index The reader will find that the text is not written for the medical profession alone, but also for the laity It is well written and will be appreciated by those interested in good literature C T GRAHAM-ROGERS

Dermatology in General Practice By Sigmund S Greenbaum, M D *Quarto of 889 pages,* illustrated Philadelphia, F A Davis Co , 1947 Cloth, $12

This book is excellent for the purpose for which it was written An unusual feature is the placing of the various diseases in alphabetic order rather than in various classifications as is more common in dermatologic literature

The author remarks that all classifications break down as certain diseases, even with our present knowledge, defy classification For this reason the alphabetic listing is probably as good as any, if not better Altogether, this book is to be highly recommended JOHN C GRAHAM

Psychopathology and Education of the Brain-Injured Child. By Alfred A Strauss and Laura E Lehtinen Octavo of 206 pages, illustrated New York, Grune & Stratton, 1947 Cloth, $5 00

The authors are psychoeducational consultants in Evanston, Illinois, and are connected with a school for brain-injured children

The book is divded into two sections, one comprising psychopathology and the second section devoted to education of the brain-injured child This latter section is especially useful, as it indicates the specific disabilities in arithmetic, reading and writing, and the method for correction

This is a good book and is highly recommended to the profession STANLEY S LAMM

The Compleat Pediatrician Practical, Diagnostic, Therapeutic and Preventive Pediatrics For the Use of Medical Students, Interns, General Practitioners, and Pediatricians By Wilburt C Davison, M D Fifth Edition Octavo of 348 pages Durham, North Carolina, Duke University Press, Cloth, $3 75

This reviewer has had the opportunity to compare the present fifth edition with the original first and can only marvel at the way all modern advances in diagnosis and therapy have been kept up to date, to mention only the Rh factor and the use of streptomycin

The medical student, general practitioner and pediatrician will find this truly encyclopedic yet practical volume good reference reading MARK J WALLFIELD

Ear, Nose and Throat. Symptoms—Diagnosis—Treatment By George D Wolf, M D Octavo of 523 pages, illustrated Philadelphia, J B Lippincott Co , 1947 Cloth, $10

The author sets out to prepare a treatise on a very difficult subject and intends this volume to be for general office practice He accomplishes his task in an admirable manner, with the result that this book serves not only the purposes of a busy practitioner but definitely fulfills a need for students and nurses The text is prepared simply, but at the same time is complete in every detail and includes a chapter on allergy The illustrations and color plates are unusually well done The practitioner will do well to keep this book on his desk for ready reference SAMUEL ZWERLING

Communicable Diseases By Franklin H Top M D and collaborators *Second edition* Octavo of 992 pages, illustrated St Louis, C V Mosby Co , 1947 Cloth, $8 50

This book seems to contain all that anyone should know adequately to diagnose, prevent, and care for the diseases mentioned

A handbook it is not, by definition "A small guidebook or manual" This book contains 992 numbered pages If it were called encyclopedic, or better still, monographic, that would not lead the reader astray Each chapter is complete in itself, and, if one wants to read farther he has an extensive bibliography

[Continued on page 100]

An interesting new development in inunction therapy

Because of the constant demand for an external preparation that can be safely used as a "home remedy," we have developed Rub A-535

Rub A-535 is intended for the symptomatic relief of those conditions for which external analgesics and counter-irritants are commonly used Rub A-535 contains a combination of analgesics with a high percentage of methyl-salicylate in a new type of greaseless, stainless, vanishing base, which permits ease of application and almost instant utilization of the medications

Because home remedies are used generally, we believe the manufacturer has a dual responsibility He must offer only such products which may safely be used in the average household and must inform the medical profession of the products ingredients and action

The formula of Rub A-535 is

Methyl-Salicylate	12%
Oil of Eucalyptus	½%
Menthol	1%
Camphor	1%
Base (specially prepared)	85½%

Rub A-535 has been thoroughly tested both clinically and in over 6,000 homes If you would like a tube of Rub A-535, just drop us a line

THE DENVER CHEMICAL MANUFACTURING COMPANY, Inc
163 Varick Street New York 13, N Y

[Continued from page 98]

One would have to seek microscopically to find errors or omissions, but this reviewer supposed that it was standard procedure, in this country at this time, to take rectal temperatures "unless contraindicated" Besides age and intelligence, this eliminates the necessity of deciding the degree of mental activity in doubtful cases

This reviewer, demanding hand-washing, disbelieves its adequacy in protecting one patient from another, particularly in going from one baby to another The operating surgeon wears gloves over his "clean" hands, even in a sterile operation This applies particularly to epidemic diarrhea of the newborn

W D LUDLUM

Hodgkin's Disease and Allied Disorders. By Henry Jackson, Jr , M D , and Frederic Parker, Jr , M D Quarto of 177 pages, illustrated New York, Oxford University Press, 1947 Cloth, $6 50

This volume presents the point of view of two eminent students of Hodgkin's disease It is well arranged, complete and absolutely reliable It is a magnificent reference book for its own content and for its bibliography

ANDREW BABEY

Encyclopedia of Medical Sources By Emerson Crosby Kelly, M D Octavo of 476 pages Baltimore, Williams & Wilkins Co , 1948 Cloth, $7 50

This work will be enormously useful to anyone having occasion to consult, list, or verify original references, and this applies to all active medical men There must be few important omissions, we searched for one a long time until finally failing to find a mention of Huggins of prostatic cancer distinction However, this criticism verges on the captious in the case of a work of such excellence

ARTHUR C JACOBSON

Hospital Care in the United States A Study of the Function of the General Hospital, Its Role in the Care of All Types of Illness, and the Conduct of Activities Related to Patient Service, with Recommendations for Its Extension and Integration for More Adequate Care of the American Public. By the Commission on Hospital Care Octavo of 631 pages, illustrated New York, Commonwealth Fund, 1947 Cloth, $4.50

In November, 1947, Mr Bernard M Baruch was widely quoted as recommending more and better doctors and hospitals and urging the medical profession to get in and pitch and stop fighting a rear guard action

In preparation for its part, leaders of medical thinking will find this an excellent source book The summary of conclusions and recommendations is excellent The detailed supporting material upon which they are based contains the facts

No intelligent discussion of the hospital problem in the United States of America can be carried on without the type of background provided in this volume

ALEC N THOMSON

Paravertebral Block in Diagnosis, Prognosis, and Therapy Minor Sympathetic Surgery By Felix Mandl, M.D Translated by Gertrude Kallner, M D Octavo of 330 pages, illustrated New York, Grune & Stratton, 1947 Cloth, $6 50

This monograph on paravertebral block contains a scholarly compilation of knowledge which is of special value to the internist and surgeon

After an introductory section on anatomy and technic, the use of sympathetic nerve block in differential diagnosis and as a test method is discussed

The rest of the book covers the value of paravertebral block in angina pectoris, thrombophlebitis, and in the treatment of certain phases of causalgia, phantom limb, and reflex dystrophy of the extremities, as well as in other conditions

The book is well written and very informative

WILLIAM SHEINFELD

War Stress and Neurotic Illness By Abram Kardiner, M D with the collaboration of Herbert Spiegel, M D Second Edition of The Traumatic *Neuroses of War* Octavo of 428 pages New York, Paul B Hoeber, Inc , 1947 Cloth, $4 50

Psychiatric disorders following the two World Wars attracted the attention not only of physicians but also of all intelligent people Dr Kardiner studied the chronic cases of these mentally sick people and wrote *Traumatic Neuroses of War* Following the second World War he collaborated with Dr Spiegel, who had a rich experience with the acute cases of the last World War, and published this second edition of his work under the above title

It is a complete and thorough analysis of the subject, dealing with every phase of the illness There are many interesting case histories illustrating various aspects of the subject It is difficult to review the book because it is so scientific, so well written, and so splendidly presented that only praise can be given to it It is highly recommended as an authoritative and illuminating volume on war neurosis

IRVING J SANDS

A Primer of Cardiology By George E Burch, M D , and Paul Reaser, M D Octavo of 272 pages illustrated Philadelphia, Lea & Febiger, 1947 Cloth, $4 50

This is an excellent primer in cardiology which is well organized, authoritative, and easy to read It contains a great quantity of useful information Others besides medical students would profit by a careful study of its abundant fundamental information

ANDREW BABEY

Diseases of the Gallbladder and Allied Structures Diagnosis and Treatment. By Moses Behrend, M D Octavo of 290 pages, illustrated Philadelphia, F A Davis Co , 1947 Cloth, $7 00

The outstanding feature of this thorough, concise and up-to-date publication is its fifty pages of drawings of anatomic relations and anomalies of the gallbladder, ducts, and arteries, drawn from anatomic dissections at the Baugh Institute of Anatomy

The presentation of the medical treatment suffers because too much disjointed information is crowded into the chapter The author's preference for the delayed operation for acute cholecystitis is open to question His use of heavy catgut material may also be open to discussion Several errors in definition of terms relative to surgical anatomic structures will, no doubt, be corrected

Nevertheless, this book is a most worthwhile addition to one's library

LEWIS E SCHOTTENFELD

Human Gastric Function An Experimental Study of a Man and His Stomach. By Stewart Wolf, M D , and Harold G Wolff, M D Second edition Octavo of 262 pages, illustrated New York, Oxford University Press, 1947 Cloth, $5 00

"Tom's stomach," as visualized and studied by

[Continued on page 102]

[Continued from page 100]

Wolf and Wolff, promises to become as enduring as is man's curiosity, nay, the intense desire to know the "all" of gastric functions and its aberrations The contributions made by these observers in the two editions of this book will be the more valued as time adds experience and further knowledge to that which they have revealed

One can have no words but those of praise for such a work so well done B M BERNSTEIN

Pye's Surgical Handicraft. A Manual of Surgical Manipulations, Minor Surgery, and Other Matters Connected with the Work of Surgical Dressers, House Surgeons, and Practitioners Edited by Hamilton Bailey, F R C S Fifteenth edition Octavo of 668 pages, illustrated Baltimore, Williams & Wilkins Co , 1947 Cloth, $7 00

This edition brings a practical handbook suited to the needs of hospital house officers and general practitioners up to date Numerous minor surgical, routine hospital, and medical procedures are described tersely and illustrated aptly Blood transfusion, gastric lavage, stomach and intestinal intubation, abdominal and thoracic paracentesis, to mention only a few procedures, are shown

For the country doctor and the "rotating intern" this book should be a most valuable guide

WILLIAM SHEINFELD

A Hand-Book of Ocular Therapeutics By Sanford R Gifford, M D Revised by Derrick Vail, M D Fourth edition Octavo of 336 pages, illustrated Philadelphia, Lea & Febiger, 1947 Cloth, $5 00

Dr Vail and his assistants have completely revised Dr Gifford's work on ocular therapeutics The section on disorders of muscular apparatus has been dropped, the author feeling, and rightly so, that this topic rates a more exhaustive treatise The reviewer found the sections on drugs and organic extracts used in ophthalmology and the discussions of therapy in retinitis pigmentosa and myopia of especial interest The latest thought on the antibiotics is quite instructive Dr Vail's revision should be a gratifying addition to the library of any ophthalmologist, and especially to one who has spent any time in the armed forces

CHARLES E R HOPKINS

Diagnosis in Daily Practice An Office Routine Based on the Incidence of Various Diseases By Benjamin V White, M D , and Charles F Geschickter, M D Octavo of 693 pages, illustrated Philadelphia, J B Lippincott Co , 1947 Cloth, $15

This volume, like others which are designed to help the practitioner make a quicker diagnosis from leading signs and symptoms, contains a vast quantity of sound information and many magnificent colored photographs illustrating common clinical conditions Scattered throughout the pages are numerous useful tables of differential diagnosis For the practitioner and mature student it should prove useful, mainly because of the abundant information it contains and not because it presents a new "system" making diagnosis a mechanical procedure

ANDREW BABEY

Trichomonas Vaginalis and Trichomoniasis. By Ray E Trussell, M D Octavo of 277 pages, illustrated Springfield, Ill , Charles C Thomas, 1947 Cloth, $6 00

This is not the last word on trichomonas vaginalis, but a complete summary of all that is known of this troublesome and common parasite An immense amount of well-organized research of extraordinary interest to every gynecologist will be found here The introduction by E D Plass is worth while, too

CHARLES A GORDON

Pathology of Tumors By R A Willis, M D Octavo of 992 pages, illustrated St Louis, C V Mosby Co , 1948 Cloth, $20

This text on tumors covers the experience of the author during a period of twenty years as a hospital pathologist It is divided into two parts, dealing, respectively, with general properties of tumors and specific tumors of various regions of the body It is replete with numerous illustrations of excellent quality It carries at the end of each chapter an ample list of references

It is a very readable text and can be recommended to pathologists and workers in the clinical field

THEO J CURPHEY

Nursing in Modern Society By Mary Ella Chayer, R N Octavo of 288 pages New York, G P Putnam's Sons, 1947 Cloth, $4 00

Controversial problems of nursing are discussed in this book The ideas are set forth clearly and concisely The main theme is that the professional nurse needs better preparation for her job Good public relations is suggested for professional nurses, also an awareness of the changing situations in the world Selection of students for practical nursing should be on the same basis as professional nurses, so that, when they can, they may continue their education and training for professional nursing

MARIE M BEHLEN

On Hospitals By S S Goldwater, M D Octavo of 395 pages, illustrated New York, Macmillan Co , 1947 Cloth, $9 00

Through Dr Goldwater's vast experience in hospital administration and building, this book was made possible It is clearly written, has good illustrations, and is well organized The section on administration and organization should prove useful to students, boards of directors, and administrators

The patient and the community are carefully considered in regard to treatment and changes The descriptions, diagrams, and suggestions for hospital building reflect the great interest and understanding Dr Goldwater had in hospital architecture

JOSEPH TENOPYR

The Medical Clinics of North America Boston Number September, 1947 Octavo Philadelphia, W B Saunders Co , 1947 Published bi monthly (six numbers a year) Cloth, $16 net, paper, $12 net

This Boston number has valuable papers on hepatitis, edema in Bright's disease, streptomycin in meningitis, hypertension, hematology, epilepsy, and neostigmine Careful study of this volume will prove profitable ANDREW BABEY

Pictorial Handbook of Fracture Treatment. By Edward L Compere, M D , and Sam W Banks, M D Revised with the assistance of Clinton L Compere, M D Illustrated by Harold Laufman M D Second edition Large duodecimo of 390 pages, illustrated Chicago, Year Book Publishers, 1947 Cloth, $5 50

The second edition of the *Pictorial Handbook of*

[Continued on page 104]

an entirely new approach to the treatment of pain

The intensity of pain is determined, in no small degree, by the patient's mood It follows that any measure which will lessen your patient's preoccupation with his pain will actually make him feel his pain less

EDRISAL contains two analgesics of established effectiveness But, just as important, it also contains the logical anti-depressant, Benzedrine* Sulfate Thus Edrisal not only relieves your patient's organic pain, but also relieves his anxiety over it In Edrisal, therefore, you have a unique weapon—a double-barreled weapon—for the relief of pain

Each Edrisal tablet contains acetylsalicylic acid (2 5 gr) phenacetin (2 5 gr) and Benzedrine Sulfate (2.5 mg) For samples and full information, write us at 429 Arch St Philadelphia 5 Pa.

Smith, Kline & French Laboratories, Philadelphia

Edrisal

its dual action relieves pain • lifts mood

[Continued from page 102]

Fracture Treatment is a comprehensive symposium of the basic principles of diagnosis and treatment Students, interns, and surgeons will find this revised and profusely illustrated handbook informative, thorough, and specific in its recommendations in the treatment of the typical entities The procedures are depicted chiefly by diagrams with a concise but adequate description of procedures which are generally accepted

IRWIN E SIRIS

Clinical Diagnosis by Laboratory Methods. By James Campbell Todd, M D , and Arthur Hawley Sanford, M D , with the collaboration of George Giles Stilwell, M D Eleventh edition Octavo of 954 pages, illustrated Philadelphia, W B Saunders Co , 1948 Cloth, $7 50

The eleventh edition of *Clinical Diagnosis by Laboratory Methods* by Todd and Sanford maintains the excellent reputation established by all the preceding editions during the past forty years The reviewer has possessed and steadily used the succeeding editions as they appeared and has never been disappointed in their usefulness In the same way this most recent edition has been completely modernized and amplified One cannot itemize all the improvements, they are so numerous Suffice to say that this book is an essential for the laboratorian, be he professionally or technically employed, as well as for the physician, general practitioner, or specialist

MAX LEDERER

The Practice of Mental Nursing By May Houliston, R M N (Eng) Duodecimo of 164 pages Baltimore, Williams & Wilkins Co , 1947 Cloth, $2 75

This is a useful book for junior nurses in mental hospitals, but it is not sufficient to take the place of a regular textbook on psychiatric nursing It is clearly written, concise, and well organized The definitions are good and the nursing care is well outlined

The book could be used in general hospitals and could be put into the hands of students in preparation for psychiatric affiliation

MARIE M BEHLEN

Diseases of the Nose, Throat and Ear By William Lincoln Ballenger, M D , and Howard Charles Ballenger, M D , assisted by John Jacob Ballenger, M D Ninth edition Octavo of 993 pages, illustrated Philadelphia, Lea & Febiger, 1947 Cloth, $12 50

This is the same dependable, comprehensive textbook brought up to date by inclusion of the latest concepts in respect to headaches and neuralgias, surgical treatment of otosclerosis (fenestration), and allergies

The revision of outstanding importance is the author's acknowledgment that nasal reconstruction (rhinoplasty) belongs naturally in the domain of the rhinologist

This volume will serve as standard reference for students, general practitioners, and specialists

HARRY MEYERSBURG

Colloid Science A Symposium. Contributors E K. Rideal, A E Alexander, D D Eley *et al* Octavo of 208 pages, illustrated Brooklyn, Chemical Publishing Co , 1947 Cloth, $6 00

This is a symposium of a study of the chemical, physical, and mechanical properties of colloid matter It includes the determination of the atomic and molecular structure, submicroscopic texture, and general shape of the more complex organic molecules which are of biologic importance, using x-ray analysis and optical measurements There is a study of macromolecules by means of the ultracentrifuge, electrophoresis, and diffusion It should be of aid in interpreting the phenomena encountered with matter in the form of films, membranes, and fibers

EDWARD H NIDISH

American Medical Research Past and Present. By Richard H Shryock, Ph D Octavo of 350 pages New York Commonwealth Fund, 1947 Cloth, $2 50

This is one of a number of monographs made possible by the Commonwealth Fund as the result of the study made by the Committee on Medicine and the Changing Order It covers in an exhaustive and readable manner the "story of medical research" from 1750 to the present day, with its trends, influences, sources of support, its impact on medical education, and its effect on society in general

BENJAMIN M BERNSTEIN

Modern Cosmeticology By Ralph G Harry Third edition Octavo of 515 pages, illustrated Brooklyn, Chemical Publishing Co , 1947 Cloth, $12

It was my real pleasure to review a former edition of this famous book for the NEW YORK STATE JOURNAL OF MEDICINE It is only now that I have been able to secure a copy for my own use No review, so limited as we are compelled to be for space, can begin to express one's appreciation of the vastness of its contents and the completeness of its technical information It is one book that every dermatologist and every cosmeticologist should have at hand for constant reference use

NATHAN THOMAS BEERS

Treatment of Some Chronic and "Incurable" Diseases By A T Todd, M D (Edin) Second edition Octavo of 324 pages Baltimore, Williams & Wilkins Co , 1947 Cloth, $7 00

This book has some good and some bad features, and the bad could be so misleading that the book cannot be recommended generally In the management of diabetes the author suggests that insulin is not always beneficial and may be harmful, for it puts the pancreas at rest and perpetuates the diabetic state Whenever possible, he adds, it should be discontinued as early as possible He also recommends the taking of synthalin by mouth

In his opinion, a hepatic defect is "central and dominant" in the cause of rheumatism He also recommends fluoride plus iodine in toxic goiter

ANDREW BABEY

Medicine Today The March of Medicine, 1946 The New York Academy of Medicine Lectures to the Laity New York, Columbia University Press, 1947 Cloth, $2 00

The doctor, as well as the lay reader, will find much to interest and edify him in this most recent symposium of the Academy's annual series It holds the mirror up to modern medicine in an enlightening, even though at times disturbing, way The order of things in medicine is changing and this small volume points up new directions *Reading it* makes one feel a bit like Christian in the *Pilgrim's Progress* as he faced successive challenges The question is, can we, too, reach the Delectable Moun-

tains if we abandon individualism and loosen the patient-physician bond on the way?

ARTHUR C JACOBSON

Atlas of Bacteriology By R Cranston Low, M D, and T C Dodds Octavo of 168 pages, illustrated Baltimore, Williams & Wilkins Co, 1947 Cloth, $8 50

The 167 colored illustrations are superb and very explanatory The *Atlas* can be highly recommended for students and laboratory technicians

NATHAN REIBSTEIN

Diabetes Mellitus in General Practice By Arthur R Colwell, M D Octavo of 350 pages, illustrated Chicago, Year Book Publishers, 1947 Cloth, $5 25

The outstanding virtue of this fine volume is the simplicity with which the problem of diet and the diabetic is presented The usual mysticism surrounding the diet prescription is torn aside The tables of substitutions and household equivalents are excellent

The author moves easily from one camp to the other in the current "cold war" regarding hyperglycemia, but, fortunately, so far as this reviewer is concerned, he rests himself periodically with those who know insulin shock to be a great hazard, rather than with those who unphysiologically condemn hyperglycemia

The discussion of the complications of diabetes is splendid

MAURICE TULIN

The Practical Nurse By Dorothy Deming, R N Octavo of 370 pages New York, Commonwealth Fund, 1947 Cloth, $3 00

This book gives substantial reasons for the renewed demand for the practical nurse today and in the days to come The author gives a clear insight into many problems relative to the entire nursing profession, including those of the professional nurse

The author did a thorough job by personally visiting many hospitals and industrial establishments where positions are being filled successfully by the practical nurse, alone as well as with her professional colleague

HARRY APFEL

Handbook on Fractures By Duncan Eve, Jr, M D, in collaboration with Trimble Sharber, M D Octavo of 263 pages, illustrated St Louis, C V Mosby Co, 1947 Cloth, $5 00

Handbook on Fractures is a valuable book for the resident surgeon and specialist, as it has a definite purpose in emphasizing the treatment of a specific entity It is the result of the author's extensive experience with procedures which have given him uniformly good results It does not go into discussion of controversial procedures It is concise but clear in its recommendations and should be valuable to the surgeon interested in fractures

IRWIN E SIRIS

The Medical Clinics of North America. Philadelphia Number November, 1947 Index 1945–1947 Octavo Philadelphia, W B Saunders Co, 1947 Published bi-monthly (6 numbers a year) Cloth, $16 net, paper, $12 net

This timely volume of *Clinics* presents a symposium on respiratory diseases including sinusitis, allergic rhinitis, and the various viral infections as well as a chapter on chemotherapy of tuberculosis

This volume is worth careful study

ANDREW BABEY

A Manual of Fractures and Dislocations By Barbara Bartlett Stimson, M D Second edition Duodecimo of 223 pages, illustrated Philadelphia, Lea & Febiger, 1947 Flexible cloth, $3 25

This excellent book is now in its second edition Although the subject is not covered exhaustively, methods of diagnosis and principles of treatment are clearly indicated

The material is presented under definite headings, which makes for ready understanding and easy readability The summary at the end of each discussion is of great value

The book is heartily recommended as a quick reference guide

MAYER E ROSS

Medicine in the Changing Order Report of the New York Academy of Medicine Committee on Medicine and the Changing Order, Malcolm Goodridge, M D, Chairman Octavo of 240 pages New York, Commonwealth Fund, 1947 Cloth, $2 00

In perusing this little volume one cannot help but be impressed with the authoritativeness of the source of all the information contained therein and the absolutely unbiased approach to every phase of this subject The vast amount of discussion in recent years among medical groups, as well as among the laity, as to the best method of providing adequate medical care to all the people is analyzed here in minute detail All interested in this important subject are urged to read this book, it has all the answers

It is gratifying to read some of its conclusions as to the best method to attain the desired goal—comprehensive medical service Here are some of them For optimal results, organization and cooperation of physicians is required Extensive education for both physicians and the public is another desirability In acknowledging government participation, the Committee strongly recommends a general method of grants-in-aid as the one that has stood the test of American experience

No physician can approach a serious discussion of voluntary and compulsory health insurance in all their phases without a thorough reading and understanding of this exceptionally well-written volume

S R BLATTEIS

A Textbook of Clinical Neurology With an Introduction to the History of Neurology By Israel S Wechsler, M D Sixth edition Octavo of 829 pages, illustrated Philadelphia, W B Saunders Co, 1947 Cloth, $8 50

This reviewer admits at the onset a favorable prejudice for this product of Israel Wechsler's pen This book is a real clinical neurology, well rounded in scope with no undue emphasis on a writer's hobby As an able clinician, he naturally stresses the careful taking of a history and the importance of examining the patient, so often neglected by "arm chair" psychiatrists

The author was the first to introduce in a textbook of neurology a description of the psychometric examination, an evaluation of trauma to the nervous system, and an introduction to the history of neurology In his clinical approach there is no neglect of the psychosomatic aspect ably presented in a clear practical discussion of the neuroses Like Osler, Dr Wechsler is a master of the pithy phrase, a characteristic which enables him to describe clearly rare clinical entries For the medical student there is

no better textbook To the neurologist or general practitioner it will prove a welcome new edition

HAROLD R MERWARTH

A Study of Individual Children's Diets By E M Widdowson Octavo of 196 pages, illustrated London, His Majesty's Stationery Office, 1947 Board, 6/

The book covers a four-year study in nutrition of over 1,000 British children of ages from one to eighteen years Some 30,000 individual meals are tabulated and analyzed The study shows some children doing better than average in point of development without any milk in their menus Calorie requirements are based on weight and height rather than on age, similar to the old "NEM" method of Pirquet Some feeding trends of former years are mentioned when children were given beer, and cheese was strenuously forbidden as dangerous

HARRY APFEL

New Fields of Psychiatry By David M Levy, M D Octavo of 171 pages New York, W W Norton & Co, 1947 Cloth, $2 75

Dr Levy, in this book, enlarges on the material which he gave in the Salmon Lectures, describing the application of principles and knowledge derived from psychiatry as applied to the practical problems of criminology, social work, education, military service, and political indoctrination The volume is well documented, with references to work in these various disciplines, and is rendered dynamic by the author's personal experience as he watched and contributed to the development of these fields of thought

EDWARD F FALSEY

Uterotubal Insufflation A Clinical Diagnostic Method of Determining the Tubal Factor in Sterility Including Therapeutic Aspects and Comparative Notes on Hysterosalpingography By I C Rubin, M D Octavo of 453 pages, illustrated St Louis, C V Mosby Co, 1947 Cloth, $10

This book merits a position as one of the most important contributions to our present knowledge in the study of infertility There has been no other single procedure in the investigation of the problem of sterility that has in itself been as conclusive in ascertaining a particular factor as the uterotubal insufflation of gas This epochal procedure was first brought to our attention by the author in 1919

Dr Rubin has critically searched and reviewed the literature, avoiding the speculative and controversial, digested it, and handed it back to the reader in an assimilable form He has maintained the clinical viewpoint of the application of the uterotubal insufflation throughout his text and has correlated this with both the physiology and pathology of the fallopian tubes He augments this with many illustrative and concise case histories, as well as graphs and drawings, the latter being beautifully reproduced

This book is recommended as a valuable addition to the library of those interested in the problem of human infertility and will no doubt become one of the standard practical reference works on the subject.

SAMUEL L SIEGLER

English-Spanish Chemical and Medical Dictionary Comprising Terms Employed in Medicine, Surgery, Dentistry, Veterinary, Biochemistry, Biology, Pharmacy, Allied Sciences, and Related Scientific Equipment. By Morris Goldberg Octavo of 692 pages New York, McGraw-Hill Book Co 1947 Cloth, $10

This dictionary gives the Spanish equivalents of some 40,000 English words used in medicine and in physical and biologic science, together with brief explanations, in simple nontechnical language, of the meanings It is complete and includes all the recent chemotherapeutic and antibiotic terms A bibliography is appended

DENNIS RYAN GILLEN

The 1947 Year Book of General Medicine Edited by George F Dick, M D, J Burns Amberson, M D, George R Minot, M D, *et al* Duodecimo of 784 pages, illustrated Chicago, Year Book Publishers, 1947 Cloth, $3 75

This familiar perennial continues to deserve a position of favor in the physician's library The abstracts are done with skill by Dick, Amberson, Minot, Castle, Stroud, and Eusterman As usual, the editorial comments enhance the value of the abstracts The "Year Book Quiz" on the book jacket is a unique feature which will intrigue everyone

MILTON PLOTZ

Synopsis of Neuropsychiatry By Lowell S Selling, M D Second edition Duodecimo of 561 pages, illustrated St Louis, C V Mosby Co, 1947 Cloth, $6 50

This manual is the second edition of a book that has been intended to serve as a simplified and standardized guide in neuropsychiatry It covers the field of neurology and psychiatry amply and well In all, there are 28 chapters ranging from basic anatomic principles to mental deficiency It is not intended as a textbook, but simply as a broad outline in the field of neuropsychiatry

It is recommended for all who are interested in this field of medicine

IRVING J SANDS

What to Do Until the Psychiatrist Comes. By Norman Anthony Octavo of 150 pages, illustrated New York, Duell, Sloan & Pearce, 1947 Cloth, $2 50

This book is a collection of nonsensical clichés and definitions supposed to supply the demand for a "five-cent psychiatry" It is contended on the jacket that unless a man's "got bats in the upper brackets," he can't afford psychiatric treatment There are a few pertinent observations and drawings, some humorous, some ludicrous The fun, however, is rather thinned out by the 150 pages

JOSEPH RAPHAEL

Aphasia A Guide to Retraining By Capt Louis Garnich, MC, USA Appendix in collaboration with Sgt George W Pangle, MC, USA 108 pages New York, Grune & Stratton, 1947 Cloth, $2 75

The author served as a school psychologist for the Board of Education of the City of New York, specializing in problems of educational disability During the late War he served in the remedial language department, as the aphasic training unit was called, which was a part of the neurology section of the Thomas M England General Hospital, in Atlantic City They had a wealth of material and the results that they obtained were quite satisfactory

The book is based upon these experiences, is well formulated, and methods of rehabilitation are outlined It is a valuable little book that would be extremely useful to all who are interested in speech disorders, particularly in cases of aphasia resulting from cerebral vascular disorders or following brain injuries

IRVING J SANDS

"Imprisoned in every fat man,
a thin one
is wildly signaling to be let out."

C C. Palinurus, quoted in Bull New York Acad Med 24 2 (Feb) 1948.

Overeating imprisons the "thin one", and he can signal till doomsday, but he will never get out unless the "fat man" stops overeating.

'Dexedrine' Sulfate curbs appetite, makes it easy for the overweight patient to stop overeating and thus reduces weight safely without the use (and risk) of such potentially dangerous drugs as thyroid.

Dexedrine Sulfate Tablets & Elixir

The most effective drug for control of appetite in weight reduction

The most potent androgen...

PERANDREN

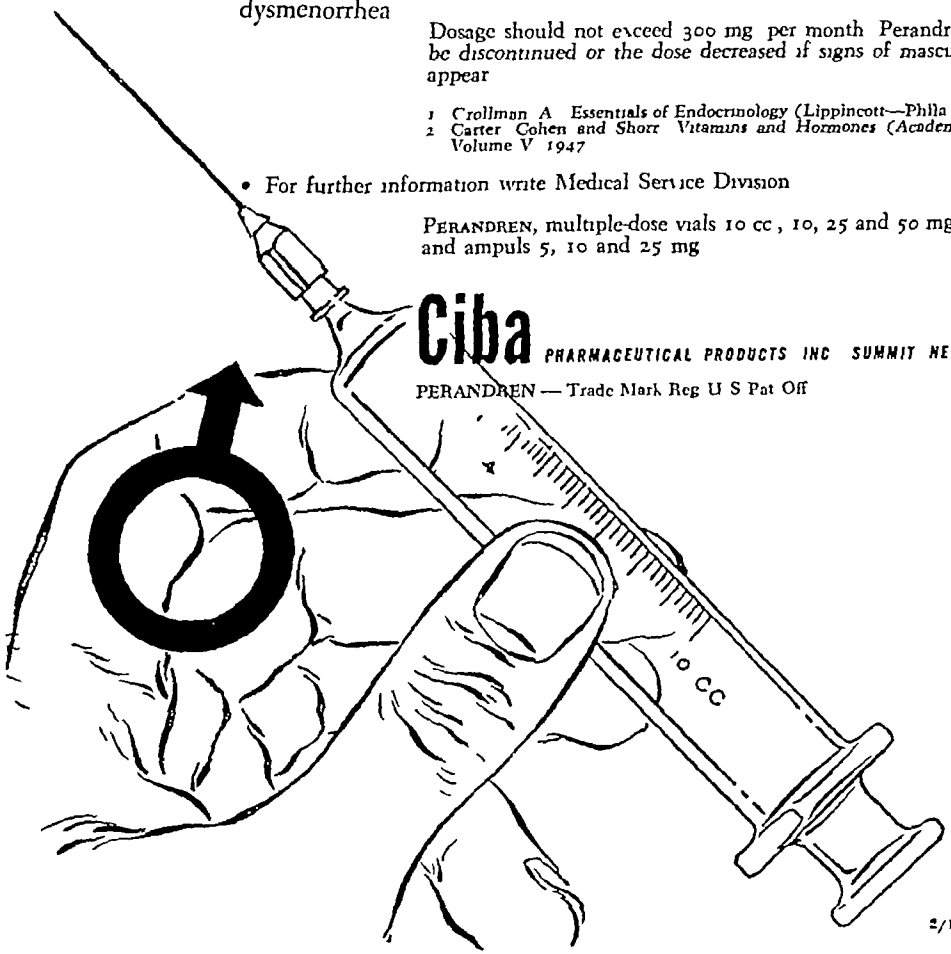
(testosterone propionate U S P XIII)

IN THE MALE "The principal usefulness has been as a replacement therapy when functional or organic testicular deficiency exists"[1]

The chief indications are the male climacteric, hypogonadism, and impotence due to glandular causes

Dosage is from 10 to 25 mg one to three times a week Perandren should be discontinued or the dose decreased if priapism supervenes, or if mental excitement occurs The amount administered to prepuberal boys should be insufficient to precipitate puberty

IN THE FEMALE "... the use of androgens in women has resulted in more effective management of a variety of clinical disorders"[2]



These include the menopausal syndrome, functional uterine bleeding and dysmenorrhea

Dosage should not exceed 300 mg per month Perandren should be discontinued or the dose decreased if signs of masculinization appear

Hypertension

Diagnostic and Prognostic Tests

FIRST OF A SERIES

BREATH-HOLDING TEST:[1,2] With the patient sitting in a quiet room, the blood pressure is determined at five minute intervals until a basal level is obtained This usually takes from twenty to forty-five minutes The test procedure is explained to the patient, followed by another brief rest period until the basal level is again reached

At an observed moment of normal quiet expiration the patient is instructed to compress both nostrils suddenly and simultaneously to close the mouth by compressing the lips The breath is held for twenty seconds during which the systolic rise is determined Following a rest period and return to the basal level, the same test is repeated in order to determine the diastolic rise (Normal systolic or diastolic rise does not exceed 22 mm)

SIGNIFICANCE: Holding the breath in normal expiration increases the carbon dioxide content of the alveolar air This is quickly reflected in the blood with stimulation of the vasomotor center and a resulting rise in the blood pressure In hypertensive patients the rise in pressure is from two to four times greater than in normal subjects

Test for yourself what throat specialists reported when a 30-day smoking test revealed:

"NO THROAT IRRITATION due to smoking CAMELS!"

MAKE YOUR OWN 30 DAY CAMEL MILDNESS TEST Smoke Camels, and only Camels, for 30 days Prove for yourself how mild Camels *are!*

Hundreds of men and women, from coast to coast, *recently made a similar test.* They smoked an average of one to two packs of Camels a day for 30 days Their throats were carefully examined by throat specialists And after a total of 2470 examinations—these throat specialists reported *"not one single case of throat irritation due to smoking Camels!"*

But prove it yourself in your T-Zone (T for Taste and T for Throat) Let YOUR OWN TASTE tell you about the rich, full flavor of Camels choice tobaccos. Let YOUR OWN THROAT give the good news of Camels cool, cool mildness.

R. J Reynolds Tobacco Co Winston-Salem, N C

According to a Nationwide survey:

MORE DOCTORS SMOKE CAMELS THAN ANY OTHER CIGARETTE

ctors smoke for pleasure, too! And when ee leading independent research organiza ns asked 113,597 doctors what cigarette they oked, the brand named most was Camel!

in ocular emergencies
prevent infection with
1 SULFACETIMIDE SOLUTION 30%
(SODIUM SULAMYD)

Prompt and continued use of SODIUM SULFACETIMIDE SOLUTION 30% eye drops immediately following removal of a foreign body—or after emergency treatment of abrasions, lacerations or burns due to chemicals—is rapidly gaining wide acceptance. Recent reports[1,2] emphasize the effectiveness of SODIUM SULFACETIMIDE SOLUTION 30% in preventing infection, hastening recovery and saving sight.

One of the few sulfonamides that can be dissolved in high concentration at physiologic pH of 7.4, sodium sulfacetimide is virtually nonirritating and nontoxic. Because sodium sulfacetimide penetrates into deep ocular tissues by rapid diffusion, protection against infection of underlying as well as superficial structures is achieved readily.

Patients should be instructed to instill one drop of solution into the traumatized eye every hour for the first day.[1] Thereafter the drops may be used every three or four hours until the threat of infection has ceased.

PACKAGING. SODIUM SULFACETIMIDE SOLUTION (Sodium SULAMYD®) 30% is available on prescription in 15 cc. amber eye-dropper bottles. SODIUM SULFACETIMIDE OPHTHALMIC OINTMENT (Sodium SULAMYD) is supplied in a concentration of 10% in ⅛ oz. tubes. SODIUM SULFACETIMIDE NASAL SOLUTION 10% with *dl*-desoxyephedrine hydrochloride 0.125% is available in 15 cc. bottle with dropper. Schering's Sodium Sulfacetimide (Sodium SULAMYD) preparations contain 0.05% methyl and 0.01% propyl *p*-hydroxybenzoates as preservatives and are stabilized with sodium thiosulfate.

Oropharyngeal Chemotherapy

A single tablet of White's Sulfathiazole Gum chewed for one hour maintains an average *salivary* drug concentration of 70 mg per cent, the gum vehicle serving as a reservoir for the drug Local absorption into pharyngeal submucosa is strikingly illustrated by orange-stained sulfonamide material illustrated in tonsillar tissue section above

without systemic side-effects

No systemic toxicity has been reported Following even maximal dosage, blood levels are usually immeasurable, rarely approaching 0 5 to 1 mg per cent

Groups of patients have received Sulfathiazole Gum routinely for six months[1] and fourteen months[2] "without a reaction indicating sulfathiazole sensitization or other untoward reaction"

Supplied in convenient packages of 24 tablets—3¾ grs (0 25 Gm) per tablet —sanitaped, in slip-sleeve prescription boxes

Patients turning up their "no's" at soft diets?

Try tasty, protein-rich Swift's Strained Meats!

A palatable, natural source of complete, high-quality proteins

It's not surprising that soft-diet patients develop appetite-apathy The things they have to eat!

To help overcome this anorexia many doctors now recommend Swift's Strained Meats Delicious, *real* meat that patients on soft, smooth diets can eat and *enjoy* Swift's Strained Meats provide an excellent base for a high-protein, low-residue diet Rich in iron, they're chemically and physically non irritating They make *all* the essential amino acids available *simultaneously* for optimum protein synthesis

Swift's Strained Meats are tasty enough to tempt tired appetites They supply goodly amounts of B vitamin to help stimulate patients' natural appetite for other foods Swift's Strained Meats are 100% meat—a variety of six kinds beef, lamb, pork, veal, liver, heart Originally prepared for infant feeding, they're exceptionally fine in texture—may easily be used in tube feeding Convenient—ready to heat and serve

6 varieties
Beef, lamb, pork
veal, liver heart

For patients who can take foods of less fine consistency—Swift's Diced Meats offer tender morsels of nutritious meats with tempting flavors patients appreciate

The makers of Swift's Strained Meats invite you to send for your copy of The Importance of Protein Foods in Health and Disease —a physicians handbook of protein feeding, written by a doctor Send to

Effective Topical Chemotherapy

For Both Acute and Chronic Infections of the

MIDDLE and EXTERNAL ear

White's

OTOMIDE

FUNGICIDAL
DEBRIDING
ANTIBACTERIAL
ANALGESIC

Practically all infections of the middle and external ear respond to local therapy with White's Otomide—a logical combination of therapeutic ingredients Its sulfanilamide content actively attacks both gram positive and gram negative bacteria and effectively combats fungi which commonly infect the external ear Added urea (carbamide) increases local tissue diffusion and concentration of the sulfanilamide, cleans and debrides infected areas, reduces objectionable odors Chlorobutanol is included for its analgesic and antipruritic properties

Formula

Sulfanilamide

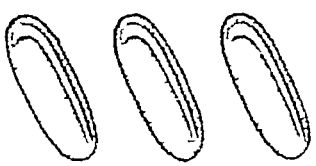
Urea (Carbamide)

Chlorobutanol (Anhydrous)

Glycerin of unusually high hygroscopic activity

Supplied in dropper bottles of ½ fluid ou (15 cc) White Laboratories, Inc , Pharmaceutical Manufacturers, Newark 7, N J

White's | **OTOMIDE**



To solve her problem...

ONE *Iberol tablet t.i.d.* IS ENOUGH

In only three tablets a day, IBEROL provides the important blood building and nutritional substances needed by many patients with secondary anemias. This dosage of IBEROL represents the accepted standard for a hematinic, plus generous amounts of folic acid, other B vitamins and ascorbic acid. ● For all their potency, IBEROL tablets are moderate in size—achieved by using the ferrous sulfate itself as one of two subcoatings. An outer sugar coating covers the liver odor and iron taste to make a tablet that is pleasant to take. The capsule shape makes it easy to swallow. This convenient, concentrated dosage form is comparatively economical for the patient. ● IBEROL may also be used prophylactically in pregnancy, convalescence, and other conditions predisposing to anemia. In pernicious anemia, it should be used only as a supplement to liver extract. IBEROL is available now in bottles of 100, 500 and 1000 sugar coated tablets.

ABBOTT LABORATORIES, North Chicago, Illinois

CRYSTALS OF
FOLIC ACID

Nutritional Research

During the past several years, Lederle has made a very substantial investment in time and money for the investigation of nutritional deficiency states The vast majority of such investigations lead down dead-end streets, but occasionally—and most fortunately for mankind—a brilliant result is achieved One of the fields in which these efforts have proven, and are proving, successful is the field of nutritional macrocytic anemias. The first step in the conquest of this field was the perfection of a practicable intramuscular liver extract by Lederle several decades ago More recently, the Lederle-Cyanamid research team isolated and synthesized folic acid, which has been proven specific for the macrocytic anemias of sprue, infancy and childhood, pregnancy, gastrointestinal dysfunction, and pellagra. We are close to a solution of many other similar nutritional problems FOLVITE* Folic Acid *Lederle*, in various forms, is available for prescription use.

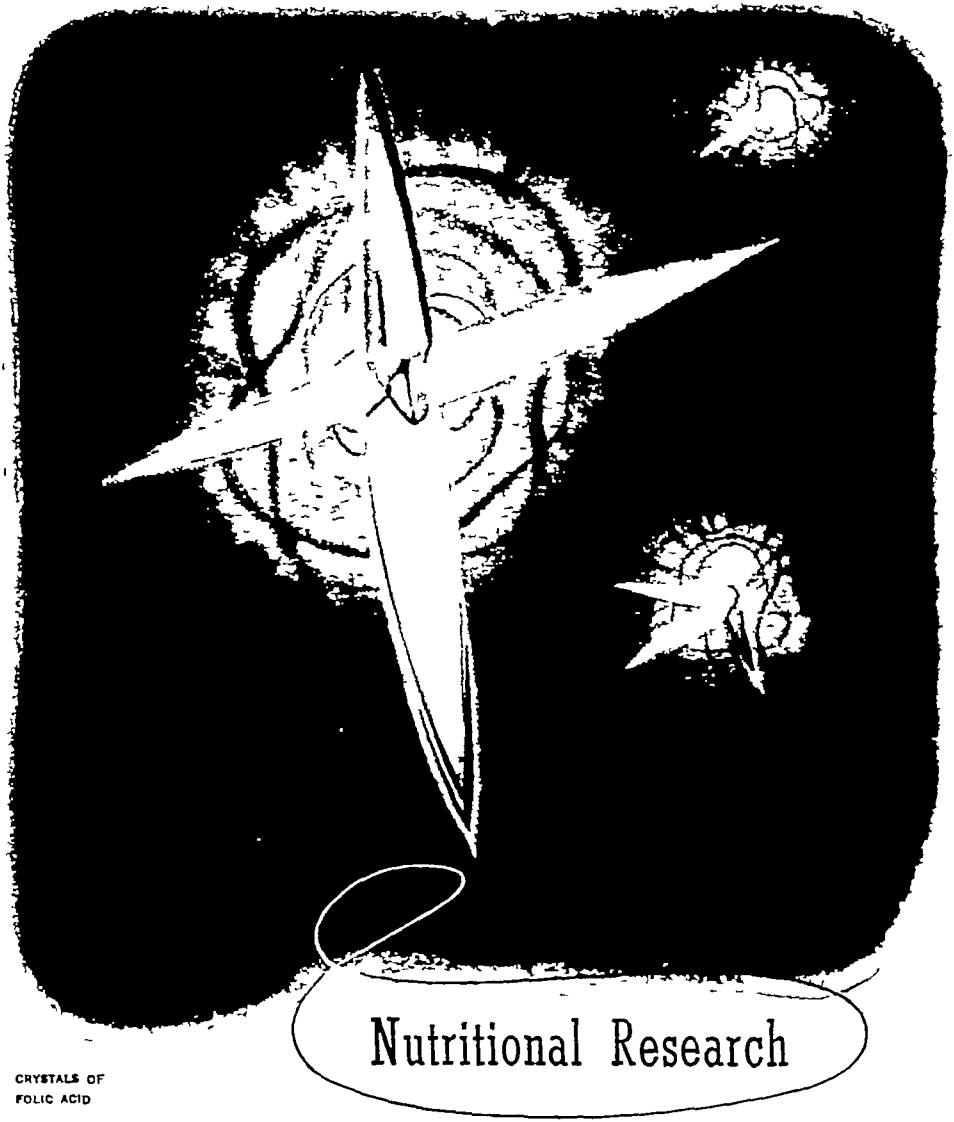
An interesting new development in inunction therapy

Because of the constant demand for an external preparation that can be safely used as a "home remedy," we have developed Antiphlogistine Rub A-535

Rub A-535 is intended for the symptomatic relief of those conditions for which external analgesics and counter-irritants are commonly used Rub A-535 contains a combination of analgesics with a high percentage of methyl-salicylate in a new type of greaseless, stainless, vanishing base, which permits ease of application and almost instant utilization of the medications



Because home remedies are used generally, we believe the manufacturer has a dual responsibility He must offer only such products which may safely be used in the average household and must inform the medical profession of the products' ingredients and action

The formula of Rub A-535 is

Methyl-Salicylate	12%
Oil of Eucalyptus	½%
Menthol	1%
Camphor	1%
Base (specially prepared)	85½%

Antiphlogistine Rub A-535 has been thoroughly tested both clinically and in over 6,000 homes If you would like a tube of Rub A-535, just drop us a line

Now! CHLOROPHYLL* AEROSOL THERAPY

the new advance in the Inhalation Treatment of Respiratory Tract Infections

CHLOROPHYLL AEROSOL THERAPY, as made possible by *Chloresium Aerosol Solution enables the physician to provide the remarkable therapeutic effectiveness of chlorophyll in the inhalation treatment of both upper and lower respiratory tract infections It is the result of intensive laboratory and clinical investigation to meet the long-felt need for an effective nontoxic, healing decongestive, antibacterial and deodorizing agent for use in inhalation therapy

For use with any standard nebulizing equipment

Chloresium Aerosol Solution is a specially processed preparation containing the purified therapeutically active *water-soluble* derivatives of chlorophyll "a" ($C_{55}H_{72}O_5N_4Mg$), designed for use with any standard nebulizing equipment. It is a natural, nontoxic, biotherapeutic agent and may be used either alone or, where indicated, as a solvent vehicle for penicillin or other antibiotic inhalation therapy

A unique combination of advantages

Chloresium Aerosol Solution provides the following unique and fundamental advantages in inhalation therapy

Absolutely nontoxic
Accelerates healing by stimulating normal cell metabolism
Decongests, promptly, without rebound phenomena
Exerts antibacterial effect, particularly on secondary saprophytic, proteolytic invaders
Does not interfere with ciliary activity, tends to restore normal motility if impaired
Can be used freely—especially valuable in the field of pediatrics
Deodorizes fetid, foul-smelling conditions
May be used as solvent vehicle for antibiotic inhalation therapy

Indicated for all respiratory tract infections

The value of Chloresium Aerosol Solution used alone or as vehicle for antibiotics has been demonstrated in the treatment of most infections of the respiratory tract including acute and chronic sinusitis, rhinitis, pharyngitis, ordinary coryza, ozena acute and chronic laryngitis, bronchitis, bronchiectasis, lung abcesses and other deep seated inflammatory conditions

Tyrothricin

Benzocaine

ANTIBIOTIC-ANESTHETIC
THROAT LOZENGES

Tyrothricin, potent antibacterial extract of Dubos' bacillus, and widely considered the topical antibiotic of choice, is the principal ingredient of TYROZETS Lozenges, Sharp & Dohme's remarkable new preparation for prophylaxis and treatment of gram positive throat and mouth infections, and for post-surgical care of the pharynx

Tyrothricin is penetrating, nontoxic when applied locally, and highly effective against such gram positive organisms as Corynebacterium diphtheriae, pneumococci, streptococci and staphylococci frequently responsible for infections of throat and mouth.

Each TYROZETS lozenge contains tyrothricin, 1 mg , and 5 mg of soothing, analgesic benzocaine

TYROZETS Antibiotic-Anesthetic Throat Lozenges rapidly relieve the pain and discomfort of infected or irritated throats, promptly destroying gram-positive pathogens. These new, nontoxic, pleasantly flavored Sharp & Dohme lozenges are indicated for treatment of gram-positive throat and mouth infections, sore throats, and especially following tonsillectomies and pharyngeal surgery They are also effective for prophylactic throat protection when colds are prevalent

TYROZETS Lozenges are packed in neat, shatter-proof, amber plastic tubes of 12

Sharp & Dohme, Philadelphia 1, Pa

SHARP & DOHME **TYROZETS**

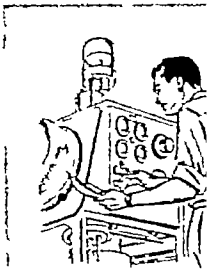
the psychology of a good tonic

For the elderly patient, the benefit of a good tonic is not entirely limited to its tone restoring and appetite stimulating effects

Most physicians know how much the little ritual of taking each pre meal dose of Eskay's Theranates can brighten "the endless, daily, dull routine" of the elderly patient's life

And—of great importance—"his tonic" is an ever present symbol of the reassuring and comforting fact that he is "in the care of his physician"

Smith, Kline & French Laboratories, Philadelphia

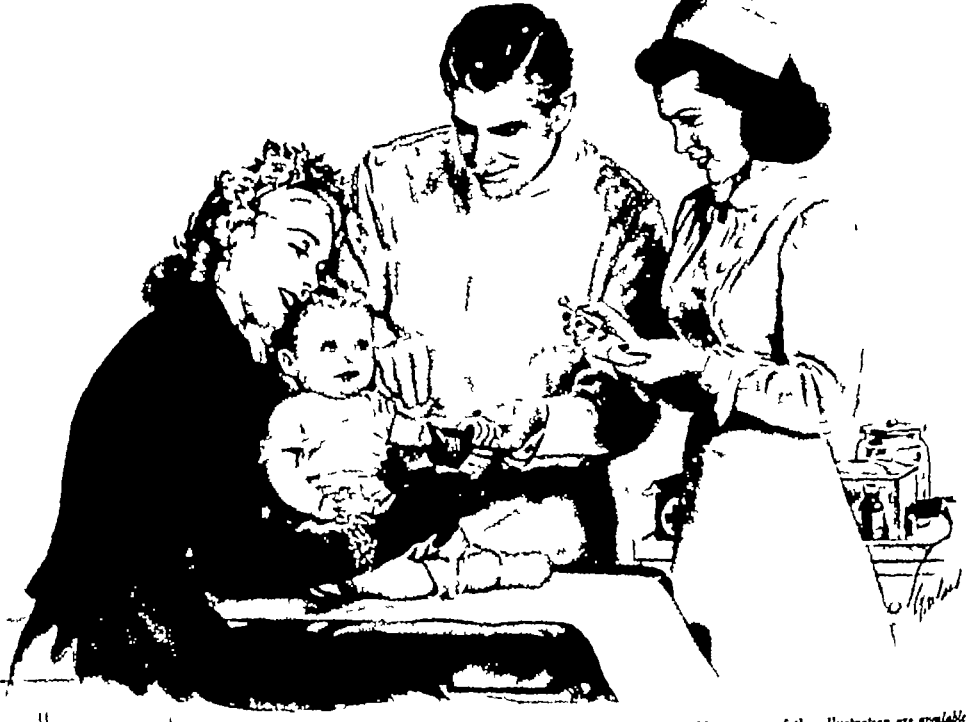


Each adult dose, 2 fluid drams (2 teaspoonfuls) contains	
Alcohol	10 per cent
Vitamin B_1 (thiamine hydrochloride) (250 U.S.P. Units)	0.75 mg.
Strychnine glycerophosphate, anhydrous	1/64 grain
Sodium glycerophosphate	2 grains
Calcium glycerophosphate	2 grains
Phosphoric acid, 75%	1.7 minims

Available in 12 fl. oz. bottles

Eskay's Theranates

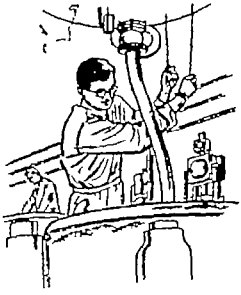
The formula of famous NEURO PHOSPHATES plus VITAMIN B_1



One Pulvule *h.s.*—Tomorrow, Refreshed

When physicians order a bedtime dose of 'Seconal Sodium' (Sodium Propyl-methyl-carbinyl Allyl Barbiturate, Lilly), 1½ grains, for restlessness, they know that during morning rounds they are likely to find a grateful and perhaps more cheerful patient Bedtime sedation with 'Seconal Sodium' encourages wholesome, natural rest Its rapid onset of action carries the patient gently over the threshold of sleep The effect is brief—gone within six to eight hours The patient awakens in the morning strengthened and refreshed from a sound night's rest

'Seconal Sodium' is supplied in ampoules, powder, pulvules, and suppositories Elixir 'Seconal' (Propyl-methyl-carbinyl Allyl Barbituric Acid, Lilly) is also available



Framable reprints of this illustration are available

BENEFACTORS ANONYMOUS

A vaccine is injected into a child's arm The physician, the patient, and the family are confident that a satisfactory immunity will result If a devastating epidemic of the disease in question should occur, the chances are that the patient will not be infected or will experience only a relatively mild attack This faith, of course, is evidence of the trust placed in the biologists, bacteriologists, and technicians who comprise the group of competent specialists responsible for the manufacture of Lilly biological products

An awareness of this faith, together with an inherent desire to improve and perfect the product, characterizes the attitude of the team of experts in this field at the Lilly Research Laboratories Although anonymous to the patient, these experienced specialists have an interest equal to that of the physician in the ultimate result—better health for all through new and improved medicinal preparations

Competition in Publicity

The straightforward aim of the American Medical Association is to tell to the general public the story of progress made in American medicine by a free profession To that purpose the fund raised by the assessment of $25 on each member will be devoted this year The people want and should have facts, they want and should have good medical care.

To disseminate these facts to a people now confused by the efforts of politicians, social planners, and others, including certain small groups of physicians, will demand a supreme effort, an effort to be guided by educational and not pressure tactics in the usual sense People must be told that American medicine has attained its high standards largely by voluntary methods, by the free and unrestricted and unhampered labors of the individual People must be persuaded to believe that voluntary medical care, probably through self insurance, is superior to a politically imposed compulsory system in which bureaucratic control would govern It will not be a simple matter to accomplish this, and the appeal for the necessary funds is justified The source of these funds will be the doctor himself, and the accounting will be an open one, so that all may be aware of the spending program

A press release emanating from a group calling themselves the "Committee for the Nation's Health, Inc," claims to number "among its officers, Russell Davenport, William Green, Bishop Francis J McConnell, Philip Murray, Thomas Addis, M D, Barry Bingham, Morris Llewellyn Cooke, Gerard Swope, David Sarnoff, Mrs Gardner Cowles, Mrs Albert D Lasker, R. M Walls, D.D S, Matthew Woll, Emil Rieve, and Michael M Davis "[1]

The chairman of the group, Dr Channing Frothingham, takes a dim view of the A.M.A 's determination to carry on its own publicity with funds raised by its members He announces in the release that there will be "a grass roots doctors' rebellion" against the American Medical Association plan to raise "a $3,500,000 war chest" He criti-

[1] Release (Dec. 6) 1948

cizes the House of Delegates for "pursuing a course unworthy of the medical profession and repugnant to the ethics of American doctors" One of his arguments is that this body is not representative, that only 5 per cent of its members are under 45 Any one who attends the A M A House of Delegates sessions would be impressed by the activities displayed by these chosen elderly (sic) statesmen

"It is particularly disturbing to note," he says, "that, although many physicians of the A M A 's membership support national health insurance, the proposal to embark on a nation-wide multimillion dollar campaign against it was not made known to the membership in advance of the closed session at which the decision was reached "

We would be grateful to Dr Frothingham for information which we would be glad to pass on to our readers as to the exact methods by which the A M A could tell its members of a decision *before* it had been reached

But now that we know the source of the funds by which the A M A 's educational campaign, unworthy though it be in his opinion, will be carried on, will Dr Channing Frothingham and the "Committee for the Nation's Health" be quite frank and disclose the source of *its* funds, some of which obviously must be used to carry on its Washington office, its New York office, the salaries of its employes and the preparation and mailing of its press releases?

We concede the right to the "Committee for the Nation's Health, Inc ," to set forth its views in any legal manner, as we insist upon the A M A 's right to say its say on the same terms But we do not think that the important question at issue, namely, national compulsory sickness insurance as projected by the new administration vs voluntary health insurance plans as advocated by the A M A in its ten-point program, will be fairly settled in the public interest except on the basis of cold, hard facts Publicity on both sides should adhere to the facts.

Relief Load Rises

Of significance to the medical profession is the news recently reported of the sharp rise in the nation's relief load [1] This information comes from the American Municipal Association and is attributed by that group to inflation, unemployment among unskilled workers displaced by skilled war veterans and movement of many families to other parts of the country, causing temporary emergencies

Says the news report in part

> The number of actual cases has increased 54 per cent in the last three years, from 232,000 to 358,000, while costs have jumped 136 per cent, from $6,600,000 to $15,600,000 a month
>
> Relief cases covered in the survey are general assistance payments to the indigent from the states and localities
>
> However, relief cases and costs still are far behind those in the period just before the war In February, 1940, a total payment of $14,500,000 was made to 1,687,000 families

[1] N Y Times Nov 15 1948 p 28

Why should this increase in relief be of concern to doctors of medicine? Because doctors are also citizen-taxpayers like most everyone else They carry their fair share of the tax load and will naturally be interested in the 136 per cent increase in costs noted above in the last three years

Since the relief cases covered in the survey are "general assistance payments to the indigent from the states and localities," it is logical to assume that the item of medical care would enter little if at all into this picture of general assistance Inflated prices of nearly every item entering into living costs are responsible

During the year, New York showed a 2 2 per cent decrease in case load according to the report, which is not explained However, New York State Labor Department statistics show a net decline since September, 1948, of 1 1 per cent in employment and 4 8 per cent in pay rolls from 2,378 factories in the State This may shortly be reflected

in augmented relief rolls and higher taxes to meet the increased costs

It seems at this writing that substantial increases in the New York State income tax will be necessary, perhaps in addition to a return to the normal 100 per cent tax on incorporated businesses Relief costs, of which the State already pays 80 per cent, are rising, and there may be demand for the State to carry an even larger share of this burden For welfare and education alone, it is estimated an additional 75 million will be required next year, even if the laws covering State aid in such respects remain the same If altered to pay higher percentages, naturally, this figure rises

In a time of inflation such as the present, wage scales or fee schedules mean little as an index of prosperity unless they are realistically related to taxes and living costs, or the costs of doing business Under modern practices of federal and state subsidies to agencies concerned with relief, it becomes difficult to judge the efficiency with which such agencies operate in administering their relief load

This is not to be critical of rising costs of relief to the indigent, but, assuming reasonably efficient management, to use these costs intelligently as an index to forecast the taxpayer's burden in the conduct of big business

For relief to the indigent has become big business Principally it is being administered by government and paid for by the taxpayer Private relief, conducted by nongovernmental agencies but paid for in private contributions by the citizens, is in addition to the tax-supported enterprises, so that anticipated tax increases will not assist but actually diminish citizen-aid

Mass production, be it noted, while it cheapens the cost of *things* if it produces more of them, places at the disposal of citizen-taxpayers and their governments the means to create mass destruction and mass misery This misery, of various kinds, must again be alleviated by relief at the taxpayer's expense so that the costs of this aid should properly be added to production costs in any fair accounting

Doctors who repair the salvageable remnants left behind by the guided or misguided missiles that infest our streets, for example, in increasing numbers, will be in a position to appreciate the prospect for vast increases in the case load of relief to the indigent and the enormous increase in costs of this relief which inflation must necessarily bring in its train

Medicine in the News

As this editorial is being written, nearly every publication daily, weekly, or monthly in the United States is featuring some aspect of medicine This rather overwhelming attention recently and rather suddenly accorded to the profession resembles the blooming of a century plant For the roots of that interest were planted about 1848, in a series of revolutionary movements in Europe

Medicine in its modern science and practice encompasses the growth of all learning in the natural sciences, in sociology, economics, and manufacturing, and is a crossroads of historic movements developing and gathering momentum through the last century

Progress in healing has always been newsworthy because it offered hope for millions of sufferers and was pledged to the conquest of death itself The spirit of liberalism has been and is the guiding genius of the medical profession and has pervaded its science and practice wherever the profession has been unchained and free to develop The comparatively isolated position of the United States, together with its political philosophy, has secured for the medical profession here a longer guarantee of freedom than most other regions of the earth This, too, is newsworthy, the more so as, one after the other, the nations of Europe have succumbed to various forms of state socialism

At this writing the American Medical Association has announced an assessment upon each member of $25 to raise a sum of approximately $3,500,000 This also is newsworthy But the urgent need to raise this sum is even more newsworthy

The revolutionary tide of 1848, having rolled over Europe, is now lapping at the shores of this continent This should be newsworthy and in fact is so recognized [1 2] Called by various names and tagged with assorted political labels, it is the same national socialism that has engulfed and captured the formerly free medical profession in all the countries of Europe In England, national health insurance immediately preceded the nationalization of medicine and the Bank of England That also was newsworthy but remote

Now, national health insurance is proposed for this country, with nationalization of the services of the medical profession here soon to follow through the medium of compulsory sickness insurance The people of the country should be informed of what goes on It is the intention of the A M A to do this Your contribution or assessment is to be devoted to this purpose

Current Editorial Comment

Combined Ventral and Lateral Pyramidotomy in the Treatment of Paralysis Agitans It has been suggested by Bucy that tremor is transmitted from the Betz cells of area 4γ through the large fibers of the pyramidal tracts This is based on his own experiences with excision of area 4γ, and those of Putnam in section of the lateral pyramidal tract, in the upper cervical region of the spinal cord, in cases of paralysis agitans However, lateral pyramidotomy does not interrupt all of the fibers arising from the large Betz cells of area 4γ, as the ventral and ventrolateral pyramidal tracts remain intact Because of the peculiarities of pyramidal tract decussation, complete interruption in the upper cervical cord of all pyramidal tract impulses to one side would entail section of the ipsilateral lateral tract and the contralateral ventral and ventrolateral tracts

A technic has been devised by Dr Judah Ebin to perform this through a single cord incision which crosses the midline, a technic which was presented in a paper at a recent meeting of the New York Academy of Medicine This procedure, a combined ventral and lateral pyramidotomy, has been used in 11 cases of paralysis agitans presenting unilateral or bilateral tremor and/or rigidity with almost complete disappearance of tremor and rigidity on the operated side Motor power returns, on the average, to approximately 35 to 40 per cent of normal In one case with bilateral symptoms, the procedure was done bilaterally with an excellent result Reports on further applications of this procedure will be awaited with interest

The Course Outline Book Just previous to the lamented death of the late Dr Oliver Wendell Holmes Mitchell, chairman of the Council Committee on Public Health and Education of the State Society, there was issued from his committee a *Course Outline Book* In this comprehensive pamphlet of almost 100 pages there is presented a program for lectures and demonstrations, including practically all branches of medicine and surgery, available to the county societies of the State The contributors are outstanding clinicians and teachers who have agreed to give these lectures on request, and this represents a noteworthy effort by the State Society to bring the advances in medical knowledge to every community of physicians who may desire to participate The booklet is a monument to the labor of Dr Mitchell and his associates, for which the Society should be most grateful

A Legislative Manual Under the above title, an important communication has been addressed to the chairmen and members of the legislative committees of the constituent county societies The importance of developing and maintaining an active interest in legislative matters should not be limited to these special committees The membership at large should keep itself informed about proposed legislation which affects its interests The work of the county societies' committees will be stimulated by an evidence of such interest

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

The Special Roles of Fat in the Diet

Fats have two and a quarter times the caloric value of carbohydrates and thus provide a condensed source of energy which is particularly needed for hard work They also add palatability and a satiety value to the diet, factors which are of large importance in food acceptance, as wartime and postwar European experience has demonstrated In addition, there are certain specific compounds in the fat molecule which have essential functions in nutrition

The Essential Fatty Acids

The fatty acids which have come to be recognized as dietary essentials are unsaturated acids of high molecular weight—linoleic and arachidonic The recognition of their essentiality dates from 1929 when Burr and Burr demonstrated that rats fed a diet almost devoid of fat developed a scaly condition of the skin, failed to grow normally, and eventually died [1] Certain derangements of kidney function and disturbances of reproduction were also noted in the affected animals The unsaturated acids were established as the responsible deficiencies in the fat-free diet on the basis of their effectiveness in preventing or curing the specific troubles produced in their absence It became recognized that the acids in question were dietary essentials because they could not be synthesized in the body, in contrast to oleic and the many others which make up body fats It also became evident, however, that both acids were not needed together, apparently because one can be synthesized from another Either linoleic or arachidonic acid alone cured the skin symptoms and caused resumption of growth

In extending the studies to other species, puppies reared on low-fat diets were found to develop a scaly skin curable by the ingestion of a fat high in linoleic acid Attempts to produce this condition in pigs, however, have resulted in failure Similarly, no deficiency symptoms were noted by Brown and coworkers in one human subject kept on a nearly fat-free diet for six months [2]

Of special interest to physicians are the studies which have been made of the possible usefulness of fats containing the essential fatty acids in the treatment of eczema Hansen noted that the blood serum of human subjects suffering from eczema was lower than normal in unsaturated fat, corresponding to previous observation with rats [3 4] They reported improvement when eczematous infants were given oils containing the essential acids

Hansen's initial report stimulated a number of others to try oils rich in unsaturated acids for the treatment of eczema, with varying results Cornbleet reported favorable effects with corn oil on chronic eczema which previously had resisted treatment [5] Finnerud and associates reported clinical improvement in the majority of 18 hospitalized patients, none being considered cured, however [6]

On the other hand, Epstein and Glick reported no benefit from the use of linseed oil, except in one case out of 34 [7] While Ginsberg and Bernstein noted improvement in a few of 17 patients from feeding codliver oil or corn oil, they concluded that there was no reason to believe any specific benefit resulted from feeding oils rich in the highly unsaturated acids [8] Taub and Lakon from a study with eight patients concluded that the use of linseed oil as recommended by Hansen was entirely unjustified and not without danger in patients who might be sensitive

to it [9] The most extensive study, however, has recently been published by Hansen and associates [10] In observations on 148 eczematous patients of various ages, addition to the diet of lard and certain vegetable oils rich in the unsaturated fatty acids produced a clinical response judged to be "good to excellent" in 60 cases, "fair to good" in 51, and "slight or nil" in 37

From a consideration of the reports as a whole, it appears that the ingestion of the essential fatty acids may have a beneficial effect on eczema in the case of certain individuals, when used along with good local and general therapy, including the elimination from the diet of all foods to which the patient is known to be sensitive As Hansen and associates stress in their article, the ingestion of fats rich in the specific acids should be considered adjunct to and not a substitute for other measures [10]

It should be noted that, except in the case of rats, the reported benefits have been obtained with fats rich in the unsaturated acids and not with the acids per se Thus, some other constituent besides the acids may possibly be concerned

The normal human diet should not be deficient in these acids If man's need is proportional to that of the rat, an intake of 1 per cent of the total calories should suffice Considering the wide distribution of these acids in animal and vegetable fats which make up our daily diets, a deficiency where absorption is normal seems highly improbable Whether any beneficial effect on eczema results because the patient's intake was previously deficient, or whether failure of normal absorption is involved is unknown

Animal vs Vegetable Fats

Much research has centered around the question as to whether animal fats are nutritionally superior to vegetable fats, as a class This research has been stimulated largely by the butter-oleomargarine controversy, and many papers have been published accordingly This question was very carefully reviewed by a special committee of the Food and Nutrition Board with the following conclusion "The present available scientific evidence indicates that when fortified (vitamin A) margarine is used in place of butter as a source of fat in a mixed diet, no nutritional differences can be observed" [11] Since the above report was issued, further evidence has confirmed the conclusion reached It now seems clear that butter and fortified oleomargarine are nutritionally equal for all practical purposes in the human diet

A special value for butter because of its content of an unusual fatty acid, vaccenic acid, was suggested by a report by Boer *et al*, in 1947 [12] These workers published evidence that summer butter has a special effect on rat growth because of its content of this acid Later studies by others have failed to confirm these findings It is also apparent that vaccenic acid occurs in other fats, both animal and vegetable

Butter is superior to other fats because of its vitamin A value, unless this vitamin is added to the other fats This superiority does not hold for any other animal fat The essential fatty acids are to be found in both animal and vegetable fats Lecithin, which provides the choline essential for fat transport by means of phosphorylation, is present in both Thus, all the evidence indicates that, as a class, the two sources of fat are nutritionally alike

VALUE OF SUPPLEMENTARY PROTEIN FEEDING IN AGED AND CHRONICALLY INFECTED ORTHOPEDIC PATIENTS

A DELLA PIETRA, M D , New York City

(*From the Orthopedic Service of St Luke's Hospital*)

NO ORTHOPEDIC surgeon will find it difficult to recall to his memory a case such as the following

A seventy-three-year-old patient with injured hip is admitted Roentgenographic examination reveals a displaced fracture of the neck of the femur The laboratory reports mild anemia with normal urine analysis and blood chemistry The fractured hip is nailed without difficulty, and the patient is returned to the ward in a satisfactory condition The immediate postoperative course is uneventful In a few days the nurse reports beginning sacral skin necrosis Shortly thereafter, the patient's appetite is noted to be poor Fluid intake is low, and the patient appears apathetic

Within two weeks the patient becomes confused and incontinence of urine and feces is present There is a slight elevation of temperature and the decubital ulcer becomes larger Pressure sores develop at the elbows and elsewhere Despite most careful nursing, a steady downhill course results Wasting becomes evident, daily rises in temperature occur, and loss of bladder and bowel control is complete The pulse rate rises, rales are heard in both lung fields Quietly, slowly, undramatically, the temperature rises to 104 F Respirations are increased, and the pulse becomes weak and thready Death ensues in spite of conservative or heroic measures Autopsy is obtained The pathologist reports a body appearing older than the stated age with a healed operative incision, decubital ulcers at weight-bearing areas, generalized arteriosclerosis and heart disease, bilateral bronchopneumonia, and malnutrition

Fortunately, this sequence of events can be made rare by constant awareness of the effects of malnutrition, avitaminosis, and the altered metabolism of the injured patient Only by the attending surgeon's refusal to accept the inevitability of such indefinite symptoms can the sequence of events be reversed Many lines of investigation have been stimulated to find the plausible explanation of this clinical picture In this, as in so many other problems present in medicine and surgery, an answer may be found by careful analysis of a single thought, or, indeed, a single word

The word protein, derived from the Greek word meaning first (or, freely translated, "of first importance"), has drawn the attention of many investigators Strangely enough, not many investigators of orthopedic problems have been concerned with it Research workers studying protein have been directly interested in wound healing, nitrogen balance, fluid balance, salt balance, nutrition, blood clotting, and its many associated problems Protein investigation has been extensive as related to local edema, generalized edema, pulmonary edema, nephrotic states, the problems of immunity, the hepatorenal syndrome, sepsis, the hormones, the enzymes, liver function, and the protective role of the liver to toxins It has even been extended to the synthesis of prothrombin and the poor response of patients to trauma, operations, and anesthesia The basic physiologic relation of the proteins to all these problems has been presented by many authors With relation to the direct problems or the orthopedic surgeon, in 1919, Clark, working with dogs, showed that the lag phase in wound healing was markedly shortened with high protein diet [1] Howes and McKeown in 1934 pointed out the relationship of high protein intake to bone healing with specific favorable influence of rate and firmness of callus formation in animals on a high protein diet [2] Cuthbertson in 1936 pointed out the remarkable loss of proteins in the urine following fractures [3–5] A decreased formation of callus in hypoproteinemic dogs was reported by Rhoads and Kasinskas in 1942 [6] More recently,

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Orthopedic Surgery May 20 1948

Barr and his coworkers at Cornell observed and reported a marked negative protein balance present in presumably normal patients confined to bed Best and Taylor in discussing calcium balance state that protein foods tend to increase the absorption of calcium since the latter forms soluble complexes with certain amino acids [7] Albright has postulated that the adrenal gland produces an "N," or protein anabolic hormone, and an "S," or sugar anti-anabolic hormone, and that normally these are balanced [8] After injury, there may be decreased excretion of "N" and an increased excretion of "S" hormone, producing an increased catabolism of protein. More recently, the events of the war have led to the realization of the massive loss of protein associated with fractures of the femur, so much so that many authors refer to this phenomenon as a "toxic" loss of protein

The pressure of these events forced us to consideration of the nutritional state of patients on the orthopedic service at St Luke's Hospital The essential nutrition of an aged patient with a fractured hip, an aseptic necrosis of the head of the femur, a nonunion of a fractured neck of the femur, or a fractured femoral shaft is far beyond treatment with vitamins or the so-called "regular diet" A patient convalescing from a hip fusion or patients with chronic osteomyelitis with draining sinuses in need of massive saucerization, bone-grafting, pedicle skin-grafting, etc , always demand accurate estimation of protein status and specific reinforcement of dietary proteins

A so-called "regular diet," so blandly and casually ordered in routine fashion, when closely scrutinized, reveals many deficiencies, not only in itself but also in the way it is received by the individual patients A *thirty-day survey* of 32 unselected patients revealed that half the patients ate 70 per cent of their diet, a quarter of them ate 50 per cent of this diet, and the remaining quarter ate only 15 to 30 per cent The average patient was receiving 50 per cent of the diet, or only 35 Gm of protein daily Together with this fact was combined the observation that routine initial total protein blood levels were 5 1 to 5 6 mg per cent These facts led us to realize that highly technical tests were unnecessary to establish the presence of low protein intake and the marked deficiency of the so-called "regular diet"

Recognition of protein deficiency is not discernible by clinical observation alone A simple clinical or laboratory test to determine such a deficiency is not available Complete nutrition study at the present time includes a nitrogen balance study (which indicates the metabolism of the whole protein), an amino acid balance study (which follows the fate of single amino acids), plus blood volume determinations, total circulating protein determinations, and determination of the available fluid space, which gives some indication of the amount of *interstitial fluid* in the body More recently, Locallo *et al* have advocated that the estimation of the protein concentration of the patient's fascia be used as a means of ascertaining the state of protein nutrition and protein level of the tissues [9] The very existence of these various tests points out the complexities of the problem of accurately determining the nutritional state of the patient

The above scientific investigation is obviously impossible on a mass of clinical material In our patients the laboratory investigation was limited to total protein blood level, albumin-globulin ratios, and blood hemoglobin levels One must note that a low plasma protein and a low albumin-globulin ratio are strong indicators of protein deficiencies This basic laboratory work was done on our patients and definite observation of the average patient's diet and actual daily protein intake made It was realized from numerous reports that intravenous supplementary protein feeding is unsatisfactory Steps were taken, therefore, to increase the oral protein intake of our patients If one is not aware of the extreme difficulty in accomplishing this, he will shortly realize that cooperation, not only from the patient but also from the nurse in charge, the dietitians, the house officers, and the attending surgeons, is *absolutely necessary* At *first*, increased protein feedings were provided by the use of additional eggs, eggnogs, albumin water, and increased meat portions This was accepted neither quickly nor without difficulty by the patients as a group Some patients did not want an increased number of eggs Others did not take to eggnogs, and still others complained that they could not eat such quantities of meat The appearance of actual indigestion, biliousness, diarrhea, and abdominal cramps, while not generally present at any one time, were noted in isolated cases With constant attention, supervision, variation in diet, and emphasis to the patient of the importance of an adequate diet, much was and can be accomplished Yet, it cannot be stated too vehemently that the clinical impression that patients are on a high protein diet and getting a massive quantity of protein is, in many cases, erroneous Actual eating of the diet must be observed by the nurse or dietitian The food trays must be checked for amount of food consumed, and records must be kept and evaluated by trained dietitians In all our cases, such records were kept on the daily intake in grams of carbohydrates, proteins, fats, and the total calories actually eaten by such patient This routine showed very strikingly that the writing of an order for a high protein diet and the serving of a

high protein diet to the patient did not mean that the patients were actually providing themselves with 100 to 150 Gm of protein daily

In fact, analysis of these records showed that during any one week patients would vary their intake from a low of 35 Gm of protein daily to a high of 160 Gm. The caloric intake in the same patient would vary from a low of 1,215 total calories a day to a high of 3,325 calories The most striking fact, discovered upon close observation of the dietary habits of these patients, was that the majority of them, thought to be on a regular diet, were actually eating only 35 to 50 Gm. of protein daily In most cases the comparison of the resident's impression of the food intake of the patient with the actual amount of food consumed was completely erroneous Moreover, this study revealed that those caring for a group of patients would be cognizant of the patient's diagnosis, roentgenographic findings, number of days in bed, temperature, pulse and respiration, fluid intake and output, and clinical and laboratory facts (commonly accepted as important), yet no one knew exactly the amount of food the individual patients were consuming We cannot emphasize too strongly the need for directing attention to the actual food eaten by the aged and chronically infected orthopedic patient Interest and concern must be directed to more than the mere ordering of a regular diet, a high protein diet, or whatever the so-called routine may be The food actually eaten must be known so that the vicious cycle of loss of strength, lassitude, anorexia, depletion of tissue proteins, loss of weight, and all its consequent hazards will not bring the patient to a low level of asthenia

Following a period in which patients were maintained on high protein feedings as mentioned above, other steps were taken to assure patients of a high protein intake, namely, the use of a supplementary protein The product used was Protinal * The powdered product is palatable and capable of producing the same clinical and laboratory response as was noted with supplementary protein foods

There were 32 patients studied in this series These patients were closely followed as to daily carbohydrate, protein, and fat intake A minimum of 100 Gm. of protein daily (and a maximum of 150 Gm) were provided by diet and supplementary protein feedings Six to eight tablespoons of Protinal were taken daily by the patients in addition to their regular food (70 Gm of protein) One hundred twenty grams of protein a day were therefore provided Blood protein levels and albumin-globulin ratios were done weekly Blood hemoglobin levels were done as indicated The weights of the patients were checked on admission and at time of discharge from the hospital

For the sake of analysis, these patients will be presented in two groups Group I included the aged patients with fractured necks of the femur, intertrochanteric fractures, and nonunion of fracture of the neck of the femur Group II were those with gross infections of nonunited tibiae and femora

There were 15 patients in Group I The average age on admission was sixty-seven years, and their average blood hemoglobin was 84 per cent On discharge the average blood hemoglobin was 93 per cent Average total blood protein on admission was 5 7, and on discharge it was 6 8 These 15 patients are still being seen in follow-up clinic, and, while it is too early to comment on the results of the various orthopedic problems, their postoperative course and convalescent periods were strikingly uneventful It is well to mention at this time that a consideration of the complete response of the patient cannot be attributed to the benefits of adequate diet alone These people had the benefit of excellent anesthesia, together with well worked out surgical procedures, antibiotics when indicated, careful supervision of fluid balance, vitamin therapy, and transfusion at operation when indicated The point is made, however, that protein therapy was considered a most important part of postoperative care Two typical cases of the first group are reported

Case Reports

Case 1—E L, a sixty-one-year-old Russian woman, was admitted following a fall at home twenty-four hours prior to admission. Roentgenograms revealed an intracapsular fracture of the right femur On admission, the total blood protein level was 5 1 mg per 100 cc and the hemoglobin was 81 per cent She also had severe rheumatoid arthritis which had been treated in the arthritic clinic for a period of fourteen months Within twenty-four hours an internal fixation was done, and she was placed on supplementary protein feedings which were accepted poorly at first. With continued efforts her protein intake level was raised In three weeks she was permitted up and about with crutches and brace She complained of pain in the affected hip and roentgenograms revealed that the three-flange nail had displaced in the femoral head (Fig 1) A hexagonal osteotomy was immediately done, and skeletal traction maintained for six weeks The blood protein level rose from 5 1 to 6 1, and the hemoglobin increased from 78 per cent to 87 per cent The patient had gained nine pounds when dis-

* Provided for this study by the National Drug Company Protinal is a whole protein-carbohydrate preparation possessing high nutritive value and containing 70 per cent of an effective intact protein with all of the essential and non essential amino acids and an adequate carbohydrate content. Each 30 Gm. contain 18 4 Gm. of protein derived from milk, with .2 Gm of carbohydrate.

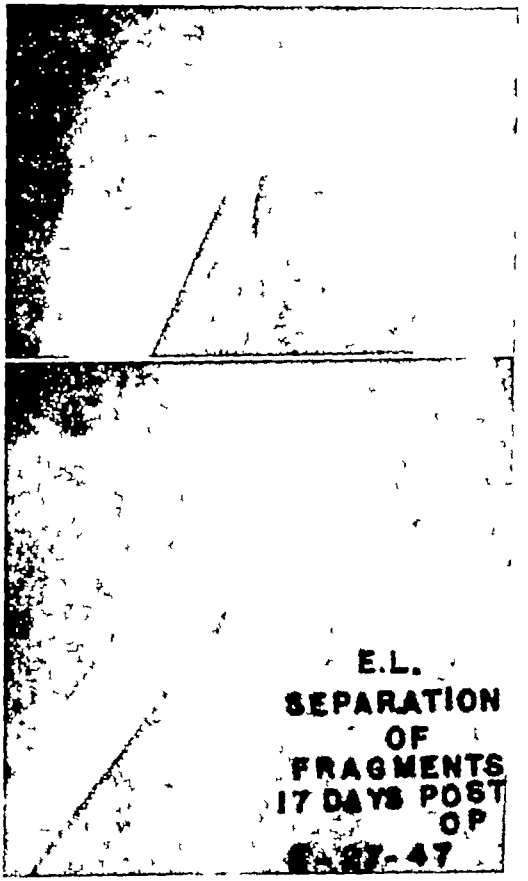

FIG 1 Roentgenograms on February 27, 1947, revealing displaced three-flange nail out of femoral head (Case 1)

charged on July 12, 1947 Rapid healing of the osteotomy site was noted, and when last seen in follow-up clinic, the intracapsular fracture was healed (Fig 2) During all this time, despite her age, fracture, bed confinement, and two operations, the general condition continued to improve

Case 2—E P, a fifty-year-old white woman, was admitted February 16, 1947, with a pathologic subtrochanteric fracture of the right femur Two years prior to admission, the patient had been treated on the medical service for chronic alcoholism, pernicious anemia, and tertiary syphilis Ten days after admission, a Jewett nailing of the right femur was done She was in traction eight weeks, and then a brace was used Three and one-half months after the fracture, while moving in bed, she refractured her femur and broke the nail A second nailing with bone grafts was done, and she was kept in a brace in bed for a full five-month period On December 12, 1947, after being out of the hospital two days, she had recurrence of pain in the right hip Roentgenograms revealed a second refracture of the femur and the nail An osteotomy was done with steel plate and additional bone grafts At present she is still hospitalized and in traction This patient's protein blood level was 5 8 on admission and now ranges between 7 2 and 7 4 Hemoglobin was 90 per cent at first and is now 102 per cent. During her initial stay of approximately ten months in the hospital she gained 28 pounds This patient had a fractured hip, two refractures, three severe hip operations, a year in bed, and yet her general basic condition has been steadily improved

The second group of patients studied represents that group with compound fractures of the femur or tibia complicated by osteomyelitis of long duration The three following cases are representative of this group

Case 3—M P, a forty-three-year-old white woman, was admitted to St Luke's Hospital on May 11, 1946, with a history of falling under a subway train seven months prior to admission She had sustained multiple injuries and a compound fracture of the left femur On admission she had a nonunion of the left femur with draining sinuses Four operative procedures were performed as follows Immediate removal of plate and screws, six months later, decortication and sequestrectomy of the shaft of the femur, seven months postadmission, iliac strip grafting of the still draining femur through fresh incision, and eighteen months postadmission, incision and drainage of an abscess of thigh During most of the hospital stay Staphylococcus aureus hemolyticus was cultured from draining sinuses from the thigh which eventually healed On admission the patient had nonunion infected femur, a hemoglobin of 94 per cent, total protein of 6 9, and weighed 121 pounds. On discharge she had a solid healed femur, a hemoglobin of 96 per cent, total protein averaging 8 1, and had gained 28 pounds

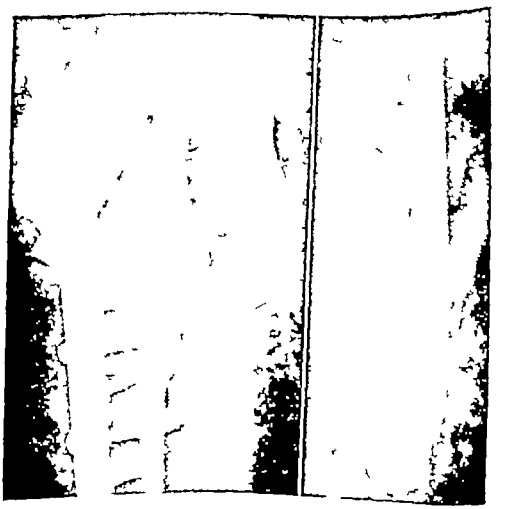

FIG 2 Roentgenograms on January 13, 1948, almost one year after hexagonal osteotomy, showing healed intracapsular fracture (Case 1)

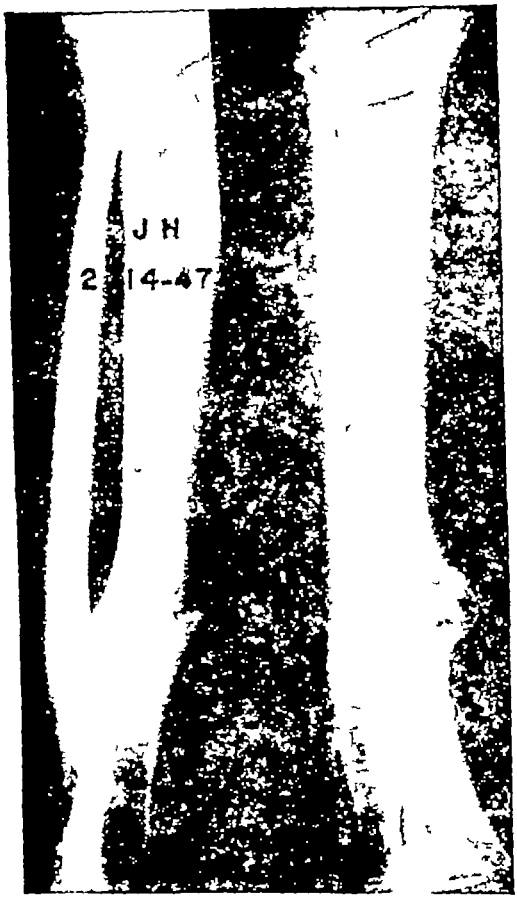

FIG 3 Roentgenograms on February 14, 1947, of an old compounded infected nonunion left tibia (Case 4)

Case 4—J H, a forty-five-year-old white man, was admitted to St Luke's Hospital on February 13, 1947, giving a history of a compound fracture of the left tibia in 1931 (Fig 3) In 1933 there had been grafting of the tibia In 1934 this was followed by sequestrectomy Transplantation of the fibula to the tibia had been done without avail. The lower extremity was asymptomatic (but with nonunion of the tibia) until 1942 when a draining sinus appeared and was untreated for five years Following admission to St Luke's, saucerization of the tibia was done which was followed by a split thickness graft one month later Three months after admission there was implantation of iliac chip grafts and plastic skin closure Union occurred despite incomplete skin healing He was discharged six months after admission with minimal drainage from the tibia He had gained 27 pounds in weight while on the service and on discharge had a hemoglobin of 98 per cent and a total blood protein of 7 4, as compared to an admission hemoglobin of 80 per cent and an initial blood protein of 6 1 Follow-up roentgenogram, taken on February 11, 1948, is shown in Fig 4

Case 5—J L, a fifty-one-year-old white man, was admitted to the orthopedic service on March 10, 1947 On admission this patient had a compounded nonunion of the left femur sustained one year before There was minimal drainage from the thigh Manipulation was done for severe angulation, and four months later, through a posterior approach iliac strip bone grafts were placed about the site of nonunion One month later, incision and drainage of the thigh was necessary Two weeks following his bone-grafting, drainage occurred at the operative site. Staphylococcus aureus hemolyticus was cultured. He was maintained on penicillin throughout, despite marked resistance of the organism cultured, to prevent secondary infection with other organisms This patient went on to complete healing with the actual take of the iliac grafts at the infected site of the femur On admission he had a hemoglobin of 84 per cent, a total blood protein of 6.2 per cent. At time of discharge on April 28, 1948, he had a hemoglobin of 96 per cent, a total blood protein of 7 1 per cent and had gained 6 pounds in weight

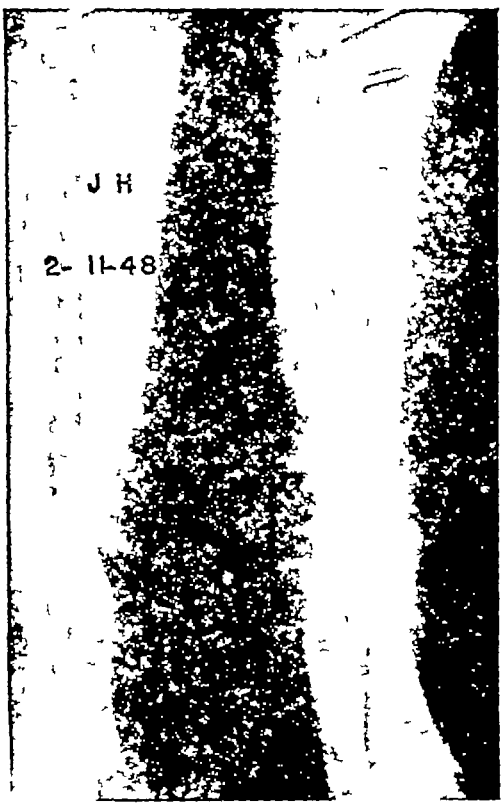

FIG 4 Roentgenograms on February 11, 1948, showing healing with union and absence of infection (Case 4)

The three patients mentioned above are representative of a group of patients which are notorious for poor wound healing and poor bone-grafting results The maintenance of high protein intake is not the sole factor in the care of these patients but is considered of critical importance to their healing All three of these patients at the present time are healed, with no evidence of infection, and the reconstructive procedures were completed in spite of the presence of gross infection

We have, in the past, seen a group of patients with generalized decalcification of the spine, multiple compression fractures of the vertebral bodies, and lassitude and marked asthenia, which have responded poorly to treatment A small number of these patients have been placed on high protein diets, both with and without androgenic and estrogenic therapy It is too early as yet to state any definite opinion, but our impression is that the general well-being and symptoms of these patients are vastly improved by a high protein diet

onclusions

1 Aged, injured, infected, or bedridden orthopedic patients, if left to themselves, tend to assume a negative protein balance, even if offered an adequate diet

2 Positive protein balance can be provided by ingestion of 100 to 150 Gm of food protein or by the less expensive and more positive means of "medication" with a supplementary protein product such as Protinal The regular hospital diet (70 Gm of protein) is too low for adequate maintenance

3 To secure results, a record of definite ingestion of protein provided must be maintained, and difficulty in initiating such ingestion is often encountered

4 Positive protein balance is reflected by rise in blood protein, hemoglobin, and body weight

5 Positive protein balance has shown benefit in maintaining integument integrity, promoting bone healing processes, controlling old osteolytic infections, and reversing debilitating processes of the injured aged

6 Supplementary protein therapy avoids detrimental obesity incident to fat and carbohydrate intake accompanying protein in high caloric diets

BLOOD DERIVATIVES IMPORTANT FOR MEDICINE, RESEARCH

Writing in the November 20 issue of the *Journal of the American Medical Association*, Charles A Janeway, M D , from the department of pediatrics, Harvard Medical School, and the Children's Medical Center, Boston, reports that breaking up blood into specific components also effects a great economy in using blood donations

Because a function of the blood is concentrated in each fraction, donations which in the form of whole blood could be used to treat only 20 patients can be used as blood derivatives to treat over 200 patients, he points out,

Another important consideration, Dr Janeway says, is that many of the blood components undergo rapid deterioration in whole blood Separated and concentrated, each may be packaged in a state best adapted to the preservation of its functional activity, ready for clinical use when and where it is needed

During the Army-Navy-Red Cross blood program of World War II, slightly more than two million blood donations were subjected to fractionation, yielding products which were used in part by the armed forces Surplus products were returned to the American people

BLOOD DERIVATIVES IMPORTANT FOR MEDICINE, RESEARCH

Writing in the November 20 issue of the *Journal of the American Medical Association*, Charles A. Janeway, M D , from the department of pediatrics, Harvard Medical School, and the Children's Medical Center, Boston, reports that breaking up blood into specific components also effects a great economy in using blood donations.

Because a function of the blood is concentrated in each fraction, donations which in the form of whole blood could be used to treat only 20 patients can be used as blood derivatives to treat over 200 patients, he points out.

Another important consideration, Dr Janeway says, is that many of the blood components undergo rapid deterioration in whole blood. Separated and concentrated, each may be packaged in a state best adapted to the preservation of its functional activity, ready for clinical use when and where it is needed.

During the Army-Navy-Red Cross blood program of World War II, slightly more than two million blood donations were subjected to fractionation, yielding products which were used in part by the armed forces Surplus products were returned to the American people

order to disclose any possible antecedent episodes of trauma to the genitalia, venereal disease, or childhood illnesses, such as mumps and scarlet fever, which are sometimes provocative of orchitis and epididymitis. An extensive sexual history is carefully checked and investigated, this must, of course, include detailed information about prepubertal sexual experiences, advent of puberty (delayed in hypo-orchidism and eunuchoidism), and premarital relationships The current marital status is then thoroughly explored with specific reference to frequency of intercourse, extramarital associations, and any possible emotional or physical incompatibility with the mate It is not uncommon for a patient to have normal intercourse extramaritally and yet be impotent with his own wife Questions concerning abnormal sexual practices (coitus interruptus, perversions, etc) are imperative The social background of the patient is determined as well as his occupation and economic status with a view to uncovering any relationship to his complaint Drug addiction and alcohol indulgence are important considerations Although alcohol will cause a retardation of spermatogenic elements, only in exceptionally large doses over a long period of time will it have an effect on potency The hereditary history is investigated in order to ascertain any possible hereditary disposition to sexual weakness A routine functional inquiry is made to bring to light any abnormalities in any of the systems which may have a bearing on the patient's complaint

Physical examination must of necessity be thorough and complete. Special note is made of the distribution of fat and hair, as well as genital abnormalities Scrotal contents, perineum, and prostate are accorded special care In every instance microscopic examination of the prostatevesicular secretion is performed. Where indicated, extensive laboratory data are procured to indicate infectious disorder or metabolic or endocrinologic dysfunction. Thus, delayed epiphyseal closure is revealed by x-rays of the long bones when hypogonadism is associated with anterior pituitary disturbance Seminal secretions may be examined as a supplementary test, since, occasionally, hypofunction of the testicles is associated with finding inactive and decreased numbers of sperm. Cystoscopy is frequently performed to discover any pathology in the posterior urethra, such as polyps, cysts, or chronic inflammatory changes In rare instances seminal catheterization and vesiculography are considered important

Treatment

The treatment of impotence depends upon establishing a proper diagnosis as to its cause. Surgical therapy is rarely required and is usually confined to those cases in which there is a congenital abnormality The following defects fall into this category (1) extreme epispadias or hypospadias, (2) trauma of the perineum by accident or operation, (3) inflammatory lesions of the perineum due to excessive scar formation, (4) certain cases of advanced age with loss of tone of perineal muscles (5) conditions preventing erection such as concealed penis, where the copulatory organ has grown into the scrotum, (6) congenital strictures, (7) gangrene of the penis followed by impotence where the slough has been replaced by scar tissue, and (8) injuries to erectile tissue such as fractures of the penis

Various operative procedures have been used in order to control erection One is ligation of the deep dorsal vein of the penis The theory underlying this procedure is to prevent the too rapid egress of the blood from the penis so that a more rigid erection will be obtained Another surgical procedure is that of Steinach where the vasa deferentia are tied off in order to increase the number of interstitial cells with a consequent increase in hormonal secretion. Results with this type of procedure have not been altogether satisfactory according to the majority of reports Another method to obtain a more satisfactory erection is that introduced by Lowsley, who plicates the bulbocavernosus muscle and the ischiocavernosus muscle which allows greater compressibility of the veins leading from the penis and, therefore, a better erection can be obtained The group of cases that can be treated surgically, however, is comparatively small Polyps and other growths of the posterior urethra may be treated surgically by cauterization through the cystoscope

In discussing therapy for impotence due to congestion of the posterior urethra prostate, and seminal vesicles, in which there is a catarrhal inflammation of this area, the treatment consciously or unconsciously has been directed toward relieving irritation of the peripheral nerve endings of this area which are constantly sending impulses to the central nervous system Our theory is that premature ejaculations and final loss of sexual desire are part and parcel of the same process With excess stimulation due to the catarrhal inflammation present, one would expect a hypersensitivity of the nerve endings with consequent premature ejaculation. As this stimulation continues, the nerve centers in the spinal cord either become fatigued due to the continuous stimulation or, because of the constant inflammatory condition about them, become damaged, with the result that impulses

order to disclose any possible antecedent episodes of trauma to the genitalia, venereal disease, or childhood illnesses, such as mumps and scarlet fever, which are sometimes provocative of orchitis and epididymitis. An extensive sexual history is carefully checked and investigated, this must, of course, include detailed information about prepubertal sexual experiences, advent of puberty (delayed in hypo-orchidism and eunuchoidism), and premarital relationships The current marital status is then thoroughly explored with specific reference to frequency of intercourse, extramarital associations, and any possible emotional or physical incompatibility with the mate It is not uncommon for a patient to have normal intercourse extramaritally and yet be impotent with his own wife Questions concerning abnormal sexual practices (coitus interruptus, perversions, etc) are imperative The social background of the patient is determined as well as his occupation and economic status with a view to uncovering any relationship to his complaint Drug addiction and alcohol indulgence are important considerations Although alcohol will cause a retardation of spermatogenic elements, only in exceptionally large doses over a long period of time will it have an effect on potency The hereditary history is investigated in order to ascertain any possible hereditary disposition to sexual weakness A routine functional inquiry is made to bring to light any abnormalities in any of the systems which may have a bearing on the patient's complaint

Treatment

The treatment of impotence depends upon establishing a proper diagnosis as to its cause Surgical therapy is rarely required and is usually confined to those cases in which there is a congenital abnormality The following defects fall into this category (1) extreme epispadias or hypospadias, (2) trauma of the perineum by accident or operation, (3) inflammatory lesions of the perineum due to excessive scar formation, (4) certain cases of advanced age with loss of tone of perineal muscles, (5) conditions preventing erection such as concealed penis, where the copulatory organ has grown into the scrotum, (6) congenital strictures, (7) gangrene of the penis followed by impotence where the slough has been replaced by scar tissue, and (8) injuries to erectile tissue such as fractures of the penis

Various operative procedures have been used in order to control erection. One is ligation of the deep dorsal vein of the penis The theory underlying this procedure is to prevent the too rapid egress of the blood from the penis so that a more rigid erection will be obtained Another surgical procedure is that of Steinach where the vasa deferentia are tied off in order to increase the number of interstitial cells with a consequent increase in hormonal secretion. Results with this type of procedure have not been altogether satisfactory according to the majority of reports Another method to obtain a more satisfactory erection is that introduced by Lowsley, who plicates the bulbocavernosus muscle and the ischiocavernosus muscle which allows greater compressibility of the veins leading from the penis and, therefore, a better erection can be obtained [7] The group of cases that can be treated surgically, however, is comparatively small Polyps and other growths of the posterior urethra may be treated surgically by cauterization through the cystoscope

In discussing therapy for impotence due to congestion of the posterior urethra, prostate, and seminal vesicles, in which there is a catarrhal inflammation of this area, the treatment consciously or unconsciously has been directed toward relieving irritation of the peripheral nerve endings of this area which are constantly sending impulses to the central nervous system Our theory is that premature ejaculations and final loss of sexual desire are part and parcel of the same process With excess stimulation due to the catarrhal inflammation present, one would expect a hypersensitivity of the nerve endings with consequent premature ejaculation. As this stimulation continues, the nerve centers in the spinal cord either become fatigued due to the continuous stimulation or, because of the constant inflammatory condition about them, become damaged, with the result that impulses

are not carried through them Treatment then is logically directed toward relieving congestion and irritation in the posterior urethra, prostate, and seminal vesicles in order to put the nerve endings in a more receptive condition This is accomplished by massage of the prostate, weak instillations of silver nitrate with a Bangs' instillator, and stimulation of the nerve endings by cold sounds, physical therapy, such as faradic stimulation of the posterior urethra, as well as rectal diathermy Kovacs believes that physiotherapy plays a most important role in relieving congestion of the posterior urethra [8] He claims that treatment, comprising massage of the prostate, deep instillations, and rectal irrigations, means long treatment with varying results He recommends treatment with faradic current with the rate of discharge of the spark gap not to exceed 30 per minute This increases tone and tends to relieve the congestion of the posterior urethra Rectal diathermy is also recommended in our clinic Hot and cold douches and showers, as well as hip baths, act as stimulants to the central nervous system Further study of the physiology of both stimulation of the nervous centers and of nerve endings will be of great help in the understanding of the problem of impotentia The success of our treatment depends upon the extent of injury already sustained by the nervous system and its recuperative powers

Aphrodisiacs such as yohimbine and cantharadin have not been found of much value in stimulating those cases in which there is lack of desire, premature ejaculation, or lack of normal erection In general, treatment tonics containing arsenic and strychnine are given with fairly satisfactory stimulating results In those cases in which there is hyperirritability of the nervous system, sedatives are employed Full, well-balanced diets are constantly recommended with adequate quantities of alpha-tocopherol

Endocrine therapy has been used extensively, but, as has been pointed out, if the glands are not impaired or deficient, they will not respond to such stimulation.[9] Testosterone is given in doses ranging from 25 mg three and four times a week, depending upon the extent of the endocrine pathology or deficiency An excess of testosterone causes inhibition of the pituitary with consequent failure of the gonadotropic hormones to enter into the blood stream This is a checking mechanism since the decline of pituitary stimulation causes a similar decline in testicular secretion The influence of testosterone propionate on the testes is variously interpreted The general assumption is, however, that the injection of the testicular hormone is the substitution of the gland's own secretion which brings out the secondary sex characteristics and generally stimulates the secondary sex apparatus Severe injury to the seminiferous tubules may result from excess administration of the hormone, as demonstrated by Zuckerman in his work on monkeys [10] Testosterone propionate is of little value in cases that have no endocrine disturbance

In problems in which there is a relative hypogonadism with no congestion of the posterior urethra, dramatic results with testosterone are frequently obtained The drug must be continued, however, for, with cessation of its use, the patient's status regresses In the more nervous type of patient, sedatives are used Anesthetic ointments on the glans penis in premature ejaculation have been recommended by some authors Further investigation regarding the pathology of nerve endings and their response to stimulation may open new vistas as to the proper treatment of obstinate cases

Those cases which are purely psychic should be handled by a physician trained in psychiatry However, all organic disease must be first ruled out before the patient is referred to a psychiatrist Logically, the study of cases of impotence falls to the care of the urologist because of his training in diseases of the genitourinary tract and his consequent ability to rule out any organic lesions which may be causing impotence In all cases, reassurance, sympathetic management, and correction of misconceptions are essential Therapy must be of an all-inclusive nature which requires a high degree of interdepartmental cooperation directed to the correction of the basic defects, whether organically or functionally determined

Summary

The problem of impotentia in the male has been surveyed as a clinical entity with special consideration of the physiologic and pathologic factors involved A method of approach to the problem has been described, and therapeutic aspects have been discussed

GIANT FOLLICLE LYMPHADENOPATHY

SAMUEL E COHEN, M D , Elmira, New York, and VICTOR W BERGSTROM, M D , Binghamton, New York

(From the Arnot-Ogden Memorial Hospital, Elmira, and the Binghamton City Hospital, Binghamton)

GIANT follicle lymphadenopathy is to be understood as a pattern of hyperplasia with potentialities for multiple differentiation, the end phase being unrecognizable in the initial morphology This disease is a composite condition of a potentially malignant lymphoma In its earliest form it begins as a lymph node hyperplasia in which undifferentiated cells that possess unrestrained potency for differentiation particularly participate Giant follicle lymphadenopathy is characterized by its ability to change its morphologic form and is capable of direct transformation into one of several structural modifications lymphatic leukemia, lymphosarcoma, polymorphous cell sarcoma, and Hodgkin's disease The disease need not change its histologic pattern but can steadfastly maintain its original pathodiagnostic architecture unaltered until death (giant follicle lymphoblastoma) Recently, the concept of the pluripotentiality inherent in giant follicle lymphadenopathy was expanded to include the transformation into reticulum cell sarcoma of bone [1] The pathoanatomic forms which this disease can assume are now seven in number Each of the various terminal manifestations does not constitute a separate disease but represents an end phase

Originally, the disease was called giant follicular hyperplasia but the name changed to follicular lymphoblastoma to indicate that the prognosis is uncertain and may be poor Regressions, exacerbations, and complete remissions are possible In its early stages, the ailment is still reversible More frequently, the disease progresses slowly, takes the course of a malignant neoplasm, and, according to some, is invariably fatal [2] The totality of phases, the terminal manifestations, and the prognoses can be schematized as follows (Table 1)

The disease has multiple unique features It is the purpose of this presentation to review briefly some of the patho-anatomic forms and indicate the clinical course Secondly, of all the malignant lymphomas, giant follicle lymphadenopathy has a relatively better prognosis than other forms in this category The disease develops and progresses slowly, it is particularly radiosensitive in some phases These features we shall attempt to correlate with the morphology

TABLE 1 —SCHEMATIZATION OF THE COURSE OF GIANT FOLLICULE LYMPHADENOPATHY

Simple inflammatory hyperplasia of lymph node	Follicular inflammatory hyperplasia	Giant follicle lymphadenopathy (Follicular lymphoma) (Giant follicular hyperplasia)	Giant follicle lymphoblastoma Lymphosarcoma Lymphatic leukemia Hodgkin's disease Polymorphous cell sarcoma Reticulum cell sarcoma
Reversible		Reversible Recurrent	Irreversible

Brill-Symmers disease probably dates to Cohnheim (1865) who introduced the term pseudoleukemia when he described a case which seems to have been a follicular lymphadenopathy Lennander (1893) and Pfister (1901) recorded similar cases Becker (1901) retained pseudoleukemia in his presentation of an instance of hyperplastic activity in lymph nodes accompanied by splenomegaly Detailed reports of the entity were then given by Foix and Roemmle (1902) Kettle (1920), and de Long (1921) In 1925, Brill, Baehr and Rosenthal gave impetus to the recent appreciation of the disease when they discussed fully the clinical and histologic features These authors identified giant follicle lymphadenopathy as a variety of lymphosarcoma from which it required differentiation. They interpreted the disease as an intermediate condition between lymphosarcoma and lymphatic leukemia or in the earlier stages as a transition between hyperplasia and lymphosarcoma. Symmers in 1927 and 1938 postulated an inflammatory or toxic origin and demonstrated the ability of giant follicle lymphadenopathy to change its histologic appearance and become polymorphous cell sarcoma or Hodgkin's disease. In 1946 reticulum cell sarcoma was introduced as a terminal outcome of this disease and it was demonstrated that the follicular pattern could be maintained unaltered into death (giant follicular lymphoblastoma)

Case Reports

Apparent Curability

Case 1 —R C , a white man aged fifty-six, was referred in 1943 because of a mass which had developed near the angle of the jaw on the left side The tumor appeared to be part of the parotid gland and was demarcated from the adjacent structures and not tender Other nodes were found in the neck, axillae, and groins The spleen and liver were not enlarged. The region of the parotid tumor was explored and biopsied A giant follicle lymphadenop-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Pathology and Clinical Pathology May 20 1948.

athy was diagnosed, and the patient received two courses of radiotherapy All palpable tumor masses disappeared, there has been no recurrence It is five years now, and the man is apparently well

Case 2 —E S , a white, thirty-one-year-old housewife, with two children, was first seen in 1942 She complained of a "bunch" in the throat of four weeks duration which was growing and causing a drawing sensation An enlarged lymph node was found along the right side of the neck and was completely excised There was no other lymphadenopathy nor any visceral enlargement The pathologic diagnosis was giant follicle lymphadenopathy proceeding into lymphosarcoma A course of nine x-ray treatments was given to the lateral neck region Six years have passed, and there has been no reappearance of the disease, no further treatment was necessary The woman has in the meantime developed a multiple sclerosis

Protracted Recurrent Course

Case 3 —E H (reported with Dr J H Hunt) was a white, unmarried woman of twenty-two when first seen in November, 1940 She was then admitted to the hospital for the removal of a tumor of the navel She had always known a mass to be present in the umbilicus, but this tumor had enlarged to the size f a plum within two to three months The tumor as excised and found to be a cyst, 1 cm in diameter, filled with yellow sebaceous material Microscopically, a stratified squamous epithelium was seen lining a wall composed of connective tissue, and the diagnosis of an epidermoid cyst was made Recovery was rapid and final. A urinalysis during that time showed numerous pus cells and occasional erythrocytes

The patient consulted the hospital for a second time in March, 1943, as a twenty-four-year-old, married, childless woman with a complaint of pain in the back which radiated down through the legs She was unable to stand erect for any long period of time There was a sense of weight and fullness in the abdomen These symptoms were of three weeks duration There had been a weight loss of 15 pounds and some transitory pruritus

Physical examination disclosed a few, slightly enlarged, cervical lymph nodes on both sides of the neck, being larger on the right side The abdomen was flat and soft, the liver and spleen were not enlarged An uncinate tumor mass was palpable to the right of the navel This tumor was irregular in outline, hard, and somewhat nodular It seemed to arise on the right side, in the midrectus line, descend U-shaped around and below the umbilicus, and extend to the left chondral margin terminating at the left paramedian line Both kidney regions were tender No lymphadenopathy was found in the groins nor in the axillae The examination of the rectum and the gynecologic survey were normal Reflexes and extremities were normal, lungs and heart were also normal

The initial impression was that of a horseshoe kidney but intravenous pyelography revealed good filling of both sides with no particular abnormality in either kidney The gastrointestinal series (fluoroscopy and serial plates) disclosed no evidence of any organic lesion within the bowel The x-ray examination suggested a retroperitoneal mass which was impinging on the pyloric portion of the bowel and on the hilar regions of the kidneys

Laboratory data included a normal urinalysis, adequate red cell count (4,300,000, 14 3 Gm), decreased white cell count (4,000) with a slight increase of the lymphocytes (polymorphonuclears 58, lymphocytes 38, monocytes 4), normal sedimentation rate, normal blood chemistry, and a normal glucose tolerance curve

A laparotomy was performed on the second day of hospitalization A moderate amount of serous exudate was present between the coils of the intestines, no adhesions were seen Inspection and palpation of each of the abdominal viscera disclosed no abnormal findings A thin-walled right ovarian cyst, 4 cm in diameter, found in the pelvis ruptured on mild manipulation In the retroperitoneum, at the level of the transverse colon, the tumor mass was located in the region of the pancreas from the posterior aspect of which the tumor appeared to arise The mass extended craniad into the lesser omental space, and caudad it could be palpated almost to the lumbosacral prominence In its breadth the tumor occupied practically the entire width of the retroperitoneal space It appeared to be a diffuse, homogeneous tumefaction interspersed with multiple discrete nodules The parenchyma was moderately soft in texture and gray-yellow in color The gross appearance and the topography of the tumor suggested multiple adenomata of the pancreas One of the nodules, about the size of an olive, was removed for study This specimen was encapsulated and contained a richly vascularized pedicle The abdomen was closed with the postoperative diagnosis of a retroperitoneal mesoblastic tumor

The specimen received by the pathologist measured 2 5 cm in diameter It was judged to be firm in consistency and gray-yellow in color Cut surfaces were devoid of any defining structural markings The microscopic sections showed that the tissue was a lymph node The follicles were increased numerically and dimensionally, the germinal centers were enlarged The sinuses were indistinct due to overgrowth of lymphocytes The capsule was intact and not involved by any infiltration The pathologic diagnosis was giant follicle lymphadenopathy

X-ray therapy (2,220 r) was given to the abdomen and lumbar regions from April 16 to 23, 1943, in 16 daily doses ranging from 120 to 160 r (200 kilovoltage peak, half value layer, 0 5 mm Cu and 1 0 mm. Al, 25 milliamperes, 50 Cm.) Already on April 17, noticeable diminution of the abdominal mass was recorded The woman was feeling stronger, and her disposition was cheerful, the tired feeling in the legs had disappeared From August 16 to 23, 1,000 r were given to the neck in five equal consecutive treatments because in the interim the cervical lymph nodes had enlarged bilaterally On August 23, no cervical nodes could be found, on the right side one small residual node was still noticeable The patient had gained 10 pounds and was well gen-

erally, the menstruation was regular, the abdomen soft, and no masses were palpable

The woman was seen at intervals thereafter All of her tumors had faded away, she felt strong and ambitious The patient became pregnant and was delivered on August 21, 1945, of a female child, weighing 7 pounds 13½ ounces, which has developed normally and is in good health

In February, 1946, she consulted Dr L F Craver because of malaise, reappearance of lymph nodes in the neck, and loss of weight She was judged as having responded well to previous irradiation and was given 700 r in two doses to the left side of the neck. In April, x-ray films of the pelvis were taken because of pain in the sacroiliac region, these were negative for bone changes In May, she received 350 r to combat a right inguinal node and the same dose to the anterior of the left upper mediastinum for what appeared to be a small signal node When examined in July, 1946, the nodes in the neck and groin had disappeared, and there appeared to be good control of the disease Dr Craver considered the case to be a generalized follicular lymphosarcoma, fairly radiosensitive "The prognosis may be fairly good for a few years more or less with good control of the disease, but one can only expect the usual outcome "[3]

By October, 1946, nodes had reappeared in the groins, in the axillae, along the neck bilaterally, and pre-auricular on the right side An intense course of radiation in 32 divided doses was given during the fall and winter In February, 1947, a check-up showed that the lymph nodes had again receded and were no longer palpable The general condition of the patient was found to be good, she had become amenorrheic When she was seen in 1948, several small nodes were found, and there was a secondary anemia

Change to Hodgkin's Disease

The authors have had no personal cases illustrating this metamorphosis. We would like to inform you of a unique case which has been mentioned twice in medical reports [4,5] It is an excellent example of the conversion of giant follicle lymphadenopathy into Hodgkin's disease The sequence was briefly as follows

Case 4.—A white woman who was born in 1885 had a tumor removed from her right groin in 1926 In May, 1934, an egg-sized mass was removed from the left groin No pathologic diagnosis was made at either occasion In October, 1937, a spindle-shaped tumor was excised from the left epitrochlear region This was diagnosed as giant follicular hyperplasia, and the case was classified as a probable Brill-Symmer's disease In February, 1940, a lymph node was removed from the right groin and reported as Boeck's sarcoid or tuberculosis

The patient returned again in 1941 for complaints which necessitated a partial gastrectomy Boeck's sarcoid was again diagnosed. A simultaneous liver biopsy revealed miliary sarcoid

In June of 1945, she was readmitted for a radical dissection of the right groin. The pathologic report this time was Hodgkin's disease All of the previous tissues were re-examined, and the original diagnoses were verified This case is, indeed, complex. Attention is directed to the initial giant follicular hyperplasia and the present Hodgkin's disease for which the patient is now being treated

This possibility of change into Hodgkin's disease has been adequately substantiated by Jackson and Parker [6] In their series of 39 cases that showed giant follicle lymphoma, seven later developed Hodgkin's granuloma and two developed Hodgkin's sarcoma

Change to Lymphosarcoma

This is apparently the most frequent transformation Soon after Brill *et al* published their observations, several reports appeared, emphasizing the outcome of giant follicular hyperplasia into lymphosarcoma (Baehr, Baehr and Klemperer, Sugarbacker and Craver, and Stout) [7-11] This evolution occurred so often that the disease assumed the name of giant follicular lymphosarcoma This designation indicates a single finality of form and prognosis Actually, giant follicular hyperplasia is an intermediate transitional phase capable of development into one of three directions (1) regression and cure, (2) persistence as giant follicle hyperplasia with intermittant recurrence, or (3) transformation into one of six other histologic forms There are then at least eight possibilities, of which giant follicular lymphosarcoma is only one Brill-Symmers disease as an eponym is applicable to the totality of phases and forms already enumerated While the disease is still in the intermediate stage of its development, giant follicle lymphadenopathy is the recommended nomenclature

Change to Reticulum Cell Sarcoma

Case 5.—D M , a white woman, when twenty-four years of age in 1936 developed a tumor mass in a breast and homolateral axillary lymphadenopathy A biopsy of a node disclosed numerical and dimensional overgrowth of lymph follicles without compression or obliteration of the intervening lymph sinuses The node was classified as giant follicle lymphadenopathy Following the biopsy, the breast lesion and the lymphadenopathy disappeared spontaneously

The patient required medical advice again four years later (in 1940) for "pains in the joints and bones" which she had suffered intermittently during six years preceding the biopsy In 1942 and 1943 she was again treated for complaints referable to the osseoarticular system

After five months of hospitalization, in 1943, a rib biopsy was performed, and her condition was recognized as a disseminated reticulum cell sarcoma of bone The woman died three months after the diagnosis was made and seven years after the biopsy disclosed giant follicle lymphadenopathy She had suffered pains in the bones and joints for twelve years

It might be said that the successive appearance of the two diseases in this individual was merely coincidental The authors prefer, however to interpret the two entities as interrelated The follicular lymphoma in this individual served as a herald node

for the subsequent reticulum cell sarcoma of the bone The giant follicle lymphadenopathy was a signal node indicating a derangement which then became manifest in the osseous system It is not to be interpreted that the affliction changed its anatomic site (lymph node to bone), rather, the disease remained in the same histologic substrate (lymphoreticular tissue) In the case presented, the association of the nodal follicular hyperplasia and the reticulum cell sarcoma was that of related conditions

Change into Giant Follicular Lymphoblastoma

Case 6—M H was a white woman, admitted in August, 1942, at the age of sixty-three, because of edema around the ankles and in both legs This was of three to four weeks standing and was the second such occurrence, the first having taken place a month previously and having receded spontaneously An x-ray examination at that time had disclosed "a large heart and enlarged kidneys" Dyspnea was present, there had always been some shortness of breath since a heart attack four years previous It was never so uncomfortable as at the time of this admission to the hospital In 1938, the patient had suffered an episode of severe precordial pain with radiation to the left shoulder and arm, but this required no medical care There had been no other ailments

Physical examination disclosed edema of both lower limbs and in the abdominal wall and an enlarged spleen extending five finger-breadths below the costal margin Lymph nodes were palpable in the posterior cervical chain, in the supraclavicular and axillary fossae, and in both inguinal regions The blood pressure was 180/90 The admission impression was *Hodgkin's disease or lymphatic leukemia* A lymph node was removed from the neck for diagnosis Microscopically, the typical architecture of giant follicular hyperplasia was noted

Deep roentgen therapy was commenced, and after one month the patient was discharged to the clinic for continuation of irradiation The patient did not fare well and returned in March, in May, and in July of 1943 Bilateral pleural effusion and abdominal ascites had set in, requiring frequent tapping in those months The lymph nodes and the spleen continued to enlarge, generalized anasarca appeared She died on July 9, 1943, at the age of sixty-four after eleven months of illness

The autopsy disclosed a disseminated, malignant lymphoma with the histologic pattern of the giant follicle type intact Splenomegaly with the same microscopic architecture was also present All lymph nodes were involved, the enlargements being preponderant in the mesenteric and retroperitoneal regions Lymph follicles had appeared in the liver, cancellous bone, lungs, and in areas generally deficient in lymphadenoid tissue In the kidneys the lesion was of a diffuse, infiltrative character, as was also the case in the heart, adrenal gland, uterus, and ovary The thyroid, bowel, and pancreas were not involved In this case the pathodiagnostic follicular pattern had remained unchanged from beginning to end

Prognosis and Radiosensitivity

Gall and Mallory in their cytologic classification of malignant lymphomas reviewed 618 cases and were able to include 42 instances of follicular lymphoma [12] These authors encountered five-year survivals which ranged from 3 per cent of the patients with lymphoblastic lymphoma to 53 per cent of those with follicular lymphoma. Four types (stem cell, clasmatocytic and lymphoblastic lymphomas, Hodgkin's sarcoma) offered a relatively poor prognosis with survival medians of six-tenths to one and one-tenth years. The remaining three types (lymphocytic, Hodgkin's and follicular lymphomas) tended to run comparatively slower courses with medians of two and four-tenths, three and two-tenths, and five years, respectively Hellwig studied 202 cases of malignant lymphoma for their cellular constitution [13] His five-year survival rates were almost identical, from less than 5 per cent in lymphoblastoma to about 50 per cent in follicular lymphoma

Gall, Morrison, and Scott surveyed 63 cases of giant follicle lymphadenopathy which were hospitalized during the period from 1917 to 1939 [14] They demonstrated five-year survivals in 47 per cent of the cases and ten-year survivals in 11 per cent For comparison the authors studied 50 instances of malignant lymphoma exclusive of the follicular variety In this control group 19 per cent survived five years and 4 per cent ten years The mortality for follicular lymphoma *of less than two years duration was 20 per cent*, in the comparative group 56 per cent lived less than two years Incidentally, those who succumbed to follicular lymphoma had lived five and two-tenths years on the average, of those alive at the time of their study the average duration of the disease was six and eight-tenths years

Recently, Stout, after reinvestigation of his material, could confirm the conclusion that the giant follicular tumors maintain a statistic advantage in comparison to reticulum cell and lymphocytic cell tumors of lymph nodes 36 8, 15 4, and 20 per cent, respectively, survived five years, while 15 8, 9, and 7 5 per cent, respectively, survived ten years [11]

The multicentricity of the foci and the initial site of the disease are additional determinant factors in the prognosis of the disease Individuals with solitary lymph node involvement do better than when a group or groups of nodes are involved As the disease progressively overtakes various regions and establishes multiple foci, the prognosis becomes graver Multicentricity of foci can overbalance a persistence of the structural pattern so that the disease can terminate fatally *even though the pathodiagnostic follicular*

pattern has been steadfastly maintained A striking feature which Stout demonstrated was the great difference in the ten-year cure rate between those cases which start in lymph nodes and spleen and those which are primary elsewhere "For the lymph nodes only 7 2 per cent were symptom-free at ten years while 25 7 per cent with tumors primary elsewhere were well over ten years after treatment "[11]

Radiotherapeutists are impressed with the conspicuous radiosensitivity of giant follicle lymphadenopathy Small to moderate dosages suffices to yield a therapeutic result Failures to respond favorably are rare [15] Rubenfeld in his follow-up of patients treated for giant follicle lymphadenopathy and for polymorphous cell sarcoma found 66 and 60 per cent, respectively, were well five or more years after start of radiotherapy [16,17] Previously, five-year survival rates were quoted at 47 to 50 per cent Rubenfeld emphasized the difference in the response between giant follicle lymphadenopathy and the polymorphous cell sarcoma derivative His follicular lymphomata receded quickly and required moderate radiation, while the sarcomatous variety regressed only after intense treatment and showed a lag period before response These dual features, the general radiosensitivity of the disease and the differences in the response of allied terminal forms, have a common pathoanatomic background

Brill-Symmers disease is a composite entity consisting of various phases and multiple morphologic manifestations. The disease has all the potentialities of a malignant condition, but the degree of malignancy, both pathologic and clinically, varies in the different subdivisions Of all the malignant lymphomas, giant follicle lymphadenopathy has a better prognosis than other forms in the group This disease develops and progresses slowly, its response to irradiation is gratifying This comparatively favorable course of giant follicle lymphadenopathy is determined by its morphology The prognosis of Brill-Symmers disease is an attribute of its structure. In its earliest form the disease begins as a lymph node hyperplasia histologically resembling the inflammatory-toxic type Fundamentally, the disease is characterized by a morphologic pattern that is a differentiated form of structural arrangement It is this degree of differentiation that determines the development and the radiosensitivity outcome In its early phases the disease is reversible or curable. When it has become transformed into a dedifferentiated structural modification, the course is irreversible, and the outcome is fatal. The development and prognoses of giant follicle lymphadenopathy are conditioned by its morphologic differentiation The prognosis deteriorates as the pattern of differentiation originally inherent in the disease disintegrates

Radiosensitivity does not always indicate curability While the disease responds in the beginning, it progressively becomes radioresistant Of those patients surviving five years, about one half to two thirds will not reach the ten-year mark, and the impression exists that even ten years is not a sufficient length of time to be sure that a malignant lymphoma may not reappear Although usually highly responsive to radiotherapy, most frequently the disease progresses slowly, taking the full course of a malignant neoplasm, and, in the experience of many, is invariably fatal under the methods of treatment now routinely available Life can be maintained, however, and in ever-increasing survival rates

Summary

1 Giant follicle lymphadenopathy is a composite condition of a potentially malignant and fatal disease. The multiplicity of phases and forms are enumerated

2 Cases are cited to illustrate some of these forms and to indicate the variation in the clinical course

3 Of the malignant lymphomas, giant follicle lymphadenopathy has a relatively favorable prognosis It is also strikingly radiosensitive

4 These features are attributes of its particular morphology differentiated forms of structural arrangement

5 The prognosis and the therapeutic response deteriorate as the pattern of differentiation originally inherent in the disease disintegrates

Discussion

Joseph C Ehrlich, M.D *New York City*—The practical aspects of follicular lymphoblastoma, as concerned with problems of therapy and prognosis, have been well worked out by studies in the past twenty years It appears that, as time goes on, fewer and fewer cases remain of which it may be said that complete regression without recurrence took place It is known that the disease may remain comparatively quiescent under therapy for as long as twenty years and still threaten to go into an invasive and malignant phase. While one cannot dogmatically assert that every instance of follicular lymphoblastoma must, of necessity, eventually terminate in a variety of malignant lymphoma, the consensus of experience makes this a safe prediction once the diagnosis is established

There is much less uniformity of opinion about the precise terminology, classification, and interrelationship with other varieties of lymphoma. The viewpoints expressed by Drs Cohen and Bergstrom, regarding the manifold developmental potentialities of follicular lymphoblastoma, have many supporters In addition to those referred to by the au-

thors, I might mention a survey of the material at the Army Institute of Pathology recently completed by Dr Philip Custer, who has kindly provided me with some statistics of a rather large series Of 1,190 malignant lymphomas received at the Institute between Pearl Harbor and VJ Day, 110 were classified as follicular lymphoblastoma, an incidence of a little over 10 per cent In all cases where follow-up data are available, the disease has either persisted or undergone transformation to lymphosarcoma of the round cell or reticulum cell varieties A few instances of transformation to lymphoid leukemia and Hodgkin's granuloma were also recorded These changes took place after some unpredictable interval of persistence as lymphoblastoma, and the conclusion was reached that total regression in this disease does not occur but that it may be expected either to persist as follicular lymphoblastoma or to undergo transformation, predominantly to lymphosarcoma The experience at Lebanon Hospital and Mt Sinai Hospital has been that all transformations take place in the direction of lymphosarcomatosis, and follicular lymphoblastoma is looked upon as a special category of lymphoma belonging to the group of lymphosarcoma Two cases developed a lymphoid leukemic blood picture

The discrepancy of experience may be the result of different viewpoints regarding the significance of the finding of follicular architecture in lymphomas It is a fact that early lesions of Hodgkin's granuloma, Hodgkin's sarcoma, malignant reticulosis, and certain leukemias may, at times, present a conspicuous follicular arrangement These cannot always be differentiated from follicular lymphoblastoma in which one expects to find not only a pronounced increase in the number and size of follicles but also rather characteristic small, compact, hyperchromatic, round and polygonal cells of the lymphoblastic series constituting the bulk of the cytologic elements in the swollen follicles In a recent experience, a patient with lymphadenopathy was subjected to a biopsy of a lymph node This gland condition was interpreted as follicular lymphoblastoma Some months later, a second node was excised and reported as Hodgkin's granuloma It is tempting to cite this as an instance of transformation However, another pathologist who examined the first lymph node interpreted it as Hodgkin's disease

It appears doubtful whether especially fine histopathologic criteria can settle this controversy Perhaps further developments in biologic technics like the leuko-agglutination of Steinberg and Martin, who reported that rabbit antisera to lymphosarcoma cells do not agglutinate cells of lymphatic leukemia, or other methods such as tissue culture and anterior chamber transplants may prove useful in promoting a more objective classification of the varieties of lymphoma

INTERNATIONAL HEALTH PROGRAMS

The World Health Organization, now firmly established as a member agency of the United Nations, held its first World Health Assembly in Geneva in June and July, 1948 As a major part of the constructive work of the Assembly, provisional agenda for various international programs were drawn up and approved

The Committee on Programme placed malaria control first on the list of recommended activities in view of the high prevalence of the disease, then maternal and child health, tuberculosis and venereal diseases For further activities it was recommended that particular attention should be given to alcoholism, drug addiction and habit-forming drugs, hygiene of seafarers, influenza, nursing, nutrition, rural hygiene, and schistosomiasis

DEXEDRINE AND WEIGHT REDUCTION

E PHILIP GELVIN, M D , AND THOMAS H MCGAVACK, M D , New York City

(From the Endocrine Service, New York Medical College Welfare Island Dispensary Unit)

A LOSS of weight associated with a decrease of voluntary food intake has been noticed since the earliest experiments on the pharmacology of amphetamine sulfate Ulrich, who used amphetamine sulfate for the treatment of narcolepsy, and Davidoff and Reifenstein, who employed it for the treatment of depressed states, observed a loss of weight in most of their patients [1 2] Since then, many reports have appeared, most of them enthusiastic, describing the value of this drug as an adjunct to weight reducing regimes [3–10]

In most of these studies, the drug was administered in conjunction with a low calorie diet, Pilner going so far as to insist that it was of little use unless coupled with a dietary regime [3 4 6 8 10] Albrecht, however, was able to accomplish satisfactory weight reduction by use of amphetamine sulfate alone, the loss of weight being ascribed to a diminution of appetite with consequent lessening of caloric intake [5] Rosenthal and Solomon found that patients lost weight seven times as fast when diet was combined with amphetamine sulfate as they did when diet alone was used [8]

More recently, the dextrorotatory form of amphetamine sulfate has become available and is said to be more effective and less toxic than the racemic type [9] Colton concluded that the latter contains more of the cerebral stimulating factor, while the former exhibits more appetite depressing qualities However, this fine distinction has not been definitely established Harris and Ivey have found d-amphetamine sulfate approximately twice as potent as r-amphetamine sulfate [11]

The mechanism of appetite depression by amphetamine sulfate is still obscure It has been found that these drugs cause an increase in the emptying time of the stomach by decreasing the tonus of the stomach and by increasing that of the pylorus [12 13] However, the dry weight of the stool is not diminished, so there is apparently no decrease in absorption or assimilation [7] Anorexia and weight loss were unchanged after surgical ablation of the sensory nerves (vagi and thoracolumbar visceral afferents) of the gastrointestinal tract, a fact which suggests that the drug produces its effects through some central nervous system action.[11] This concept was tentatively confirmed when amphetamine sulfate failed to reduce the voluntary food intake of patients on whom a surgical frontal lobotomy had been performed [11]

Materials and Methods

Subjects—Thirty obese men and women regularly attending the Welfare Island Dispensary were selected for this study The period of observation varied from four to forty weeks, with an average of nineteen and six-tenths weeks Their ages ranged from fourteen to sixty-eight years Three were men, and 27 were women Twelve were white, and 18 were Negroes

Since all of the patients had been attending some other branch of the clinic before they were referred to us, their weights had been recorded for considerable periods of time No patient was accepted for this study if it was felt that a spontaneous loss of weight was occurring

Many were suffering from other conditions besides the obesity There was hypertension (systolic above 145, and/or diastolic above 90) in 14, diabetes mellitus in one, asthma in two, an inactive duodenal ulcer in one, and chronic nephritis in one

Procedure—On admission to the clinic, a complete history and physical examination were performed on each patient This examination always included the recording of height, weight, upper and lower measurements, span, circumferences at the neck, chest, waist, hips, and thighs, pulse rate, and blood pressure

Among the routinely performed laboratory determinations were a complete blood count, urinalysis, six-hour glucose tolerance test, blood cholesterol and esters, total serum proteins, basal metabolism, electrocardiogram, and x-ray of the skull for bony changes

Each patient was then given amphetamine sulfate by mouth in its dextrorotatory form (Dexedrine) * Every subject was given 5 mg , twenty to thirty minutes before each meal (15 mg daily) as an initial dose This was rapidly increased, if tolerated, to 10 mg before breakfast and lunch, and 5 mg before dinner (25 mg daily), then to 10 mg before each meal (30 mg daily) This latter dosage was not exceeded At each visit the patient was questioned about nervousness, insomnia, palpitation, or dizziness The blood pressure and pulse were checked frequently Patients were first seen weekly, then biweekly and, finally, after being stabilized at the maximum dosages of Dexedrine, every three or four weeks Patients were permitted to eat as they pleased, and fluids were not limited

* Generous supplies of Dexedrine were made available for this study through the courtesy of Mr Swain of Smith Kline and French Laboratories, Philadelphia.

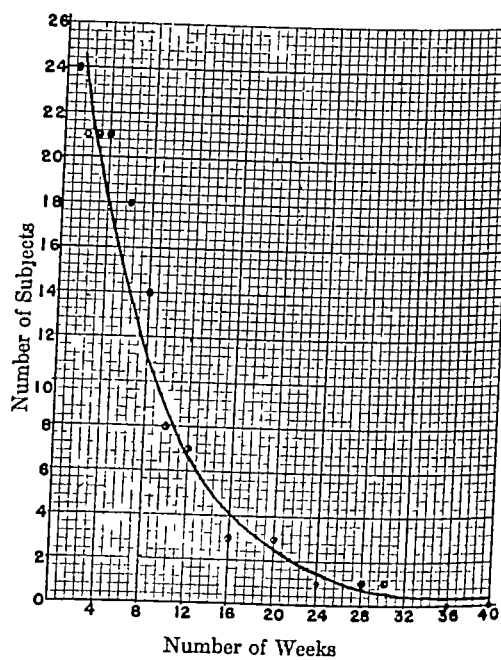
Results

Twenty-seven of the 30 subjects lost weight on the regime described above (Table 1) However, the total loss and rate of loss varied considerably Our standard for a satisfactory decrease in weight was set at a minimum of 1 pound a week From Table 1, it can be seen that only 13 subjects lost this minimum average amount throughout the entire period of observation, of whom ten were under observation for a period of eight weeks or less The suggestion that a satisfactory loss of weight during Dexedrine medication occurred only during the early phase of treatment led to a further analysis of the data for each individual After eight weeks of treatment 14 patients (47 per cent) had an average weight loss of at least 1 pound a week After ten weeks, eight patients (27 per cent), and after twelve weeks, seven patients (23 per cent) fell into this category Beyond this time, the number of patients averaging a loss of 1 pound a week decreased rapidly, until, after twenty weeks, only one patient was able to maintain this average (Fig 1) Figure 2 demonstrates the average loss of weight per person per week plotted against time From this graph, it can be seen that an average loss of weight of a minimum of 1 pound per week for the entire group was maintained for only eight weeks

Untoward effects of Dexedrine medication were observed in eight subjects and were mild in degree and exceedingly few These included insomnia in five instances, nervousness in four, and palpitation, dizziness, and tingling of the hands in one each A moderate increase in blood pressure was noted in five patients One individual had a rise in blood pressure from 164/78 to 230/104 while taking 30 mg of Dexdrine daily The dose of the drug was reduced to 15 mg daily, after which the blood pressure returned to its original



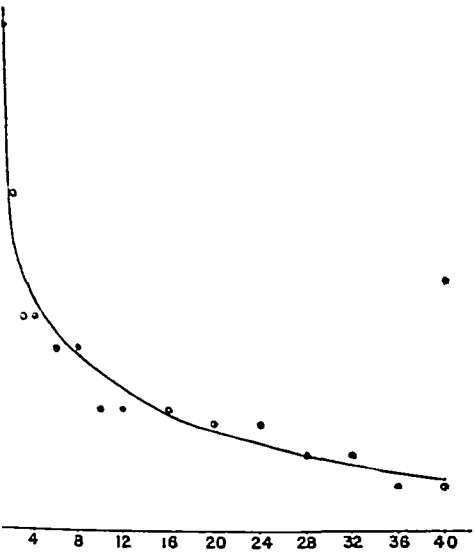


FIG 1 Number of subjects maintaining a loss of 1 pound or more weekly

The average weekly weight loss per subject in 30 subjects treated with Dexedrine.

within one week. The dosage of 15 mg was maintained for three weeks, and then increased to 30 mg daily without any ier significant change in blood pressure This the only patient in whom a decrease in the of Dexedrine was necessary All other manifestations were easily controlled with l doses of phenobarbital

should be noted that the subjects of this re- were clinic patients, all in the lower economic kets, for the most part intellectually under- leged and without exception tremendously weight Our private patients, most of whom business people, and not nearly so obese as e described above, have not tolerated large s of Dexedrine nearly so well They have plained mostly of "increased tension," eriness," and "insomnia" However, all tolerated 15 mg of Dexedrine daily, and more if small doses of phenobarbital were omitantly administered The appetite of ents in private practice has been depressed factorily by Dexedrine, and results have been dramatic than with the clinic group since ary instructions were simultaneously ob- ed

o significant changes in pulse rate were noted ty of the subjects

he laboratory and special diagnostic tests nerated above (Materials and Methods) were ated in nine of the subjects In no case was e any significant variation from the original ngs

All of the patients stated on direct questioning that their appetite was decreased while taking Dexedrine Moreover, several who did not keep appointments and consequently ran out of the drug volunteered the information that their appetite increased when the medication was not available

During the early phase of this study, it was necessary to substitute r-amphetamine sulfate for Dexedrine on several occasions It was found that there was no appreciable difference between the two in equal dosage, either subjectively or objectively Occasionally, a patient preferred the dextro form, while an equivalent small number preferred the racemic form. These findings are at variance with the conclusions of others who have found the dextro variety of amphetamine sulfate more potent [9 11]

Conclusions

In its simplest form, it may be stated that the weight of an individual is dependent upon the relationship between food intake and energy output Consequently, any regime which has as its object the reduction of weight should either decrease the former, increase the latter, or both In this series of experiments, the effect of Dexedrine upon decreasing food intake by reducing appetite was studied The effectiveness of this method was measured by the amount and rate of weight loss From the data obtained, it can be concluded that Dexedrine is effective in causing a loss of weight In this group of patients toxic manifestations were infrequent, usually mild, and never serious It was the subjective impression of most patients that the appetite was definitely decreased However, since most obese patients are, a priori, victims of faulty eating habits, this medication alone was not completely effective in restoring weight to ideal levels It would appear that a properly regulated dietary regime is also necessary, if a satisfactory rate of weight loss is to be maintained

Diets low in calories (1,000 to 1,200 calories) were given to several of these patients following the period of observation covered in this study However, since it was impossible for most of them to adhere to a diet, either for intellectual or economic reasons, no additional conclusions can be drawn

Summary

The effect of Dexedrine on weight reduction was studied in 30 obese individuals It was found that satisfactory weight reduction (a minimum of 1 pound a week) could be maintained for an average of approximately eight weeks After that, the weight soon became stabilized at a lower level, and a satisfactory rate of weight reduction

could not be maintained on the dosage of Dexedrine used (a maximum of 30 mg daily) Toxic symptoms were infrequent and mild No significant change in the blood count, urinalysis, basal metabolic rate, electrocardiogram, glucose tolerance, blood cholesterol, and blood proteins was discernible in nine patients on whom these tests were performed before, during, and after medication

VISCERAL INVOLVEMENT IN MULTIPLE MYELOMA

ALVIN J GORDON, M D , and JACOB CHURG, M D , New York City
(From the Department of Pathology Laboratories of Mount Sinai Hospital)

VISCERAL involvement in multiple myeloma, other than by direct extension from a bone lesion, was considered a rarity until recent years A number of isolated cases can be found in the literature, but systematic studies have been lacking [1-3] Lowenhaupt in 1945 reported finding "plasma cell infiltration" of the spleen and lymph nodes in every one of 12 cases of multiple myeloma, without, however, specifying the exact nature of these plasma cells [4] On the other hand, Lichtenstein and Jaffe could find only two instances of visceral lesions among their 18 autopsied cases [3]

For the purpose of studying the incidence of visceral involvement, we reviewed 30 consecutive cases of multiple myeloma coming to autopsy at the Mount Sinai Hospital between the years 1933 and 1947, and found, contrary to expectation, that such involvement could be established in nearly three fourths of all cases

Tabulation of reports in the literature shows that the viscera most commonly involved are the spleen, lymph nodes, and liver [1] In our series, 22 cases showed lesions of the latter organs Usually, all three were involved In nine of these 22, myeloma cells were found also in other viscera

The presence of lesions could be established in ten cases on the basis of gross examination alone Such lesions were often not striking and could easily have been overlooked In half of this group there were, particularly in the liver, single or multiple, scattered, grayish-white nodules, 0 1 to 1 cm in diameter In the remaining five cases involvement was much more pronounced, consisting of streaks or solid, poorly circumscribed areas of tumor tissue, obliterating the normal architecture of the liver or spleen, or converting the involved lymph nodes into huge fused masses The largest spleen weighed 2,000 Gm , and the largest liver weighed 3,300 Gm

In seven of the 30 cases myelomatous infiltration of the spleen or lymph nodes could have been suspected on gross examination because of moderate enlargement and increased consistency of the organ, loss of normal markings, and disappearance of the follicles The significance of these changes was not realized until the present study was far advanced The presence of lesions in this group, as well as in five other cases showing no obvious gross changes, was established only by microscopic examination

The nature of suspicious looking cells in sections of viscera could be readily recognized in some of the cases All that was necessary was to compare them carefully with the cells of the bone tumor In other instances, however, the appearance of the myeloma cells was modified by postmortem changes, poor fixation, action of acid in the process of decalcification, and other similar artificial factors, so that many of the

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Pathology and Clinical Pathology May 19 1948

identifying features were obscured Unless such myeloma cells occurred in true nodules, even if these were of microscopic size, their identity could be definitely established only by the presence of special features, such as unusually prominent nucleoli, multinucleated forms, or characteristic nuclear and cytoplasmic inclusions Among the latter were eosinophilic globules in the cytoplasm, basophilic granules following stilbamidine treatment, and rod-shaped bodies in the nucleus [5]

On microscopic examination of the liver, myeloma cells were found in the sinusoids and, considerably less frequently, in the periportal fields When sufficiently numerous, they compressed the liver cords, producing atrophy of the cells and forming grossly visible nodules and gray streaks

In the lymph nodes individual myeloma cells could be seen within the medullary cords and interfollicular areas as if replacing individual lymphocytes As the number of myeloma cells increased, the lymphocytes decreased, germinal centers disappeared, and the architecture became obscured Small nodules of tumor cells occurred within the pulp and particularly in the sinusoids Eventually, the entire lymph node was replaced by the tumor cells in leukemic fashion Infiltration of the capsule was noted on occasion

Changes in the spleen were similar to those seen in the lymph nodes Myeloma cells lay in the sinusoids, either in close approximation to the lining endothelium or filling the lumen They also appeared in the pulp cords, often congregating around the small arterioles and the trabeculae The architecture of the red pulp became obscured, while the follicles decreased in size and number and finally disappeared Distribution of the myeloma cells was often uneven, producing the previously mentioned gray areas or even true, sharply defined nodules However, when infiltration was diffuse and even, the appearance of the organ was very similar to that seen in leukemia

In nine cases, myeloma cells were observed in organs other than those of the hematopoetic system As mentioned before, in all of these cases the hematopoetic organs were also involved In four instances tumor cells merely lay free in the capillaries of the renal medulla or the lung The fifth case presented a small focus in the tonsil. This may indicate the need for more thorough investigation of the tonsils in all cases of multiple myeloma In the sixth case, there was infiltration of the renal parenchyma and a polypoid nodule in the colon In the seventh, small, sharply circumscribed nodules appeared in the renal cortex, renal capsule, pleura, and periaortic fat The eighth and ninth cases were examples of widespread invasion of various organs (lung, diaphragm, epicardium, subcutaneous tissue, and voluntary muscles in one and peritoneum, pleura, lung, kidney, testis, and periadrenal fat in the other), in addition to massive splenomegaly, hepatomegaly, and generalized lymphadenopathy

Among our 30 cases, eight, or 27 per cent, were classified as showing no visceral involvement In some of them suspicious-looking cells were present, particularly in the spleen, but all our criteria were insufficient to prove their myelomatous nature A few cases showed rare scattered myeloma cells in larger vascular spaces of the spleen These cells, as well as the cells found in the renal and pulmonary capillaries (see above), were undoubtedly brought by the blood stream It is known that myeloma cells very frequently occur in the blood [6] Blood smears were available to us in eleven of our cases, and five of them showed myeloma cells varying in amount from less than 1 to over 70 per cent of all white cells Finally, there were cases in which no myeloma cells could be found in the viscera, despite the fact that autopsies were performed very soon after death, tissues were well fixed, and the sections were of excellent quality Obviously, visceral involvement is not as constant, nor, generally, as massive as involvement of the bone marrow Perhaps the former represents an extension of the latter in the sense that the stimulus causing proliferation of the myeloma cells in the marrow eventually acts upon the reserve hematopoetic tissue If this is true, the occurrence of visceral lesions would be conditioned by the intensity of the stimulus on one hand and by individual responsiveness of the reserve tissue on the other hand

Summary

1 In addition to the bone marrow, other organs of the hematopoetic system (spleen, liver, and lymph nodes) are involved in a majority of cases of multiple myeloma

2 Infiltration of other viscera occurs but more rarely

3 Careful cytologic study is often necessary to establish the presence of visceral lesions

TESTICULAR TUMORS

N Chandler Foot, M D , New York City
(From the Department of Pathology, Cornell University Medical College)

IT IS the purpose of this paper to consider the tumors of the testis seriatim in the order of their probable origin from various elements of the gonad and its adnexa. In this way there is an automatic classification which is based on the sound principles of anatomic structure and not merely on the less satisfactory foundation of morphologic appearance under the microscope Such a classification has already been promulgated by Friedman and Moore, but there is some room within its frame for expansion and addition.[1] They, too, have apparently recognized the value of considering anatomic units of an organ as potential sources of its various tumors, a method of thought which not only simplifies classification but clarifies understanding The malignant group of tumors, which will be called "dysgerminoma" in this paper, has all too long gone under a variety of names that have successfully confused clinicians, if not pathologists

Testicular Parenchymal Tumors

The group of tumors arising from the testicular parenchyma has been named "gonocytoma" by ' ı of Copenhagen, it is not peculiar to ..ɔ women have analogous growths, aderived from the same primordium (the ·¬ body) [2] These have long been known 'dysgerminomas," and, for that reason, it ٩ well to retain that terminology and to ·ply it to the similar growths in the testis

Seminoma —The simplest and most frequently observed of this group (occurring in about the same percentage of cases as the teratocarcinoma) is the seminoma Its origin has been disputed for a long time, and it is still questionable whether it arises from spermatogonia of the testis or from primitive germ cells which (naturally enough) precede these and resemble them quite closely At all events, its appearance strikingly resembles that of testicular tissue gone awry, it is also one of the better differentiated members of this group Grossly, it is usually about the size of the testis or considerably larger before it is noticed by the patient It is a very firm, fairly well-outlined growth and, on section, light brown and more fibrous on gross inspection than it proves to be under the microscope

Microscopically, it comprises tubular or alveolar spaces in which ovoid or spherical cells are packed fairly closely or, less often, somewhat loosely They resemble spermatogonia or germ cells according to the bias of the observer Situated in the stroma of the compartments are numerous lymphocytes that are seldom absent, Ewing's "lymphoid stroma." More rarely, foreign body giant cells may be noted among those of the tumor, a phenomenon observed in dysgerminomas in women as well. The size of the cells vary from large to relatively small, according to the tumor, a fact which has led some observers to correlate them with different orders of spermatogonia Occasionally very small cells with dense, pyknotic nuclei suggest spermatids

While the growth is indubitably malignant, it is not so much so as are the other members of this group

Embryonal Carcinoma —The second member of this category of dysgerminomas is a tumor which is apt to show a good deal of whitish necrotic material on gross inspection and is also apt to grow more rapidly than the seminoma. On microscopic examination it is found to consist of meandering cords of more or less columnar cells with pale cytoplasm and vesicular nuclei that weave about through a loose, connective tissue stroma The growth has the potentiality of metastasizing to distant parts of the body relatively early, and the metastases may surprise the pathologist by proving to be morphologically more similar to the next tumor in this group, the choriocarcinoma, rather than to the embryonal carcinoma whence they presumably came We had one such example in New York Hospital where the choriocarcinomatous metastasis was found on necropsy at another hospital The veins about the suprarenal were effectually plugged with it As this tumor is one step down the scale of differentiation from the seminoma, it is correspondingly more malignant Friedman and Moore found it to constitute 19 per cent of the tumors in their series of 922 cases It thus ranks second in frequency to seminoma and teratocarcinoma, each of which represented 35 per cent

Choriocarcinoma —This tumor represented only about 0 4 per cent of the series just quoted, although tumors showing choriocdrcinomatous elements mixed with others were not uncommon It is histologically identical with choriocarcinoma in women, whether it originates in the uterus and vagina as a truly chorionic tumor or in the ovary as a dysgerminoma It grows very

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Pathology and Clinical Pathology May 19 1948

rapidly and is apt to be very hemorrhagic Microscopically, it is found to comprise spherical masses of moderately large, often very bizarre replicas of the Langhans cells of the chorionic villi In well fixed specimens these are seen to be enclosed in a syncytial layer of cells which exhibit less metaplasia and closely resemble chorionic syncytia of the placental villi This is the most malignant variety of dysgerminoma

Teratocarcinoma—This tumor, one of the two better differentiated members of the group, occurs in a younger age group than does the dysgerminoma, but it has an equal incidence It grows to considerable size and is usually larger than the usual dysgerminoma when operated on Its gross appearance is rather heterogeneous and nodular, and the growth may contain bits of bone or cartilage visible to the naked eye Under the microscope it is seen to comprise well differentiated areas of bone, cartilage, skin, nervous tissue, and other recognizable histologic elements, and, in scattered foci, masses of totally undifferentiated cells most closely comparable to those of embryonal carcinoma The tumor is often called "malignant teratoma" It is as malignant as its most malignant group of elements, and the fact that much of it shows good differentiation and appears to be a simple teratoma makes no difference in the poor prognosis

Teratoma.—This uniformly well differentiated neoplasm of the testicular parenchymal group of tumors is the teratoma, or "monstrous tumor" It comprises 7 per cent of Friedman and Moore's series and is seldom seen in our hospital. It may attain considerable size but grows much more slowly than any of the tumors we have thus far considered. It is distinctly heterogeneous in its gross make-up, and under the microscope it is essentially similar to any other teratoma or "dermoid cyst" Lacking any groups of malignant, undifferentiated cells, it is nonmalignant

It has been the custom in New York to call almost any testicular tumor "teratoma", this should be strongly decried From the standpoint of the writer there is only one teratoma, and that is the well differentiated, nonmalignant neoplasm just described The term "embryoma" is also sometimes applied to these tumors, and since this means one of the dysgerminomas in one city and denotes an extraordinarily well differentiated and fetus-like growth in another, it should be jettisoned as ambiguous!

It will be evident to one familiar with pathology that this group of tumors merits Theilum's designation of "gonocytoma" as its members are found in the testis and ovary alike and presumably stem from elements in the Wolffian body that would ordinarily produce male gonads The fact that they may be followed from more or less chaotic structures through a course of increasingly good differentiation to something a little less than an embryo might argue that they represent phases in the development of germinal cells from the genital ridge The older theory, to the effect that the better differentiated members of the group, such as teratoma, represent a sort of parthenogenesis, might also appear to be strengthened by the fact that gonadotropic hormones are increased in the blood and urine of patients suffering from such tumors Such a parthenogenesis, however, has yet to produce an intratesticular fetus!

Tumors of Rete Testis

Ordinary adenomas of the rete testis would appear to be a possibility, but they are rarely, if ever, seen, carcinomas arising, presumably, from a malignant transformation of epithelium in this body are rare, but a few have been recorded

Androblastoma—Theilum recently described a unique case of a tumor developing from the primitive rete which he calls "androblastoma"[2] In an orchiectomized testis, removed in connection with prostatic carcinoma, we discovered a tiny example of such a tumor which had given rise to no symptoms In Theilum's case, however, the growth was large, the patient showed feminizing changes, with gynecomastia, lack of hair on the face, and a mildly feminine habitus, libido and potency were lost That tumor was the size of a goose egg and rather meaty, yellowish in color, and not homogeneous Parts of it, later found to be filled with lipidized cells, were bright yellow Under microscopic examination it was found to be identical in its histology with the arrhenoblastoma of the female, it also contained the heavily lipidized areas similar to the "folliculome lipidique" or "adrenal cell tumor" of gynecologic literature The growth was composed of long tubules comprising cells with small nuclei, some of them having the appearance of neural rosettes on cross section, thus resembling mesonephric tubules or the structures so often noted in Wilms' tumors Here again we are faced with a growth common to both sexes The fact that it is feminizing in the one and masculinizing in the other does not disturb Theilum, who points out that it may be noted in connection with other gonadial tumors Androblastoma is a newcomer to the literature, but it is a most interesting and instructive one

Before leaving this part of the discussion, it might be well to point out the similarity between the testicular tumors thus far considered and certain ovarian tumors and also some of the embryonal group of renal growths As they are

all closely connected with the developmental and involutional phases of the mesonephros, this is not particularly strange

Tumors of Epididymis and Vas Deferens

Here again, adenomas are potentially possible but practically nonexistent, carcinoma of the epididymis has been noted occasionally In this case we are probably dealing with a more orthodox development of carcinoma from the epithelium of adult ducts, paralleling that which is seen in tumors of the breast or stomach, for example

Tumors of Interstitial Gland

These are rare and are mentioned only for the sake of completeness Ewing cites instances of Leydig cell tumors in the literature, but they are seldom seen in practice [3] They are dark brown and, under the microscope, consist of cells that are pigmented, granular, and much like those of the glands from which the tumors originate

Tumors of the Tunica Vaginalis

Mesothelioma—For a long time tumors have been encountered at the junction of the epididymis and vas, springing from the tissue over these and producing conical and stony masses that lie with their apices directed upward along the cord Grossly they resemble malignant growths on account of their adamantine consistence and their intimate infiltration of the cord Microscopically, they are found to be chiefly fibrous with numerous widened sinuses, often lined by flat, endothelioid cells and containing what appears to be coagulated lymph They were first known as lymphangiomas and then, because of their tendency to recur, as "lymphangiosarcomas" This is very lax classification, clinical features, in the absence of morphologic confirmation, should not influence the pathologist toward calling a tumor by a name not justified by histologic criteria such as metaplasia and mitotic figures Infiltration, too, is small justification, since it is also shown by certain fibrous and nonmalignant growths, such as the desmoid fibromas

The fact that some of the channels in the growth are lined by plumper cells caused many of us to hesitate—were they endothelial or epithelial? Masson has apparently solved the riddle by attributing them to mesothelial overgrowth and distortion [4] He found the tumors in both sexes, in the female they lie over the uterus and tubes and apparently take their origin from peritoneal mesothelium

Malignant Mesothelioma—One instance of this has been seen by the writer, and the case has not been published, except for mention in a textbook. The patient was an old man who had a tumor, 10 to 15 cm in diameter, arising from his epididymis and overlying a tiny and atrophic testis which seemed to be entirely uninvolved and measured about 3 cm in long diameter The growth exhibited extensive necrosis and great proliferative activity and brought about the death of the patient through multiple metastases Microscopically speaking, it was composed of solid masses of undifferentiated cells growing in alveolar spaces and fulfilling in their appearance the hypothesis that they might represent malignant transformation in the mesothelial elements of a mesothelioma Mitoses were abundant The diagnosis was made in consultation with an observant and quick-witted pathologist from a neighboring hospital, otherwise the tumor might have passed as a carcinoma of the epididymis.

Conclusions

This, then, carries us out of the anatomic boundaries of the testis and its conductive apparatus In covering the growths that occur between the seminal tubules and the vas deferens, it is believed that nothing has been omitted, if we except metastatic tumors such as leukosarcoma in leukemia Such growths must be kept in mind, but they are not intrinsic to the testis and are usually very rarely encountered The classification thus arrived at is, at least, orderly and descriptive, it correlates several of the gonadial tumors common to both sexes, and it relies relatively little upon unimportant morphologic differences

CORONARY DISEASE IN WOMEN

Sol Glotzer, M D , and Henry Wolfer, M D , F A C P , Brooklyn, New York

(From the Medical Services of Kings County Hospital)

THE present study was made in the hope that the causative factors related to myocardial infarction in women would be given prominence Of particular interest was the role played by metabolic diseases and hypertension.

During a period of six and one-half years, from January, 1940, to June, 1946, the records from all services at the Kings County Hospital included a large number of women in whom a diagnosis of coronary occlusion and/or myocardial infarction were recorded at death Of these, 37 were necropsied and constitute the basis for this phase of the report Before continuing with the analysis we should like to clarify the terminology to be used Diagnostic names are still used rather loosely in this group of cardiac diseases Our charts contained clinical diagnoses of coronary occlusion, coronary thrombosis, and myocardial infarction, and it was obvious that no distinction was being made We, therefore, included all such cases in one large group which we call coronary occlusion and/or myocardial infarction

Thirty-five of our cases showed such lesions One of the remaining two was admitted with a history of precordial pain radiating to the left elbow of two week's duration and an acute attack of precordial pain accompanied by cyanosis and pulmonary edema three days before admission. Death occurred twenty-four hours after admission. The electrocardiogram was interpreted as posterior wall myocardial infarction. Marked myocardial fibrosis was found with no infarction or occlusion The second case complained of dyspnea and epigastric pain of two weeks duration and died of pulmonary edema The electrocardiogram showed anterior wall infarction The coronary arteries were patent but sclerotic, and no occlusion or infarction were found We have felt it reasonable to include these cases in our analysis, since such occurrences are occasionally reported

Only one woman in the entire group was Negro She was fifty-one years old and had severe hypertension for many years Hemiplegia had occurred at twenty-seven and at fifty years of age, and her history included several episodes of cardiac failure during the year preceding admission Retinal examination revealed choked disks with fresh and old hemorrhages, spastic arteries, and dilated veins Electrocardiogram showed a left ventricular strain pattern, and the heart weighed 410 Gm at necropsy The only clinical attack of precordial pain occurred two hours before death Necrosis was found at the apex of the left ventricle with incomplete occlusion by sclerosis of its feeder branch of the anterior descending branch of the left coronary artery No thrombus was found On work Houlobeck did in the South, he found 44 of 117 necropsied infarctions in his series to be Negroes [1] It is difficult to correlate the paucity of Negro women in our series with the large number of Negro patients admitted to the hospital in recent years

The age distribution showed a peak between fifty and eighty years, with 32 of the 37 cases being almost equally divided among those three decades The youngest was forty-seven, four were in the eighty-one to ninety-year group, and the oldest was eighty-seven years Among the nine diabetics in the series, the age ranged between fifty-seven and seventy-six years with only two patients below sixty In the known hypertensive group, numbering 18, fifteen were in the sixth, seventh, and eighth decades The average age for the entire group was sixty-seven and seven-tenths years, for the diabetics sixty-six and seven-tenths years, and for the known hypertensives sixty-five and two-tenths years, indicating slight differences These averages are somewhat higher than those reported by Masters who reviewed the literature and found the average age for women dying of coronary occlusion to be fifty-six years as compared with the over-all average age in both sexes of fifty-four years [2] He found the peak decades in 112 women to be the sixth and seventh with six cases under forty Coronary disease has generally been found to occur ten years later in women than in men [3] While Master's group does not bear this out, our average age of sixty-seven and seven-tenths years is significantly higher than his over-all average of fifty-four years Mintz found an average age of sixty-two and four-tenths years in 180 females with recent infarction [4]

Dublin's statistics for the period of four years from 1931 to 1934 shows a lower mortality for women, 3 5 per 100,000 as compared to 16 per 100,000 for men [5] He points out that the relative mortalities of men and women approach each other as the higher age groups are reached At the age period forty-five to fifty-four, the ratio of men to women is 4 1, at fifty-five to sixty-four, 2 5 1, and at sixty-five to seventy-four, 1 84 1 White and Negro women have the same mortality curves

The reason for this age difference is not certain

but may be related to the comparative incidence of atherosclerosis Willius found an increase in blood lipoids in women with coronary disease [3] He suggested that, since the storage of lipoids is increased during pregnancy, the mechanism of lipoid metabolism might be more efficient and so account for the lowered tendency to vascular sclerosis He also found coronary sclerosis in 33 6 per cent of men and in only 18 8 per cent of women in consecutive necropsies, while De Porte in a study of heart disease found coronary sclerosis in 23 7 per cent of 893 men and in only 16 per cent 933 women.[7]

Diabetes mellitus was present in nine of the 37 cases (24 3 per cent), with ages ranging from fifty-seven to seventy-six years, averaging sixty-six and seven-tenths years as compared with the total average of sixty-seven and seven-tenths years Old occlusions were found in two recent infarction in seven of these patients Four of the nine had an associated previously known hypertension Of these, three showed recent infarction The other case showed only myocardial fibrosis along the course of coronary vessels which were markedly narrowed by atherosclerosis At one point sclerosis completely occluded the vessel The heart weighed 460 Gm and was heavier than the other three (300, 300, and 400 Gm , respectively) This high incidence of diabetes is in accord with the statistics of many other observers Coronary sclerosis is found with greater frequency in diabetics than in non-diabetics Root studied the coronary vessels of 316 diabetics over forty years of age and found occlusion in 38 2 per cent of men and in 32 per cent of women as compared with the figures 9 9 per cent for men and 4 9 per cent for women in 152 nondiabetics [8] Enklewitz found coronary occlusion in 31 8 per cent of 261 diabetics [9] Stearns found coronary sclerosis in all of 50 diabetics, of whom 31 were women, and in only 37 per cent of nondiabetic controls [10] He also noted occlusions in 19 of 31 diabetic women and in only 11 of 145 nondiabetic women In Master's series of 112 women with coronary occlusion, 26 8 per cent has diabetes [2] It is apparent that the occurrence of diabetes in women has a statistical significance in susceptibility to coronary occlusion

In a hospital serving an economically poor section of the city, such as that under consideration, many patients are admitted in extremis, and complete accurate histories are often difficult to obtain Without a history of hypertension it is frequently impossible to determine whether the blood pressure of a patient in shock was previously elevated The incidence of hypertension in our series is, therefore, a conjectural rather than an absolute value Eighteen of the 37 patients (48 6 per cent) were definitely hypertensive at some time prior to admission, considering a systolic level over 145 mm and a diastolic over 95 as abnormal The remaining 19 cases were carefully studied for such evidences which could be considered as pointing to previous hypertension. For the purpose of simplicity, this group will be referred to as "unknowns," while those with definite hypertension will be called "knowns." The average heart weight of the "known" groups was 464 Gm with a range of 300 to 690 Gm., while the "unknowns" ranged from 300 to 600 Gm. with an average of 441 Gm. Little difference existed in the age groupings, except that three of the "unknowns" and only one of the "knowns" fell in the eighty-one to ninety group

Several factors were analyzed Cardiac hypertrophy can safely be assumed only when the heart weight greatly exceeds normal, since normal values in themselves are difficult to evaluate. Body height and weight have been correlated with cardiac weight, and a wide range of normals has been reported in various series The only accurate method is to measure individual muscle fibers, and, since this was not done, heart weight must be relied upon for our survey Zeek studied the weight of the normal heart in 224 women and found a variation from 150 to 374 Gm [11] He cites figures from other analyses in which the combined variations are from 110 to 367 Gm with a combined average of 263 Gm. It would then seem reasonable to consider any heart weighing more than 400 Gm as definitely hypertrophied, although Peery used 500 Gm. as the upper limit of normal in his study [12] Five of our unknowns had hearts weighing 500 Gm. or more, ten others weighed between 400 and 500 Gm which placed 15 of the 19 in the category of hypertrophied hearts Using Zeek's tables, in which he correlated body length with heart weight in normal individuals, we obtained for the remaining four cases the figures shown in Table 1 Accordingly, we can consider all 19 of our unknowns as having cardiac hypertrophy

TABLE 1 —CORRELATION OF BODY LENGTH WITH HEART WEIGHT IN FOUR CASES ACCORDING TO ZEEK'S TABLES

Case Number	Body Length (Cm.)	Estimated Heart Weight (±30 Gm.)	Actual Weight
6	152	249	300
25	162	267	350
29	145	236	350
9	166	274	390

Many factors other than hypertension can increase cardiac weight No evidences of significant amounts of edema fluid or inflammatory exudate was found in these hearts In the four borderline cases mentioned above, one showed myocardial fibrosis with several areas of necrosis of muscle bundles, chronic passive congestion,

and mild pulmonary edema Another had a flabby fibrotic myocardium with bronchopneumonia and 200 cc of fluid in the left pleural sac The third had a large infarct with bloody pericardial fluid, and the fourth had an infarct with myocardial fibrosis, mild pulmonary edema, and cardiac failure

The effect of calcific disease of the aortic valve on heart weight was studied by Karsner and Koletsky and in 200 cases the average heart weight was 512 Gm [13] Where calcific valvular lesions existed without deformity, the average weight was 453 55 Gm and rose to 529 Gm if deformity or stenosis were present Simple calcification of the aortic valve, therefore, is not to be considered a significant cause of more than slight hypertrophy unless associated with deformity In our 19 unknowns the description of the valves included the presence of thickening, calcification, and fusion of the commissures Whether sufficient fusion existed to cause actual stenosis could not be ascertained in most of the reports Only three were labeled "fusion," and their weights were 550, 430, and 500 Gm each They were excluded as having a sufficient causative factor for hypertrophy other than hypertension, even though it is not likely that the extent of deformity is adequate to account completely for the amount of hypertrophy Two other cases had normal valves and weighed 390 and 400 Gm. each

Whether coronary sclerosis alone can cause cardiac hypertrophy is open to final decision Blood flow through the coronary vessels may conceivably be reduced sufficiently to cause ischemic weakness and increased stretching of the muscle in diastole, an effective stimulus to hypertrophy Kahn and Ingraham found increased heart weight in cases with moderate or marked coronary sclerosis [14] Shohet *et al* also found cardiac hypertrophy in 122 necropsies in which all other factors responsible for hypertrophy except coronary disease had been eliminated [15] While it may be causative, the extent of hypertrophy is certainly not very great Nathanson reports 45 of 113 cases with marked sclerosis and/or obstruction of the coronary arteries weighing 400 Gm or less [16] Since five of our 19 unknowns with heart weights of 400 Gm. or less showed coronary sclerosis of moderate or marked degree, these were also excluded Thus, 11 of 19 cases can be considered as having probably had a previous hypertension, giving a corrected figure of 78 per cent of the total series with hypertensive hearts Of the remaining eight, three were diabetic, so that of the 37 cases 32 were either hypertensive, diabetic, or both, constituting 86 5 per cent of the total

Acute clinical attacks of myocardial infarction were noted in 23 patients Twenty-two occurred within two weeks before admission and the other within one month In only four were previous attacks reported, these were at two, six, sixteen, and thirty-six months, respectively, before the final attack Most significant is the high mortality rate in this group with the first attack about 50 per cent of the total A history of angina was present in only six cases In three no acute attacks had ever been noted, but in two the electrocardiogram showed myocardial infarction

Electrocardiograms were obtained in 18 cases and in ten were diagnostic of infarction Correlation with pathologic findings was positive in eight of these ten In the other two no evidence of either infarction or occlusion could be found In one case the tracing was made two weeks after the acute clinical attack, while in the other no muscle damage was noted, but 100 cc of pericardial fluid were found, together with signs of cardiac failure In three cases where acute clinical attacks occurred and in which electrocardiograms were not diagnostic, the tracings were made less than one week after the acute episode The possibility that the tracing was made too early to show damage to the myocardium seems logical in some of our cases and is not the prime reason for the inconsistencies It is often difficult to account for such electrocardiographic changes which occur in the absence of pathology unless it is borne in mind that chemical changes in the muscle may be reflected as changes in conduction and are not visible microscopically

Old infarctions were found in nine cases with added recent infarcts in four, causing death Of the other five, two died of pulmonary infarction due to embolism or thrombosis, one of diffuse peritonitis resulting from rupture of a diverticulum of the colon, one of a cerebral vascular accident, probably originating from a thrombus in an old ventricular aneurysm (cardiac), and the fifth case died of acute cardiac failure

In general, the distribution of lesions has been similar to that found by many other investigators The distribution in 24 cases in which fresh occlusions were found is indicated in Table 2

TABLE 2.—DISTRIBUTION OF LESIONS IN 24 CASES WITH FRESH OCCLUSIONS

In four other cases in which old healed occlu-

but may be related to the comparative incidence of atherosclerosis Willius found an increase in blood lipoids in women with coronary disease [3] He suggested that, since the storage of lipoids is increased during pregnancy, the mechanism of lipoid metabolism might be more efficient and so account for the lowered tendency to vascular sclerosis He also found coronary sclerosis in 33 6 per cent of men and in only 18 8 per cent of women in consecutive necropsies, while De Porte in a study of heart disease found coronary sclerosis in 23 7 per cent of 893 men and in only 16 per cent 933 women [7]

Diabetes mellitus was present in nine of the 37 cases (24 3 per cent), with ages ranging from fifty-seven to seventy-six years, averaging sixty-six and seven-tenths years as compared with the total average of sixty-seven and seven-tenths years Old occlusions were found in two recent infarction in seven of these patients Four of the nine had an associated previously known hypertension Of these, three showed recent infarction The other case showed only myocardial fibrosis along the course of coronary vessels which were markedly narrowed by atherosclerosis At one point sclerosis completely occluded the vessel The heart weighed 460 Gm and was heavier than the other three (300, 300, and 400 Gm , respectively) This high incidence of diabetes is in accord with the statistics of many other observers Coronary sclerosis is found with greater frequency in diabetics than in nondiabetics *Root studied the coronary vessels* of 316 diabetics over forty years of age and found occlusion in 38 2 per cent of men and in 32 per cent of women as compared with the figures 9 9 per cent for men and 4 9 per cent for women in 152 nondiabetics [8] Enklewitz found coronary occlusion in 31 8 per cent of 261 diabetics [9] Stearns found coronary sclerosis in all of 50 diabetics, of whom 31 were women, and in only 37 per cent of nondiabetic controls [10] He also noted occlusions in 19 of 31 diabetic women and in only 11 of 145 nondiabetic women In Master's series of 112 women with coronary occlusion, 26 8 per cent has diabetes [2] It is apparent that the occurrence of diabetes in women has a statistical significance in susceptibility to coronary occlusion

In a hospital serving an economically poor section of the city, such as that under consideration, many patients are admitted in extremis, and complete accurate histories are often difficult to obtain Without a history of hypertension it is frequently impossible to determine whether the blood pressure of a patient in shock was previously elevated The incidence of hypertension in our series is, therefore, a conjectural rather than an absolute value Eighteen of the 37 patients (48 6 per cent) were definitely hypertensive at some time prior to admission, considering a systolic level over 145 mm and a diastolic over 95 as abnormal The remaining 19 cases were carefully studied for such evidences which could be considered as pointing to previous hypertension. For the purpose of simplicity, this group will be referred to as "unknowns," while those with definite hypertension will be called "knowns" The average heart weight of the "known" groups was 464 Gm with a range of 300 to 690 Gm., while the "unknowns" ranged from 300 to 600 Gm with an average of 441 Gm Little difference existed in the age groupings, except that three of the "unknowns" and only one of the "knowns" fell in the eighty-one to ninety group

Several factors were analyzed Cardiac hypertrophy can safely be assumed only when the heart weight greatly exceeds normal, since normal values in themselves are difficult to evaluate Body height and weight have been correlated with cardiac weight, and a wide range of normals has been reported in various series The only accurate method is to measure individual muscle fibers, and, since this was not done, heart weight must be relied upon for our survey Zeek studied the weight of the normal heart in 224 women and found a variation from 150 to 374 Gm.[11] He cites figures from other analyses in which the combined variations are from 110 to 367 Gm. with a combined average of 263 Gm. It would then seem reasonable to consider any heart weighing more than 400 Gm as definitely hypertrophied, *although Peery used 500 Gm as the* upper limit of normal in his study [12] Five of our unknowns had hearts weighing 500 Gm or more, ten others weighed between 400 and 500 Gm which placed 15 of the 19 in the category of hypertrophied hearts Using Zeek's tables, in which he correlated body length with heart weight in normal individuals, we obtained for the remaining four cases the figures shown in Table 1 Accordingly, we can consider all 19 of our unknowns as having cardiac hypertrophy

TABLE 1 —CORRELATION OF BODY LENGTH WITH HEART WEIGHT IN FOUR CASES ACCORDING TO ZEEK'S TABLES

Case Number	Body Length (Cm.)	Estimated Heart Weight (±30 Gm.)	Actual Weight
6	152	249	300
25	162	267	350
29	145	236	350
9	166	274	390

Many factors other than hypertension can increase cardiac weight No evidences of significant amounts of edema fluid or inflammatory exudate was found in these hearts In the four borderline cases mentioned above, one showed myocardial fibrosis with several areas of necrosis of muscle bundles, chronic passive congestion,

and mild pulmonary edema Another had a flabby fibrotic myocardium with bronchopneumonia and 200 cc of fluid in the left pleural sac The third had a large infarct with bloody pericardial fluid, and the fourth had an infarct with myocardial fibrosis, mild pulmonary edema, and cardiac failure

The effect of calcific disease of the aortic valve on heart weight was studied by Karsner and Koletsky and in 200 cases the average heart weight was 512 Gm.[13] Where calcific valvular lesions existed without deformity, the average weight was 453 55 Gm and rose to 529 Gm if deformity or stenosis were present Simple calcification of the aortic valve, therefore, is not to be considered a significant cause of more than slight hypertrophy unless associated with deformity In our 19 unknowns the description of the valves included the presence of thickening, calcification, and fusion of the commissures Whether sufficient fusion existed to cause actual stenosis could not be ascertained in most of the reports Only three were labeled "fusion," and their weights were 550, 430, and 500 Gm each They were excluded as having a sufficient causative factor for hypertrophy other than hypertension, even though it is not likely that the extent of deformity is adequate to account completely for the amount of hypertrophy Two other cases had normal valves and weighed 390 and 400 Gm. each.

Whether coronary sclerosis alone can cause cardiac hypertrophy is open to final decision Blood flow through the coronary vessels may conceivably be reduced sufficiently to cause ischemic weakness and increased stretching of the muscle in diastole, an effective stimulus to hypertrophy Kahn and Ingraham found increased heart weight in cases with moderate or marked coronary sclerosis [14] Shohet *et al* also found cardiac hypertrophy in 122 necropsies in which all other factors responsible for hypertrophy except coronary disease had been eliminated.[15] While it may be causative, the extent of hypertrophy is certainly not very great Nathanson reports 45 of 113 cases with marked sclerosis and/or obstruction of the coronary arteries weighing 400 Gm. or less [16] Since five of our 19 unknowns with heart weights of 400 Gm. or less showed coronary sclerosis of moderate or marked degree, these were also excluded Thus, 11 of 19 cases can be considered as having probably had a previous hypertension, giving a corrected figure of 78 per cent of the total series with hypertensive hearts Of the remaining eight, three were diabetic, so that of the 37 cases 32 were either hypertensive, diabetic, or both, constituting 86 5 per cent of the total

Acute clinical attacks of myocardial infarction were noted in 23 patients Twenty-two occurred within two weeks before admission and the other within one month In only four were previous attacks reported, these were at two, six, sixteen, and thirty-six months, respectively, before the final attack Most significant is the high mortality rate in this group with the first attack about 50 per cent of the total A history of angina was present in only six cases In three no acute attacks had ever been noted, but in two the electrocardiogram showed myocardial infarction.

Electrocardiograms were obtained in 18 cases and in ten were diagnostic of infarction. Correlation with pathologic findings was positive in eight of these ten In the other two no evidence of either infarction or occlusion could be found In one case the tracing was made two weeks after the acute clinical attack, while in the other no muscle damage was noted, but 100 cc of pericardial fluid were found, together with signs of cardiac failure In three cases where acute clinical attacks occurred and in which electrocardiograms were not diagnostic, the tracings were made less than one week after the acute episode The possibility that the tracing was made too early to show damage to the myocardium seems logical in some of our cases and is not the prime reason for the inconsistencies It is often difficult to account for such electrocardiographic changes which occur in the absence of pathology unless it is borne in mind that chemical changes in the muscle may be reflected as changes in conduction and are not visible microscopically

Old infarctions were found in nine cases with added recent infarcts in four, causing death. Of the other five, two died of pulmonary infarction due to embolism or thrombosis, one of diffuse peritonitis resulting from rupture of a diverticulum of the colon, one of a cerebral vascular accident, probably originating from a thrombus in an old ventricular aneurysm (cardiac), and the fifth case died of acute cardiac failure

In general, the distribution of lesions has been similar to that found by many other investigators The distribution in 24 cases in which fresh occlusions were found is indicated in Table 2

TABLE 2.—DISTRIBUTION OF LESIONS IN 24 CASES WITH FRESH OCCLUSIONS

	Number of Cases
Left coronary artery	18
Anterior descending branch	13
Descending branch of circumflex	2
Posterior descending branch	2
Branch not specified	1
Right coronary artery	5
Not specified	1

In four other cases in which old healed occlu-

sions were noted, two were in the left, one in the right coronary artery, and in one the location was not specified In four cases occlusion was by calcification alone without thrombosis In eight cases, of which six were recent and two old, infarction was present without occlusion In one other case an old occlusion was found without any area of infarction, recent or old

Thrombi were found attached to the endocardial surface 11 times in the ventricle alone in eight cases, in the right auricular appendage in two, and in both ventricle and auricle in one In six of these cases no embolization occurred Infarction was noted in organs other than the heart in 13 cases In four of these ventricular thrombus was present, and three were in auricular fibrillation before death Infarcts were found in the lungs and kidney in the case containing both ventricular and auricular thrombi with regular cardiac rhythm Both cases with auricular thrombi only, one of which was in auricular fibrillation, showed distant embolizations In the remaining six cases no origin for the distant infarcts could be found in the heart, although two of these also showed auricular fibrillation Therefore, auricular fibrillation and/or mural thrombus accounted for nine of the 13 cases with distant infarction In the remaining four, pulmonary infarcts were found in three cases and cerebral thrombosis in one Both lesions could have resulted from local stasis Mural thrombus or infarcts in distant organs were found in 17 of the 37 cases (46 per cent) In the series reported by Nay and Barnes, 37 per cent of 100 cases of coronary occlusion and/or myocardial infarction showed thrombotic or embolic manifestations [17] The distribution of such lesions in our cases is seen in Table 3 The high frequency of this complication seems to favor the routine early use of anticoagulant therapy in myocardial infarction

TABLE 3.—Distribution of Thrombotic or Embolic Manifestations in this Series

Location	Number of Cases
Pulmonary	9
Abdominal aorta	1
Superior mesenteric artery	1
Cerebral	3
Spleen	2
Kidneys	3
Thrombophlebitis	1

Large amounts of pericardial fluid are infrequent in myocardial infarction unless hemorrhage occurs Some effusion probably occurs since the friction rub so commonly heard disappears fairly rapidly Normally, up to 50 cc of free fluid may be found in the pericardial sac In the 26 cases in which mention of fluid was made, less than 50 cc was present in 14, between 50 and 200 cc was found in 11, and more than 200 cc in one Six of these effusions were bloody, two as a result of rupture of the ventricular wall, and in the other four due to oozing from fresh hemorrhagic infarction It is likely that cardiac failure in the other five might have contributed to the effusion The infrequent presence of pericardial effusion in this series is in keeping with other reports

The association of biliary tract disease with coronary disease has been the object of much research since 1878 Various views have been held cholecystitis predisposes to coronary sclerosis, cardiac lesions increase the incidence of cholelithiasis, cholecystectomy for cholelithiasis can result in improvement of angina and reversal of electrocardiographic changes in some cases The more conservative viewpoint is that cholelithiasis will cause anginal manifestations only where some coronary sclerosis with insufficiency already exists Breyfogle found gallbladder disease in 363 of 1,493 consecutive autopsies (24.3 per cent) and in 79 of 162 cases of coronary disease (42 4 per cent), demonstrating the increased incidence in association between gallbladder and coronary disease [18]

In our series, the presence of biliary calculi was noted in 12 instances (32 4 per cent) Diabetes was present in four (33 3 per cent), which is a greater incidence than was noted for the entire group (24 3 per cent) Whether the same disturbance in fat metabolism is responsible for coronary sclerosis and for the formation of calculi in these women is a subject for further investigation One fact appears evident The presence of biliary calculi must not be relied upon entirely to explain manifestations of coronary heart disease We have been unable to ascertain whether clinical symptoms related to biliary colic were present in our patients during life It seems unlikely that cholecystectomy would have affected the course of the cardiac disease in this group

Discussion

We have presented an analysis of the necropsy findings in 37 women in whom the cause of death included a diagnosis of myocardial infarction and/or coronary occlusions The age distribution coincided with that reported by many others, with the average age being approximately ten years more than that found in men. The reason for this difference is still not determined, although the theory of a better metabolic utilization of lipoids in women is the most widely quoted Dock's theory seems more likely [19] He studied the coronary vessels in 12 male and 12 female infants less than one day old and found the intima in the male about three times thicker than in the female, with an intima-

media ratio of 26 per cent in the male and 8 per cent in the female He believes the predilection of atherosclerosis for the male coronary vessels depends on this congenital difference Minkowsky repeated this study in infants more than one day old and corroborated Dock's findings [20] In addition, he reported areas of intimal thickening with a distribution similar to that found in the adult arteriosclerotic lesion in the coronary vessels These findings point to an anatomic difference in the vessels of the sexes which may in part explain the clinical difference noted in later life When, in addition, the metabolism is disturbed by diabetes with its tendency to produce early atherosclerosis, or if hypertension occurs with its production of vascular thickening, the incidence of coronary artery disease increases at a more rapid rate than would occur under normal aging processes in the female

The relatively rare incidence of angina was surprising Further studies are in progress in a larger series of nonautopsied cases of women with coronary occlusion which may not bear out these figures It is difficult at this time to give any fully satisfactory explanation. Since most of these women were in the higher age groups and probably confined their activities to housework, their coronary insufficiency may not have been induced as frequently as it might in a man required to perform more arduous physical tasks in earning a livelihood We are also inclined to question the accuracy of certain histories where more time and skill in questioning would have differentiated digestive from coronary complaints more accurately Finally, the high mortality with the *first attack of myocardial* infarction may have lowered the incidence of longstanding relative ischemia which usually causes angina.

We wish to emphasize again the high incidence of cholelithiasis in these cases of acute myocardial infarction because of the tendency in recent years to minimize the signs pointing to coronary disease in women in whom x-rays reveal calculi Although a number of patients have had relief of anginal symptoms following cholecystectomy, great diagnostic skill is frequently required to assign the proper significance to the symptoms observed. The higher incidence of association of these two conditions suggests a common denominator in the cause It would be more prudent to consider a woman with cholelithiasis and symptoms of coronary disease as a more likely candidate for infarction than to take the reverse, more optimistic stand. However, we do not object to cholecystectomy in very carefully selected cases

Our figures relating to the occurrence of thrombi both in the heart and in other organs and embolization resulting therefrom show a high incidence In a large number of our cases death was probably hastened, if not entirely caused, by embolization, and the prevention of such accidents by anticoagulants could be a valuable aid in reducing at least the immediate mortality Recent trends in the wider use of anticoagulants in routine treatment of myocardial infarction have produced large series of cases with results which favor such therapy

Summary

1 An analysis is presented of the findings in 37 women in whom necropsy revealed coronary occlusion and/or myocardial infarction.

2 Their ages ranged from forty-seven to eighty-seven years, with an average of sixty-seven and seven-tenths years This coincides with the findings in other surveys which indicate that coronary artery disease in women occurs a decade later than in men.

3 Diabetes mellitus was found in 24 3 per cent, hypertension in 78 per cent, and either or both in a total of 86 5 per cent The significance of this finding is discussed

4 Death followed the first attack in more than 50 per cent A history of anginal pain was rarely obtained, occurring in only six patients

5 The site and age of infarction were tabulated In general, the distribution of lesions in the coronary vessels follows the usual pattern of predominantly left coronary artery involvement The frequency of thrombus formation in the endocardium with embolic manifestations has been emphasized, having been noted in 46 per cent of this series

6 The occurrence of cholelithiasis in 12 cases points to a disturbance in fat metabolism as a possible common denominator in its association with diabetes mellitus, hypertension, and atherosclerosis

7 Coronary artery disease in women differs from that in men in many respects, as indicated above A further study of these factors may point the way to clarification of the etiology of a process which has taken increasing death toll in recent years

5 Dublin, L. I. Diseases of Coronary Arteries and

sions were noted, two were in the left, one in the right coronary artery, and in one the location was not specified In four cases occlusion was by calcification alone without thrombosis In eight cases, of which six were recent and two old, infarction was present without occlusion In one other case an old occlusion was found without any area of infarction, recent or old

Thrombi were found attached to the endocardial surface 11 times in the ventricle alone in eight cases, in the right auricular appendage in two, and in both ventricle and auricle in one In six of these cases no embolization occurred Infarction was noted in organs other than the heart in 13 cases In four of these ventricular thrombus was present, and three were in auricular fibrillation before death Infarcts were found in the lungs and kidney in the case containing both ventricular and auricular thrombi with regular cardiac rhythm Both cases with auricular thrombi only, one of which was in auricular fibrillation, showed distant embolizations In the remaining six cases no origin for the distant infarcts could be found in the heart, although two of these also showed auricular fibrillation Therefore, auricular fibrillation and/or mural thrombus accounted for nine of the 13 cases with distant infarction In the remaining four, pulmonary infarcts were found in three cases and cerebral thrombosis in one Both lesions could have resulted from local stasis Mural thrombus or infarcts in distant organs were found in 17 of the 37 cases (46 per cent) In the series reported by Nay and Barnes, 37 per cent of 100 cases of coronary occlusion and/or myocardial infarction showed thrombotic or embolic manifestations [17] The distribution of such lesions in our cases is seen in Table 3 The high frequency of this complication seems to favor the routine early use of anticoagulant therapy in myocardial infarction

TABLE 3.—Distribution of Thrombotic or Embolic Manifestations in this Series

Location	Number of Cases
Pulmonary	9
Abdominal aorta	1
Superior mesenteric artery	1
Cerebral	3
Spleen	2
Kidneys	3
Thrombophlebitis	1

Large amounts of pericardial fluid are infrequent in myocardial infarction unless hemorrhage occurs Some effusion probably occurs since the friction rub so commonly heard disappears fairly rapidly Normally, up to 50 cc of free fluid may be found in the pericardial sac In the 26 cases in which mention of fluid was made, less than 50 cc was present in 14, between 50 and 200 cc was found in 11, and more than 200 cc in one Six of these effusions were bloody, two as a result of rupture of the ventricular wall, and in the other four due to oozing from fresh hemorrhagic infarction. It is likely that cardiac failure in the other five might have contributed to the effusion The infrequent presence of pericardial effusion in this series is in keeping with other reports

The association of biliary tract disease with coronary disease has been the object of much research since 1878 Various views have been held cholecystitis predisposes to coronary sclerosis, cardiac lesions increase the incidence of cholelithiasis, cholecystectomy for cholelithiasis can result in improvement of angina and reversal of electrocardiographic changes in some cases The more conservative viewpoint is that cholelithiasis will cause anginal manifestations only where some coronary sclerosis with insufficiency already exists Breyfogle found gallbladder disease in 363 of 1,493 consecutive autopsies (24 3 per cent) and in 79 of 162 cases of coronary disease (42 4 per cent), demonstrating the increased incidence in association between gall bladder and coronary disease [18]

In our series, the presence of biliary calculi was noted in 12 instances (32 4 per cent) Diabetes was present in four (33 3 per cent), which is a greater incidence than was noted for the entire group (24 3 per cent) Whether the same disturbance in fat metabolism is responsible for coronary sclerosis and for the formation of calculi in these women is a subject for further investigation One fact appears evident The presence of biliary calculi must not be relied upon entirely to explain manifestations of coronary heart disease We have been unable to ascertain whether clinical symptoms related to biliary colic were present in our patients during life It seems unlikely that cholecystectomy would have affected the course of the cardiac disease in this group

Discussion

We have presented an analysis of the necropsy findings in 37 women in whom the cause of death included a diagnosis of myocardial infarction and/or coronary occlusions The age distribution coincided with that reported by many others, with the average age being approximately ten years more than that found in men The reason for this difference is still not determined, although the theory of a better metabolic utilization of lipoids in women is the most widely quoted Dock's theory seems more likely [19] He studied the coronary vessels in 12 male and 12 female infants less than one day old and found the intima in the male about three times thicker than in the female, with an intima-

two days. Examination revealed a semicomatose woman whose face was flushed and whose skin was moist. Temperature was 97.8 F. by rectum, pulse 140 per minute, respirations 36 per minute, shallow and rapid, and blood pressure was 100/80. Pupils were normal, neck was stiff, Kernig and Brudzinski signs were positive, deep reflexes were active and equal, Babinski signs were negative, and sensory status was intact. There was no evidence of motor impairment. Adrenalin by hypodermic injection, ephedrine sulfate by mouth, and calcium gluconate intravenously relieved the symptoms within one-half hour. On the next day she developed generalized urticaria which cleared up two days later without any other untoward symptoms.

This patient represents the usual type of reaction to tetanus antitoxin accompanied, however, by a form of meningismus, undoubtedly on an allergic basis. The syndrome of fever, chills, adenopathy, arthralgia, and urticaria usually manifests itself about five to seven days after the injection of serum. Lyall and Murdick in an analysis of 1,000 cases receiving New York State tetanus antitoxin showed that general reactions were much greater in those persons with a history of previous injection of serum than in those with no such history.[1] The incidence was 36.6 per cent in the former as compared to 18.2 per cent in the latter. This case belongs to the series of patients who had not received any previous serum and is classified as serum disease.

Case 2.—F. M., age forty-five, a white man, stepped on a nail on May 27, 1942, inflicting a puncture wound on the left foot. The wound was taken care of in the usual manner, and because the skin test with New York State tetanus antitoxin was markedly positive no serum was given. The following day the right forearm, at the site of the skin test, became very swollen, red, hot, indurated, and did not pit on pressure. This swelling increased tremendously so that on May 29 it extended from his shoulder down to the tips of his fingers. He also began to complain of marked local pruritus. Temperature, pulse, and respiration remained normal. Bed rest, elevation of the arm, Burow solution wet dressings, and 7 minims of adrenalin hypodermically every four hours finally brought the swelling down to normal three days later.

This case represents the most marked local reaction to a skin test with tetanus antitoxin that I have ever seen or, probably, that has ever been reported in the literature. Although he had never received any previous injections of serum or antitoxin, he had formerly been a dealer of horses and had had to give up his trade because of so-called "eczema" resulting from the handling of the horses.

Case 3.—L. T., age thirty-eight, a white man, cut the dorsum of his right index finger with a machine tool on May 12, 1943. The wound was cleansed and, after a negative skin test, 1,500 units of New York State tetanus antitoxin were given subcutaneously. Five days later he developed axillary adenitis and urticaria. This was relieved within three days, following several injections of adrenalin. On May 20, the patient complained of severe sharp pain in the right arm which was not relieved by sedation. The pain became worse and involved the entire right shoulder girdle radiating to the side of the neck and to the occiput. This was accompanied by an inability to use the arm. Temperature, pulse, and respiration remained normal. The pathology was limited to the right shoulder girdle. The arm hung limply at the side and could not be abducted or rotated outward. There was loss of pinprick sensation on the outer side of the arm. The biceps, brachioradialis and brachialis anticus muscles were flaccid and showed occasional fibrillary twitchings. Biceps jerks were absent on the right side. Flexion at the elbow was absent, but movement of the hand and fingers was normal. Spinal tap was normal, but a mild blood eosinophilia of 8 per cent was present. The marked pain disappeared after six hours, leaving a mild ache for about two days. Full power in the right shoulder girdle returned to normal two weeks after the onset.

This case represents an Erb Duchenne type of involvement of the brachial plexus, namely, the fifth and sixth cervical roots. This is the most frequent type of polyneuritis following an injection of tetanus antitoxin. Most of these cases of radiculitis have been reported from the continent, chiefly France.[2-6] To date a little over a hundred cases have been reported in the literature. Peculiarly enough, the right shoulder girdle is involved more often than the left. It is more apt to occur in individuals who had serum injections previously and in adults rather than children. According to Chavany and Askenazy, the amount of serum injected plays no part in the ensuing reaction.[2] The prognosis is usually good, but the more severe cases may persist for one to two years.

Every physician has had cases which have developed some form of reaction to tetanus antitoxin. As a rule, these after-effects are mild and annoying, but at times the reactions are more severe as in cases 2 and 3. There have even been deaths reported on an anaphylactic basis but, fortunately, these cases are rare.

Although the physician should be aware of the different types of reactions to serum, these undesirable side-effects should not deter him from administering the antitoxin to the required cases. With proper desensitization in the sensitive cases and with the use of adrenalin, ephedrine sulfate and like derivatives, and the newer antihistamine drugs, most of these cases can be treated adequately and rapidly.

UNUSUAL REACTIONS TO TETANUS ANTITOXIN

J A MISHKIN, M D , Watertown, New York

(From the Mercy Hospital)

ALTHOUGH tetanus toxoid has come to the fore as a prophylactic and therapeutic agent against tetanus, tetanus antitoxin is still more widely used throughout the world for that same purpose Unfortunately, because of the small number of marked reactions to the antitoxin, much too large a number of medical men have become overcourageous and have administered the antitoxin without a previous test for sensitivity or have not paid adequate attention to the skin test This paper is presented, therefore, as a warning against the further practice of giving tetanus antitoxin without proper delineation of a previously performed skin test

Briefly, it is well known that the antitoxin is derived from the serum of a horse which has previously received a nonlethal dose of tetanus toxin The undue reactions which occasionally appear after inoculation of tetanus antitoxin are due not to the tetanus toxin but to the serum of the horse A large percentage of the population is allergic to horse serum, some individuals more than others and particularly those who have been in contact with horses—farmers, horse dealers, tanners, etc

Allergic reactions to serum may be immediate or delayed, local or general Serum disease which may be expected in about 15 per cent of cases is characterized by the fact that it occurs in normal persons without a history of previous serum injection and that an incubation period is necessary before the development of symptoms Artificial serum allergy is seen in those normal persons who have become sensitized because of a previous injection of serum and may be expected in about 50 per cent of such cases Natural serum allergy occurs in those individuals who give a family history of allergy and is extremely rare, occurring only once in 70,000 serum injections

It is necessary to determine whether or not the patient is sensitive to horse serum, or to bovine serum if the latter is to be employed The history, physical examination, and sensitivity tests assist in diagnosing a state of serum hypersensitivity

Sensitivity tests must be carried out each time serum is to be given. The information supplied by sensitivity tests is valuable but by no means infallible, and the various tests differ in their degree of sensitivity and, therefore, in their practical significance The ophthalmic test, although not so sensitive as the skin test, is a more reliable means of predicting the occurrence of acute reactions On the other hand, the skin tests frequently detect states of sensitivity which are not of clinical significance Obviously, the results of the various tests must be correlated with the history and physical examination

In performing the intracutaneous test, 0 1 ml. of a 1 100 dilution of serum in sterile physiologic salt solution is injected intradermally A positive local reaction consists of an area of edema about 1/2 inch in diameter with a surrounding erythema, frequently with pseudopodia extending from the wheal It is said that the sooner the local reaction appears the greater the sensitivity The size of the reaction does not indicate the degree of sensitivity, merely that sensitivity exists

The ophthalmic test is made by placing a drop of serum diluted 1 10 in the conjunctival sac If redness, burning, and itching occur in ten minutes, a marked state of sensitivity is said to be present

Case Reports

Case 1 —E B , age twenty-seven, a white woman, ran a nail into the lateral aspect of her left foot on November 14 1942 The puncture wound was opened and cauterized After a negative skin test, 1,500 units of tetanus antitoxin were given subcutaneously On November 18 she suddenly developed pain in the back of her neck, enlargement of the axillary glands, chills, and fever She had complained of lethargy and malaise during the preceding

two days. Examination revealed a semicomatose woman whose face was flushed and whose skin was moist. Temperature was 97.8 F. by rectum, pulse 140 per minute, respirations 36 per minute shallow and rapid, and blood pressure was 100/80. Pupils were normal, neck was stiff, Kernig and Brudzinski signs were positive, deep reflexes were active and equal, Babinski signs were negative, and sensory status was intact. There was no evidence of motor impairment. Adrenalin by hypodermic injection, ephedrine sulfate by mouth, and calcium gluconate intravenously relieved the symptoms within one-half hour. On the next day she developed generalized urticaria which cleared up two days later without any other untoward symptoms.

This patient represents the usual type of reaction to tetanus antitoxin accompanied, however, by a form of meningismus, undoubtedly on an allergic basis. The syndrome of fever, chills, adenopathy, arthralgia, and urticaria usually manifests itself about five to seven days after the injection of serum. Lyall and Murdick in an analysis of 1,000 cases receiving New York State tetanus antitoxin showed that general reactions were much greater in those persons with a history of previous injection of serum than in those with no such history.[1] The incidence was 36.6 per cent in the former as compared to 18.2 per cent in the latter. CLINICAL PATHOPHYSIOLOGY OF THERAPEUTIC EXERCISES

HANS KRAUS, M D , New York City

(From the Department of Physical Therapy, Vanderbilt Clinic, Columbia-Presbyterian Medical Center)

EXERCISES have gradually become one of the most important modalities of physical medicine This is mainly due to the fact that they can help to restore or improve function. There are two main groups of therapeutic exercises general therapeutic exercises, the aim of which is to improve metabolism, general muscle status, circulation, breathing, etc , and exercises to improve more or less localized conditions, i e , exercises whose main aim is to affect the muscle status of more or less localized body regions It is this latter group which is to be discussed here This group includes exercises for poliomyelitis, cerebral palsy, posture, traumatic conditions, and local arthritic conditions In other words it includes numerous orthopedic and neurologic and certain medical indications

Therapeutic exercises were introduced to this country by Dr G H Taylor with the publication of his book, *Exposition of the Swedish Movement Cure* While this book presents an over-all view of the various fields in which exercises are used, we are presently in a period of superspecialization The trend toward singling out special systems of exercise therapy for special conditions is very definite It is deplorable that exercise therapy, which can be a valuable part of the therapeutic armamentarium, has been divided into a number of individual therapeutic fields (posture work, cerebral palsy work, infantile paralysis work, traumatic work) This branching off into different fields of exercise therapy has real drawbacks

Physical therapists trained in only one of these fields will be less capable in others They are prone to apply the principles of their own field to whatever problem they may encounter They lose contact with the general problem of muscle development, and the individual "systems" freeze, sacrificing the chance to improve and absorb new progress Furthermore, individual systems tend to develop "followers" who demonstrate an emotional, and almost religious, fervor in the support of their adopted technics

Far-reaching specialization is not possible in small communities A handful of persons or perhaps only a single individual may have to cope with all the problems of therapeutic exercises, and for this reason we need therapists and doctors in physical medicine with good general backgrounds It has, therefore, been our aim to establish common denominators for exercise treatment and its prescription—common denominators which may serve as indications in the various fields of application of therapeutic exercise

We feel that an exercise prescription should be written and filled as accurately as any prescription for a highly potent drug It should be based on proper analysis of the motor deficiency requiring treatment This analysis should not only include a defining of the groups of muscles requiring treatment but the type of muscle deficiency It should include quality and quantity of exercise desired

In an attempt to establish common denominators for an exercise treatment we will carry our analysis of muscle function only to a point where the elements defined can be used directly as a basis for exercise prescription. Anything more complicated would be valueless for such a purpose

For a rough working analysis it will be sufficient to differentiate three functional basic qualities of a muscle (1) muscle power, the ability of the muscle to overcome resistance and to lift or hold weights, according to its ability to contract, (2) elasticity, the ability of the muscle to relax the state of contraction and actively adapt itself to varying lengths without straining its fibers, and (3) coordination, the correct play of muscle power (1) and elasticity (2) relative to a time unit We realize that these basic qualities are a gross oversimplification, but they constitute the three main aspects of muscle action which can be translated directly into an exercise

The leading principle for all exercise work is the fact that the muscle will develop exactly the quality which is demanded by the performance of the particular exercise Thus, if a muscle is called on to lift weights, to increase its contraction, its ability to contract and its power will be increased, if a muscle is made to relax, to give up tenseness, to increase its length, its elasticity will be increased, if a muscle is called upon to function properly in relation to other muscles, its coordination will be improved

Another principle in prescribing therapeutic exercises is the fact that only sufficient repetition of a sufficiently difficult task will cause the muscle to increase whatever property is demanded of it Let us call this requirement "exercise value" Since only a certain number of minutes every day will be available for exercise, it is vital to use all

Presented at a meeting of the New York Society of Physical Medicine, February 4, 1948.

this time for necessary movements and to standardize these movements in order to concentrate on the muscles requiring treatment In most cases it is also important to avoid fatigue and pain

The form of an exercise is the sum total of the following elements muscles involved in the movement, the qualities of muscle function necessary for the movement, the speed of performance, rest periods between performances, range of movement and intensity, and effort employed

Individual Types of Exercise

Power—The maximum weight which can be lifted by a muscle indicates its absolute muscle power The length of time during which this weight can be lifted a consecutive number of times indicates the endurance This period will obviously be longer for a weight that is less than the maximum capacity

Exercises leading to muscle power are those which require the lifting of a weight or the overcoming of resistance which may be represented by the weight, or partial weight, of the body region moved by the muscle Whenever the muscle is too weak to manage the full weight of the body region or when the synergists of a muscle are not able to give it adequate help, outward assistance must be given. This may take the form of support by the hands of a second person, the buoyant effect of water in which the part is immersed, or support by the hands of the patient himself Resistance to the muscle contraction may be provided by some other person or by mechanical device

The quantity of weight to be lifted, the resistance to the movement, and the time of application of the exercise must be increased gradually Experiments registering the maximum weight-lifting capacity of normal persons have shown that the maximum weight that could be lifted was less on the second and third days than on the first The fourth and fifth days brought a gradual increase. It took the subjects of the experiment approximately six days to a week to regain the weight-lifting capacity of the first day of training from then on a gradual gain over the initial capacity was observed

Power-building exercises should, therefore, be on a gradually increasing scale so that the tive phase can be avoided. They should be performed regularly, since exercising once or twice week will barely maintain the status quo As as the patient can return to his daily work, normal use will keep the muscle at the required level of efficiency It must be emphasized, however, that, unless the limb which has been treated quite ready for normal use, there will always be tendency on the part of the patient to favor it, in ich case he will not find the necessary amount of exercise in his daily occupation and will lapse into a lower level of muscle power

Overtaxing muscle power, especially in the initial stage of treatment, will result in discomfort and pain, not only in the affected muscles but often in affiliated muscle groups Muscle spasm will set in or will be increased, and limitation of motion will result

As previously stated, muscle power is based on the ability of a muscle to contract The word contraction is a misnomer, since the main criterion of contraction is not, as the word implies, shortening, but increase of tension of the muscle Contraction can, as a matter of fact, be associated with shortening of the muscle (concentric contraction), or it can be associated with lengthening of the muscle (eccentric contraction), or again no change in length may occur at all (isometric contraction) In isometric contraction no movement results, but the increase of muscle tension may be effective as holding power It is important to be aware of these different types of muscle power-building movements in order to prescribe the right type of therapeutic exercise The following examples will serve to illustrate concentric, eccentric, and isometric forms of contraction.

(*a*) The flexors of the elbow may increase in tension and decrease in length when the elbow is actively flexed This is "concentric" contraction

(*b*) The flexors of the elbow may increase in tension to the maximum of their capacity against an overpowering pull by an outside force in the opposite direction. The elbow will be forced from a flexed to a stretched position in spite of increased muscle tension in the flexors This will result in increased tension and increased length in the elbow flexors This is "eccentric" contraction

(*c*) The flexors of the elbow may be consciously made to increase in tension, as in a muscle setting exercise, without any movement resulting at the elbow and without change in muscle length This is "isometric" contraction

Elasticity—Total elasticity is the ability to give up contraction and to decrease tension, plus the mechanical ability to yield to passive stretching The first, physiologic elasticity—the giving up of contraction (relaxation)—may be observed in three forms, depending on the relation between the length and tension of a muscle These are counterparts to the three forms of muscle contraction described under muscle power Concentric relaxation, in which decrease of tension is associated with decrease of length, is a condition present in a relaxed passive movement in which insertion and origin of the muscle are approxi-

CLINICAL PATHOPHYSIOLOGY OF THERAPEUTIC EXERCISES

HANS KRAUS, M D , New York City

(From the Department of Physical Therapy, Vanderbilt Clinic, Columbia-Presbyterian Medical Center)

EXERCISES have gradually become one of the most important modalities of physical medicine This is mainly due to the fact that they can help to restore or improve function There are two main groups of therapeutic exercises general therapeutic exercises, the aim of which is to improve metabolism, general muscle status, circulation, breathing, etc , and exercises to improve more or less localized conditions, i e , exercises whose main aim is to affect the muscle status of more or less localized body regions It is this latter group which is to be discussed here This group includes exercises for poliomyelitis, cerebral palsy, posture, traumatic conditions, and local arthritic conditions In other words it includes numerous orthopedic and neurologic and certain medical indications

In an attempt to establish common denon tors for an exercise treatment we will carry analysis of muscle function only to a point w the elements defined can be used directly basis for exercise prescription Anything n complicated would be valueless for such a pose

For a rough working analysis it will be suffic to differentiate three functional basic qualities muscle (1) muscle power, the ability of muscle to overcome resistance and to lift or h weights, according to its ability to contract, elasticity, the ability of the muscle to relax state of contraction and actively adapt itself varying lengths without straining its fibers, a (3) coordination, the correct play of mus power (1) and elasticity (2) relative to a time un We realize that these basic qualities are a gr oversimplification, but they constitute the thr main aspects of muscle action which can be tran lated directly into an exercise

The leading principle for all exercise work is th fact that the muscle will develop exactly th quality which is demanded by the performanc of the particular exercise Thus, if a muscle called on to lift weights, to increase its contrac tion, its ability to contract and its power will b increased, if a muscle is made to relax, to give up tenseness, to increase its length, its elasticity wil be increased, if a muscle is called upon to function properly in relation to other muscles, its coordination will be improved

Another principle in prescribing therapeutic exercises is the fact that only sufficient repetition of a sufficiently difficult task will cause the muscle to increase whatever property is demanded of it Let us call this requirement "exercise value" Since only a certain number of minutes every day will be available for exercise, it is vital to use all

Presented at a meeting of the New York Society of Physical Medicine, February 4, 1948.

SURFACE-ACTIVE SOLVENTS IN TOPICAL ANTIBIOTIC THERAPY

EDWIN J GRACE, M D , Brooklyn, New York and VERNON BRYSON, Ph D ,*
Cold Spring Harbor, New York

(From the Grace Clinic and the Biological Laboratories, Cold Spring Harbor)

WE HAVE shown in a series of previous publications that improved clinical results may often be obtained if therapeutic measures are directed toward increasing topical contact between bacterial pathogens and an appropriate antibiotic.[1-4] To this end the use of 100 ml of 0 1 per cent dioctyl ester of sodium sulfosuccinate (aerosol O T) as a solvent for 1,000,000 units of penicillin was designed to further the penetration of the antibiotic into osteomyelitis lesions The arrest of drainage in cases of chronic osteomyelitis, previously treated unsuccessfully by almost all conventional methods led to a more extended investigation of this simple and conservative method of treatment It was observed that the activity of penicillin was greatly enhanced in the presence of aerosol O T or zephiran chloride, aqueous solution, surface-active synergists.**

Particularly important in multiple chemotherapy is the probable lack of opportunity for the development of resistant bacterial strains as observed in correlated laboratory studies and as found by other investigators[4] Since the great problem of resistant bacterial strains is assuming increased clinical significance, attention must be directed toward the manner of origin and the control of resistant organisms All patients treated with a single antibiotic will not necessarily develop resistant strains, but the opportunity for such an occurrence becomes increasingly great as patients with chronic, protracted, suppurative disease continue from day to day on inadequate regimes of penicillin or streptomycin

Failure to understand the few elementary concepts concerning the origin and control of resistant forms of bacteria may, in fact, seriously diminish the efficiency of therapy These simple concepts may be summarized as follows Resistant bacteria originate spontaneously by a process of mutation, or genetic change, and a few of them may be found in any large collection of so-called sensitive cells Their origin does not depend on the presence of a drug against which resistance is acquired Resistant strains are found after prolonged programs of therapy merely because the therapeutic drug may act as a selective agent, eliminating the sensitive cells but incapable of eradicating the more resistant variants The chance that resistant bacteria will arise is greatly reduced if more than one antibacterial agent is used By the simultaneous use of several antibiotic or germicidal substances any cell which becomes resistant to one component will remain vulnerable to another component, providing the modes of action of different components are sufficiently specific so that no overlapping protection is afforded by a genetic change The activity of penicillin in vitro is synergistically enhanced by the presence of some detergents. We have observed a definite synergism of penicillin with 9-amino acridine hydrochloride and streptomycin using Staphylococcus aureus among other test organisms

With these principles of the control of resistance in mind, together with the obvious advantages of synergism and reduced surface tension apparent in antibiotic detergent solutions, we have used surface-active antibiotic solutions by inhalation or local application in a variety of clinical problems with the results to be reported

In presenting the following cases, we would like to emphasize that each of these patients has previously had the benefit of all modern forms of therapy with unsatisfactory results The present cures now obtained must, therefore, be entirely credited to the above-mentioned plan of therapy The potential magnitude of this relatively simple method for coping immediately with the numerous problems of pulmonary tuberculosis is clearly obvious, and all forms of collapse therapy should be re-evaluated in the light of these data

Chronic Osteomyelitis

It would seem at least possible to assume that we would obtain enhanced penetration of osteomyelitic lesions by using a detergent solvent with penicillin in infected bone in humans Nevertheless, a fundamental of this entire problem of topical therapy for all suppurative disease was predicated on our experimental work on the freshly excised femur of rabbits in which was observed the enhanced penetration of 0 1 per cent methyl green in surface-active solution Therefore, we felt that curing hopeless cases of chronic osteomyelitis in humans would represent a very firm

** Zephiran chloride is a mixture of high molecular alkyldimethylbenzyl ammonium chlorides.

mated Eccentric relaxation is release of tension combined with increase in length, the common procedure in normal active movement Isometric relaxation is the release of tension without a corresponding increase in length No movement results, but the tension of the muscle is decreased The following are examples of the three forms of muscle relaxation

(*a*) The flexors of the elbow may be consciously fully relaxed or decontracted while the elbow is passively carried from a position of extension This is "concentric decontraction" (concentric relaxation)

(*b*) The flexors of the elbow may be relaxed (decontracted) and lengthened when the elbow is being stretched from a flexed position to full extension This is "eccentric decontraction" (eccentric relaxation)

(*c*) The flexors of the elbow may be consciously fully relaxed without any movement at the elbow joint and without change in muscle length This is "isometric decontraction" (isometric relaxation)

Physiologic elasticity may be diminished by impairment of a muscle's ability actively to release tension This is the case in spasticity caused by lesion of the upper motor neuron The muscle reacts to an excess of stimuli reaching it via the spinal cord by contracting It does not relax when its antagonists contract but responds to contractions of its antagonists with contraction Normally, a muscle should give up contraction, even before the antagonist contracts, and thereby release motion In a case of spasticity such as found in hemiplegia, spinal cord lesions, and in the spastic types of cerebral palsy, relaxation is the first aim

An entirely different approach is necessary in a case of painful muscle spasm such as is seen in acute trauma or infantile paralysis Here, relief of pain is the first step toward normal Only after local relief of pain has been obtained is the second step taken In other words, the first step consists of an attempt to release contraction through low-grade local relaxation exercises

If the elasticity of a muscle is diminished in a physical sense, that is, if the muscle is physically foreshortened, this state must be treated with active or passive stretching of the muscle contracture

When giving power-building exercises as well as exercises to increase elasticity and coordination, the need for a warm-up must be considered Recently, it has been shown that a muscle does not function with maximal efficiency unless warmed up by work or deep heat to a slightly lesser extent This has been shown by measuring the muscle temperature and at the same time comparing the efficiency in a series of normal persons

Coordination —Coordination is the well-timed and well-balanced aggregate functioning of several muscles in a given movement The function of a group of muscles is well balanced if the necessary degree of contraction is matched by an adequate degree of decontraction in the antagonists

Normal movements of joints are produced by the concerted action of several muscles The actions of these muscles consist of contractions of one group and decontractions of another Changes of muscle length and tone occur in varying degrees The simplest movement, therefore, is a combination of many different muscle actions by several muscles and groups of muscles. This combination of muscle actions constitutes a movement pattern.

In all the previously described disturbances of muscle power and/or elasticity, the affected muscle will not be able to cooperate in a well-timed and well-balanced way with its synergists and antagonists If its dysfunction is of minor degree, this disability may be hidden by other compensating muscles When it is severe enough to be apparent, it results in poor or lacking coordination—incoordination This incoordination will be more obvious as the movement patterns become more complicated

With power and elasticity perfect, coordination can still be impaired if timing and quantitative cooperation of some muscles are not functioning correctly Lesions of the central nervous system and of the organs of equilibration are possible causes for this malfunction If motor patterns cannot be established or have been forgotten, the symptoms of "incoordination" may be apparent This is true physiologically when learning new skills

Conclusion

It is difficult at this time to establish a satisfactory scientific approach for therapeutic exercises It is, however, entirely possible to establish a few common denominators for the whole field of therapeutic exercises on the basis of known physiologic and pathologic facts While these common denominators cannot be considered final, they may have a temporary value as a clinical approach for the prescription of therapeutic exercise They constitute an attempt to give a rational approach to exercise therapy and to avoid overspecialization in the various subdivisions

aqueous solution, 1 1,000 Five milliliters of Sulmefrin or Neosynephrine are inhaled first to aid in the opening of the bronchioles, thus facilitating the deposition of the antibiotic mist into the periphery of the lung Patients are instructed to exhale very forcibly so that they may inhale deeply the aerosolized mist into the terminal bronchi and bronchioles The mist is then deeply inhaled through the mouth every six hours for the first twenty-four hours and then every eight hours night and day for two to four weeks If the patient complains, we may stop inhalation entirely for a few days and then start again. The final steps consist of washing the aerosolizer with 1 ml of physiologic saline and inhalation of this solution As a motivating agent we have used oxygen running at the rate of 5 to 7 L. per minute, although simpler and less expensive methods can easily be devised

The patient is also injected daily with 1 Gm of streptomycin and 300,000 units of penicillin, the latter dissolved in an appropriate solvent to maintain an adequate therapeutic blood level We feel that the combination of the two antibiotics mildly supplements systemically the synergistic therapy in the lung Experimental evidence exists showing that a synergism occurs when streptomycin and penicillin are combined, and the clinical value is obvious The amount of streptomycin administered never exceeded 60 Gm. We have not encountered permanent eighth nerve damage or any other severe complications Some apparently mild allergic reactions were satisfactorily controlled by histamine drugs

We believe that the most valuable element in this plan of therapy is noted above, but, nevertheless, we have augmented therapy systemically with the following liver and vitamin B parenterally, three times a week, vitamins B and C, liver and iron preparation, protein hydrolysates, vitamin K—Menadione—2 mg daily, and Staticin, 4 Gm every quarter hour, night and day for the first forty-eight hours

Vitamin K is given in the hope that it may aid in the production of fibrosis Although the exact nature of the action whereby Vitamin K will increase the prothrombin time is not known, nevertheless, we feel it may be therapeutically helpful With the administration of Staticin, 4 Gm, we may obtain, at the very onset, a higher penicillin level which will aid in the destruction of bacteriologic invaders secondary to the Mycobacterium tuberculosis The importance of liver damage in pulmonary tuberculosis has too often been overlooked We consequently have a well-balanced routine diet to keep protein and carbohydrate intake high and fats moderately low Our first considera therapy is the lung and, following this, th

Case 6—This patient had tuberculosis years duration Routine therapy was ineff The patient was first seen in December, 194 massive hemorrhage and evidence of disea gressing Routine therapy to control hemo was started In January, 1947, when hem was under control, inhalation therapy s Within one month, cavity had diminished co ably At the end of three months, the cav disappeared, sputum was negative, and al laboratory data were within normal limits cultures every two months have been consi negative

Case 7—The first positive tuberculosis s from this patient was seen in October, 1946 gen examination showed bilateral tuber Right pneumothorax was begun in Nov 1946 Aerosol inhalation therapy started in 1947 After cessation of therapy, tempora ralysis of right diaphragm by crushing nerve was done. By the end of April, 194 tums were negative To date, there have b negative sputums and four negative gastric c

Case 8—A twenty-one-year-old woman good health until December, 1946, when she c up blood. She was immediately hospitalize no diagnosis made. In June, 1947, there second episode of coughing up blood The sis was pulmonary tuberculosis of right side was no therapy until the patient was seen by the first time in September, 1947, with a diag advanced tuberculosis with cavitation of th lung The patient was hospitalized imme Inhalation therapy was carried out for three and stopped because of complaint of pain in midportion of chest. There was a satisfact covery After cessation of therapy, tem paralysis of right diaphragm by crushing the nerve was done Cough promptly subsided tums became negative and have remained so gastric analyses were negative

Case 9—This was a patient with a hist pulmonary tuberculosis for one year with em following pneumothorax associated with bi pleural fistula Inhalation therapy was ins in November, 1946, along with permanent pa of right diaphragm by excision of about 2 to 3 phrenic nerve. The patient has been follow twenty months and is progressing satisfa Sputums and gastric analyses are consistentl tive

Case 10—This patient first coughed up b the summer of 1941 and had an acute resp attack in February, 1942 Sputum was p In the same month the patient suffered large rhage Right pneumothorax was begun and factory collapse was obtained Sputum was tive in May, 1942 and remained negative fo years, the patient being entirely symptom-f two years with a weight gain of 30 pounds. lung was permitted to re-expand gradually film in January, 1946, showed slight shadow

foundation to launch this newer concept of antibiotic therapy

In preliminary reports we have shown that osteomyelitis can be cured by this method [1-3] We will briefly report five of the most difficult cases sent to us, involving different anatomic types of chronically infected bones—long bones, skull, spine, and knee joint

Case Reports

Case 1 —This patient had a chronic osteomyelitis of the right tibia of fifty years duration with two chronic sinuses, now closed after topical germicidal detergent antibiotic therapy of aerosol O T with penicillin, administered every four hours night and day for ten days Infecting organism was Staphylococcus aureus

Case 2 —A twenty-six-year-old western rancher had chronic osteomyelitis of twenty-five years duration involving the distal portion of the left tibia The frequent trauma to this leg associated with herding cattle would often be associated with a fracture of the tibia in its midportion, probably due to the chronic osteomyelitis at the distal portion Osteomyelitis was closed by topically applied detergent germicidal aerosol O T therapy, administered every four hours night and day for ten days Infecting organism was hemolytic Staphylococcus aureus

Case 3 —This patient had bad left-sided facial deformity secondary to chronic osteomyelitis of the frontal bone nasal, maxillary, and ethmoid with numerous (probably five) purulent fistulas closed The detergent zephiran chloride, aqueous solution, 1 1,000, with penicillin was used in this patient because of the proximity to the eyes Administered every four hours night and day for ten days Infecting organism was Staphylococcus aureus

Case 4 —Patient has osteomyelitis of the spine, ileum, sacrum, and sacroiliac joint of fifteen years duration. Aerosol O T was administered with penicillin in August, 1946 The discharge did not entirely disappear When seen again on July, 1947, the patient showed improvement about 95 per cent better than prior to treatment. A second course of therapy with aerosol wash containing 500,000 units penicillin plus 500,000 units of streptomycin was started in August, 1947 * The patient was instructed to instill 1 ml. every three hours night and day for five days through a ureteral catheter The sinus closed promptly after a cessation of therapy and has remained so Infecting organism was Staphylococcus aureus

Case 5 —This patient, a veteran injured by shrapnel going through the upper end of the right tibia and fibula, was under treatment for three years and discharged from the veteran's hospital with war injury still draining, and increased evidence of joint involvement of bones and limitation of motion of joint The lesion is now closed with function of knee joint 90 per cent normal. Aerosol O T with penicillin administered every four hours night and day for ten days Infecting organism was hemolytic Staphylococcus aureus

Our series of cases comprised 35 patients treated with germicidal detergent solvents with penicillin The five cases noted above are typical for 22 patients of the entire series Of the remaining 13 cases in the series, seven are improved and want no further therapy but still have some discharge, and six are unimproved These six cases were among some of the earliest cases treated It is conceivable that a combination of factors—inexperience, inadequate supply of detergent, and insufficient knowledge of such solvents—was responsible for the lack of improvement in these patients

We have very deliberately laid great emphasis on this aspect of our work on osteomyelitis If such solutions in diseased bone can destroy bacterial pathogens, the potential effectiveness of detergent antibiotics in soft tissue becomes apparent

Pulmonary Tuberculosis

Advanced cases of pulmonary tuberculosis that had previously received all forms of therapy without results have responded satisfactorily to the same principle of topical therapy when penicillin and streptomycin are used in a germicidal detergent zephiran chloride, aqueous solution, 1 1,000 The solution is inhaled directly into the lungs as an aerosol or mist It is of prime importance to realize that for this type of topical treatment an expandable lung is necessary, and we believe that all collapse therapy should not be used until this infinitely more conservative method is first tried The irreversible tissue damage that reflects itself in high mortality and morbidity rate for pulmonary tuberculosis might, therefore, be arrested This simple and relatively inexpensive plan can very easily be expanded beyond the limited facilities now available It would probably lead to better clinical results, especially when used in early cases

If pulmonary tuberculosis with its complicating and crippling deformities is to be controlled and cured, we feel that this new, nonmutilating method should be considered the first method of choice The topical use of streptomycin and penicillin in a germicidal detergent solvent and inhaled as an aerosol would seem to be an ideal vehicle

The detergent solution is prepared by dissolving 300,000 units of streptomycin and 100,000 units of penicillin in 4 ml of zephiran chloride,

became toxic with elevation of temperature, and it was necessary to reinsert the tube Five local surgeons have attempted its removal during the last seven years but always with the same results He was treated recently with penicillin detergent aerosol wash, and the tube was replaced by a large mushroom catheter so that instilled detergent antibiotic solution would diffuse through the old abscess cavity and not go through to the bronchus Four milliliters of the following solution were inhaled every eight hours, night and day 1 Gm. streptomycin and 1 Gm. penicillin dissolved in 100 ml. of zephiran chloride, aqueous solution, 1 1,000 These detergents were used alternately so that there was a constant introduction of the detergent antibiotic therapy every four hours The patient was instructed to lie on his good side so that the antibiotic detergent solution would have the aid of gravity He had considerable dyspnea on the seventh day, and inhalation was therefore stopped. The tube was removed on the tenth day with no clinical symptoms The dental sepsis which is usually present in putrid lung abscess or empyema was cleared up before therapy was started At present, roentgenographic studies show that suppurative process in the lung has markedly disappeared with aeration and expansion of the diseased area.

The therapy for the various types of cases described in this paper is a radical departure from the usual surgical intervention The philosophic concept of surgeons must also be radically altered to meet present conditions as provided by antibiotics Research workers have provided us with new tools which we, as surgeons, have been slow in utilizing The medical clinician has readily accepted and made use of these antibiotic tools Surgeons have accepted them only as an adjunct to surgery It is now time for us to scrutinize more closely all possibilities of utilization of antibiotics, not only as an aid to surgery, but, wherever possible, as a substitute for surgery

We wish to express our appreciation for the aid given to us by Dr Donald O Hamblin of the American Cyanamid Company and Dr Stanton M Hardy Dr Benjamin Carey and Dr Rutledge W Howard of the Lederle Laboratory Division.

PRIZE ESSAYS

The Merrit H. Cash Prize and the Lucien Howe Prize will be open for competition at the next Annual Meeting of the Medical Society of the State of New York, May 2, 1949, in Buffalo

The Lucien Howe Prize of $100 will be presented for the best original contribution on some branch of surgery, preferably ophthalmology The author need not be a member of the Medical Society of the State of New York.

The Merrit H. Cash Prize of $100 will be given to the author of the best original essay on some medical or surgical subject Competition is limited to the members of the Medical Society of the State of New York, who at the time of the competition are residents of New York State

The following conditions must be observed

Essays shall be typewritten or printed with the name of the prize for which the essay is submitted, and the only means of identification of the author shall be a motto or other device The essay shall be accompanied by a sealed envelope having on the outside the same motto or device, and containing the name and address of the writer

If the Committee considers that no essay or contribution is worthy of a prize, it will not be awarded.

Any essay that may win a prize automatically becomes the property of the Medical Society of the State of New York "to be published as it may direct."

All essays must be presented not later than February 1, 1949, and sent to the Chairman of the Committee on Prize Essays of the Medical Society of the State of New York, 292 Madison Avenue, New York 17, New York.

Armitage Whitman, M.D , *Chairman*
Committee on Prize Essays

second interspace which was somewhat larger when re-examined in June, 1946 Absolute bed rest was advised In July, the lesion appeared better, and there were no abnormal lung signs or clinical symptoms

The patient was first seen by us in October, 1946, with reactivation of tuberculosis and questionable symptoms of tracheobronchial tuberculosis No pathology was seen on bronchoscopy In January, 1947, inhalation therapy was given with temporary paralysis of right diaphragm by crushing phrenic nerve Patient has been followed for eighteen months, and condition is satisfactory Sputums and gastric analyses are consistently negative

All forms of modern collapse therapy for pulmonary tuberculosis predate the antibiotic era During the last quarter of a century, and especially during the last decade, sufficient evidence has become available to show that, in spite of countless technical and mechanical devices, collapse therapy has lamentably fallen far short of the desired goal Of more recent date, streptomycin in adequate quantities has been made available However, associated with the usual mode of administration of streptomycin, some patients may become worse since they develop resistant strains with the resulting clinical danger

We believe, therefore, that the method of choice for therapy of pulmonary tuberculosis may be the use of aerosolized antibiotic therapy, using a germicidal detergent as the solvent No form of collapse therapy or lobectomy should be attempted until this simple, nonmutilating method has been thoroughly investigated

Tuberculous Sinus

The fundamental studies by Schatz, Bugie, and Waksman in isolating streptomycin and the experimental studies by Feldman and Hinshaw led to the clinical use of this antibiotic in the treatment of pulmonary tuberculosis [5,6] We feel that the results might be improved if the basic concept previously noted is followed We believe, also, that cases of chronic draining tuberculous sinuses are an ideal group for topical therapy with streptomycin without concurrent parenteral therapy This almost hopeless complication of tuberculosis might easily be cured

Case 11 —This patient, known to have pulmonary tuberculosis since 1934, had had all accepted forms of therapy until October, 1946 There has been chronic draining since 1939 of a tuberculous sinus secondary to tuberculous empyema for which a complete thoracoplasty was done in 1939 In October of 1946, the patient was hospitalized and treated with a detergent solvent with streptomycin The sinus promptly closed and remained so for seventeen months until February, 1948, when it reopened. At this time, treatment consisted of installation every four hours, night and day, of 4 ml. of the following solution 1 Gm. of penicillin and 1 Gm of streptomycin dissolved in the detergent zephiran chloride, aqueous solution, 1 1,000 The treatment lasted for ten days The sinus closed and shows no signs of recurring four months after cessation of therapy

This case report of a draining tuberculous fistula in which biopsy and bacteriologic studies confirmed the diagnosis supports our theoretic contention that topical detergent antibiotic therapy is the method of choice We have noted none of the toxic effects—dizziness, deafness, or other commonly described complications

If confronted with a similar case, we would unhesitatingly follow the penicillin-streptomycin detergent therapy Originally, we concentrated on Mycobacterium tuberculosis and used only streptomycin detergent therapy ignoring the significant problem of secondary invaders In our second attempt with the use of the penicillin-streptomycin detergent therapy, we were guided by accumulated clinical and experimental experience This simple method of therapy for tuberculous sinuses is strongly indicated as the one of choice in view of the clinical benefits and the small amount of streptomycin used—2 Gm as opposed to 200 to 250 Gm currently used in other technics Before final conclusions can be drawn, it would be desirable to study a larger series of cases

Lung Abscess

The putrid lung abscess is one of the most acute fulminating forms of pulmonary suppuration The accepted treatment has been immediate surgical drainage to remove the suppurative material from the lung and to allow oxygen to enter the abscess cavity to alter the anoxic environment in which the anaerobes thrive It has been felt that without surgical intervention the outlook is almost always fatal

Case 12 —This patient presented a severe infection of the right lung Roentgen diagnosis of large lung abscess and a clinical diagnosis of putrid lung abscess was made There were no results with all accepted medications including sulfa and penicillin Penicillin detergent aerosol therapy was administered, following the technic as described for pulmonary tuberculosis Therapy lasted ten days, and the patient made an uneventful recovery A two-year follow-up recently found the patient in good health without pulmonary symptoms

Case 13 —According to a local physician, this patient had a putrid empyema seven years ago In an emergency, a large rubber tube was inserted into the lung abscess The tube was removed after the acute phase However, the patient immediately

many others if the blocks for histologic sectioning had been more judiciously chosen. In over 83 per cent of the cases possessing a capsule it was possible to demonstrate capsule invasion, although it is realized that there are varying opinions of what constitutes this feature Rigorous criteria must be satisfied before some pathologists accept the fact that the capsule has been penetrated Stout has pointed out the difficulty of determining the presence or absence of invasion by thyroid tumors because of the frequency of hemorrhages and cicatrices in the thyroid gland and that in the resulting scar tissue the inclusion of deformed and otherwise altered thyroid gland cells and acini is frequent and gives the appearance of invasive growth [5]

Graham called attention to the importance of invasion as an aid in determining ot a thyroid neoplasm is benign or He stated that in his series he had blood vessel invasion in "papillifmomata" Graham stated that plied only to a particular form growth, and he called od vessel invasion er types of papilof malignant or nder discussion, dence of blood of blood vessel bably accounts low degree of ors" which in papillary ere found to le to decide essels gether with formation nto epithethyroid may sses, as t an inodular n of hese disurs ss fic ss he n e n

some papillae the fibrous element is reduced to a delicate membrane acting as a support for vascular endothelium on one hand and epithelial elements on the other This sort of papillation is found in non-neoplastic conditions such as Graves disease and in the papillary infoldings sometimes encountered in nodular goiter

In neoplastic disease, however, the papillae contain relatively large amounts of fibrous tissue Since the presence of large amounts of fibrous tissue is the most obvious difference between neoplastic and non-neoplastic papillation it was thought that further investigation might reveal interesting facts The fibrous core of the papillae seems to determine the general pattern, or variations thereof, in a given tumor Thus, the papillae may be simple or branched, slender or thick. The fibrous core of a papilla is subject to all the ills to which fibrous tissue elsewhere is heir Specific changes such as cellular infiltrations and retrogressive alterations will be discussed later

Because of a deplorable lack of follow-up data, it was impossible to determine the malignancy or innocence of a tumor by its effect on the patient's life As an expedient, admittedly poor and questionable, it was decided to study the lesions in the light of opinions rendered by persons who have had more than ordinary experience in the histologic diagnosis of thyroid neoplasms It was hoped that this method would discover some trend in the thinking of such persons that might be of value to others who are required to make diagnoses on thyroid tumors The 87 tumors were accordingly divided into three groups

A lesion was classed as "malignant" if it had been so designated by at least two members of the committee and the submitting pathologist and had not been considered benign or questionably benign by any of the consultants or other members of the committee There were 60 tumors in this group

A lesion was classed as "doubtful" if it was regarded as benign by any of the consultants or by the committee chairman regardless of the number who thought it malignant There were 25 tumors in this group

Since only two tumors were regarded as "benign" by all observers who studied them, this small number was thought to be of no statistical value Accordingly, various attributes of 60 uncontestedly malignant tumors and of 25 doubtfully malignant tumors were tabulated

An attempt was made (Table 1) to estimate the proportion of papillary to nonpapillary tissue by grouping according to the amount of papillation present

Since 36 per cent of the tumors composed almost entirely of papillae fall in the doubtful

PAPILLARY TUMORS OF THE THYROID GLAND

G H Klinck, Jr , M D , Troy, New York

(From the Department of Pathology, Samaritan Hospital)

MALIGNANT disease of the thyroid gland constitutes a confusing chapter in oncology This statement is attested by the perplexing terminology employed and by the difficulty experienced in forecasting the life history of some of the growths Certain forms of malignant disease of the thyroid gland are not a real problem since the behavior of these tumors follows that of similar tumors arising in other organs Thus, patients with giant cell, spindle cell, squamous cell, or small cell tumors and anaplastic adenocarcinomas usually die within relatively short periods of time

There is much confusion regarding the benign or malignant nature of the papillary tumors Willis writes, "Papillary adenomas cannot be distinguished from papillary carcinomas," and he continues, "The discovery that an enucleated tumor has a papillary structure, however highly organized and quiescent in appearance, calls for at least partial thyroidectomy of the tumor-bearing part of the organ and a guarded prognosis "[1] Dunhill saw only two tumors which he regarded as "benign papillomas," and one of these recurred [2] Crile feels that it is not possible, on histologic criteria alone, to classify a tumor as to whether it is a nonpapillary carcinoma with a few papillary foci or whether it is a papillary carcinoma with nonpapillary foci [3] He feels that distinguishing between the two is necessary since the clinical course of each type is different, the papillary tumors being relatively benign. Thus it is evident that differences of opinion exist regarding tumors containing papillae

In the hope of discovering further criteria for the appraisal of such neoplasms and of finding out, if possible, what factors influenced experienced observers in designating a tumor as benign or malignant, this preliminary study of an unselected group of thyroid tumors showing papillation has been undertaken Particular attention has been directed to the papillae—their form, cellular content, and retrogressive changes The material consists of 87 thyroid neoplasms containing papillary formations These represent 27 3 per cent of the 318 thyroid neoplasms, malignant or suspected of being malignant, in the hands of the Committee on Thyroid Cancer of the American Goiter Association Of the 87 lesions only two have been accepted by all examiners as benign The remaining 85 tumors have been classed as malignant or doubtfully malignant There is a strong indication that some observers regard the presence of papillae as a bad sign and are reluctant to designate a lesion as innocent if papillation is present

Of the 87 tumors, the submitting pathologists designated 70 as malignant, 11 as doubtfully malignant, and six as benign Not all of the tumors have been studied by each member of the committee and by each of the consultants, but the results to date show that one consultant, in examining 47 tumors, found 14 (30 per cent) benign and one doubtfully malignant, another consultant studied 22 tumors and designated one (4 per cent) as benign, another reviewed 20 lesions and found one (5 per cent) benign, and two members of the Committee studying all 87 tumors regarded seven (8 per cent) as benign It is apparent that the interpretation of the criteria denoting the presence or absence of malignant disease in the thyroid gland varies widely

Of the 87 lesions, 80 were in women and seven in men, indicating a ratio of about 11 to one In women most of the tumors occurred in the fifth decade The smaller number of men having papillary tumors makes any figures concerning age incidence unreliable It is generally agreed that in all forms of thyroid cancer there is an excess of women afflicted, usually in the ratio of approximately four women to one man Our finding of 11 women to one man makes it appear that neoplasms having papillary formations are particularly prone to occur in women This ratio is even greater than the five to one frequency of Graves disease among women and men Although the majority of the tumors containing papillae were regarded as malignant, it is important to note that, of the 87 cases in this series, 74 had but one operation, 8 had two operations, and 5 had three operations These data might indicate that recurrences are not very frequent and bear out Crile's contention that it is possible to remove all of the neoplastic tissue even after relatively widespread cervical lymph node involvement [4]

The opinion that papillary tumors usually arise in pre-existing adenomas is sustained by finding histologic evidence of a capsule in 75 per cent of the cases in this series It is probable that a capsule would have been demonstrated in

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Pathology and Clinical Pathology May 19 1948.

many others if the blocks for histologic sectioning had been more judiciously chosen. In over 83 per cent of the cases possessing a capsule it was possible to demonstrate capsule invasion, although it is realized that there are varying opinions of what constitutes this feature Rigorous criteria must be satisfied before some pathologists accept the fact that the capsule has been penetrated Stout has pointed out the difficulty of determining the presence or absence of invasion by thyroid tumors because of the frequency of hemorrhages and cicatrices in the thyroid gland and that in the resulting scar tissue the inclusion of deformed and otherwise altered thyroid gland cells and acini is frequent and gives the appearance of invasive growth.[5]

Graham called attention to the importance of blood vessel invasion as an aid in determining whether or not a thyroid neoplasm is benign or malignant [6] He stated that in his series he had not observed blood vessel invasion in "papilliferous adenocarcinomata" Graham stated that this comment applied only to a particular form of intracystic papillary growth, and he called attention to the fact that blood vessel invasion occurs regularly in certain other types of papillary growths [7] In the 85 cases of malignant or doubtfully malignant disease under discussion, 12 (14.1 per cent) showed evidence of blood vessel invasion. The incidence of blood vessel invasion in papillary tumors probably accounts for Crile's opinion regarding the low degree of malignancy of "lateral aberrant tumors" which generally, but not always, abound in papillary formations [4] In four cases vessels were found to be invaded, but it was not possible to decide whether they were blood or lymph vessels

The thyroid gland epithelium, together with stroma, exhibits a propensity for the formation of finger-like or polypoid projections into epithelial-lined spaces Papillation in the thyroid may be the result of non-neoplastic processes, as occurs in hyperthyroidism, it may reflect an increased secretory activity occurring in a nodular goiter, or it may follow the administration of thiourea derivatives The responses of these stimuli follow a more or less uniform and distinctive pattern. Neoplastic papillation occurs as a result of some other unrecognized process This change is not characterized by a specific histologic pattern but by an almost endless variety of patterns Papillary projections in the thyroid consist of a fibrovascular core with an epithelial covering As a rule, the epithelial investment is only one cell layer deep, but in some instances the cells may be piled upon one another The fibrovascular core contains varying proportions of fibrous tissue and blood vessels In some papillae the fibrous element is reduced to a delicate membrane acting as a support for vascular endothelium on one hand and epithelial elements on the other This sort of papillation is found in non-neoplastic conditions such as Graves disease and in the papillary infoldings sometimes encountered in nodular goiter

In neoplastic disease, however, the papillae contain relatively large amounts of fibrous tissue Since the presence of large amounts of fibrous tissue is the most obvious difference between neoplastic and non-neoplastic papillation it was thought that further investigation might reveal interesting facts The fibrous core of the papillae seems to determine the general pattern, or variations thereof, in a given tumor Thus, the papillae may be simple or branched, slender or thick The fibrous core of a papilla is subject to all the ills to which fibrous tissue elsewhere is heir Specific changes such as cellular infiltrations and retrogressive alterations will be discussed later

Because of a deplorable lack of follow-up data, it was impossible to determine the malignancy or innocence of a tumor by its effect on the patient's life As an expedient, admittedly poor and questionable, it was decided to study the lesions in the light of opinions rendered by persons who have had more than ordinary experience in the histologic diagnosis of thyroid neoplasms It was hoped that this method would discover some trend in the thinking of such persons that might be of value to others who are required to make diagnoses on thyroid tumors The 87 tumors were accordingly divided into three groups

A lesion was classed as "malignant" if it had been so designated by at least two members of the committee and the submitting pathologist and had not been considered benign or questionably benign by any of the consultants or other members of the committee There were 60 tumors in this group

A lesion was classed as "doubtful" if it was regarded as benign by any of the consultants or by the committee chairman regardless of the number who thought it malignant There were 25 tumors in this group

Since only two tumors were regarded as "benign" by all observers who studied them, this small number was thought to be of no statistical value Accordingly, various attributes of 60 uncontestedly malignant tumors and of 25 doubtfully malignant tumors were tabulated

An attempt was made (Table 1) to estimate the proportion of papillary to nonpapillary tissue by grouping according to the amount of papillation present

Since 36 per cent of the tumors composed almost entirely of papillae fall in the doubtful

TABLE 1 —PAPILLATION IN TUMORS

Approximate % of Papillae	All 85 Tumors	60 Malignant Tumors	25 Doubtful Tumors
± 5	18 (21%)	15 (25%)	3 (12%)
±25	13 (15%)	10 (17%)	3 (12%)
±50	15 (17%)	12 (20%)	3 (12%)
±75	11 (13%)	9 (15%)	2 (8%)
Up to 100	20 (24%)	11 (18%)	9 (36%)

group, it is possible that the presence of almost complete papillation might be regarded as a token of innocency It must be emphasized, however, that certain students regard the presence of papillae, in large or small numbers, as an omen of evil

It was noted that some tumors had papillae consisting of a fibrovascular core alone, while others contained neoplastic acini as well It was further noted that in some instances acini, containing colloid and resembling those found in adjacent nontumorous thyroid tissue, were present (Table 2)

TABLE 2 —ACINAR CONTENT OF PAPILLAE

	All 85 Tumors	60 Malignant Tumors	25 Doubtful Tumors
Papillae with neoplastic and normal acini	41 (48%)	26 (43%)	15 (60%)
Papillae with normal acini	12 (14%)	7 (12%)	5 (20%)
Papillae with neoplastic acini	29 (34%)	19 (32%)	10 (40%)
Papillae without acini	44 (52%)	34 (57%)	10 (40%)

These findings suggest that normal acini are not often, but can be, present in the papillae of malignant lesions and, further, that neoplastic acini are found quite often in cases of doubtful malignant disease

Very little attention has been paid to the presence of lymphocytes and plasma cells in the papillae of thyroid gland neoplasms The following study was made in order to find out whether the presence or absence of these cells is of significance (Table 3)

TABLE 3 —LYMPHOCYTES AND PLASMA CELLS IN PAPILLAE

	All 85 Tumors	60 Malignant Tumors	25 Doubtful Tumors	Average Age of All Cases
Lymphocytes and plasma cells	29 (34%)	23 (38%)	6 (24%)	40
Lymphocytes	10 (12%)	7 (12%)	3 (12%)	49
Plasma cells	11 (13%)	11 (18%)	0	50
No lymphocytes or plasma cells	56 (64%)	37 (62%)	19 (76%)	59

No significant differences in the presence or absence of lymphocytes and/or plasma cells in the malignant or doubtfully malignant tumors were found The distribution of lymphocytes was found to be greater in the younger age groups This finding is in accord with the relative prevalence of lymphocytes in other tissues in young individuals

Retrogressive tissue changes in the stroma of papillae were found to be distributed as shown in Table 4

TABLE 4 —RETROGRESSIVE CHANGES IN THE STROMA OF PAPILLAE

	All 85 Tumors	60 Malignant Tumors	25 Doubtful Tumors
Psammomatous bodies			
in papillae	9 (11%)	7 (12%)	2 (8%)
in spaces	9 (11%)	7 (12%)	2 (8%)
Hemosiderin			
in papillae	3	1	2
in spaces	16 (19%)	12 (20%)	4 (16%)
Foam cells			
in papillae	11 (13%)	9 (15%)	2 (8%)
in spaces	19 (22%)	17 (28%)	2 (8%)
Hyalinization of papillae	29 (34%)	18 (30%)	11 (44%)
Edema of papillae	13 (15%)	7 (12%)	6 (24%)

Except for a relatively larger number of tumors with edematous papillae in the doubtfully malignant group and a relatively larger number of tumors with "foam cells" in the malignant group no significant relationships were found

The presence of hyperthyroidism and the number of cases having multiple operations are shown in Table 5

TABLE 5 —MISCELLANEOUS DATA

	All 85 Tumors	60 Malignant Tumors	25 Doubtful Tumors
Hyperthyroidism	22 (24%)	19 (32%)	3 (12%)
Number of operations			
2	12 (14%)	6 (10%)	6 (24%)
3	7 (8%)	4 (7%)	3 (12%)

The high proportion of cases in which hyperthyroidism was said to have been present makes it necessary to question the evidence on which these opinions were based Because of the small number of cases having more than one operation, it is not wise to draw generalizations In this series, however, the patients with unquestioned malignant tumors had only half as many multiple operations as those with questionably malignant tumors Inferences as to the significance of this cannot be made until more follow-up data are at hand

The available data indicated that seven of the 87 lesions might be classified as so-called "lateral aberrant tumors" No information which might help clarify the conflicting theories regarding such lesions was discovered

Squamous metaplasia was considered to be present in five cases The malignant group contained three of these, and the doubtful group contained two The degree of squamous metaplasia was slight in all cases, and further studies would be required to prove that such metaplasia was present beyond doubt in every instance

Conclusions

The following information was elicited from this study

Tumors composed almost entirely of papillae occurred twice as frequently in the doubtful group as in the malignant group

Tumors having small proportions of papillae were more frequent in the malignant group

Tumors with only "normal acini" in the papillae occurred relatively more often in the doubtful group

No significant differences in the presence or absence of lymphocytes and/or plasma cells were found in the malignant and doubtful groups It was noted, however, that tumors containing either or both of these cells were found more often in the younger individuals

"Foam cells" were found more frequently in the tumors classified as malignant

Papillary tumors were found 11 times more frequently in women than in men

---

NOTE The author values highly the helpful comments made by Dr Allen Graham during the preparation of this paper

Dr Klinck is now at the Army Institute of Pathology Washington 25 D C

PICKPOCKET MEDICINE

"Pickpocket Medicine" was the title of an address which John L. Bach, director of press relations of the A.M A., delivered recently

His talk stressed the dangers of any form of compulsory insurance for the American people as advocated in the recent report by Federal Security Administrator Ewing. Pointing out that any such plan would necessitate a new payroll tax and the addition to the public payroll of at least 300,000 administrative people to handle the paper work, Mr Bach said "Mr Ewing's plan, costly as it is, is no cure-all for the health care ills of the nation, it is merely a highly tooted snake medicine that falls in the realm of quackery "—*Secretary's Letter, A.M A , November 15, 1948*

WOMEN DOCTORS FOR NAVY

On October 18 the Navy announced a plan for giving commissions to women doctors who have completed internships in civilian hospitals In addition, it hopes to take 25 women doctors into Navy hospitals as interns

NEW INSULIN MIXTURE MORE EFFECTIVE

A new insulin combination which gives the diabetic patient a smoother balance and gentler action and, in addition, allows him more freedom from the hypodermic needle and greater social latitude, has just been announced.

A two-to-one preparation of standard insulin, and protamine insulin, now known only as "2 1 mixture," the product has been used over a period of six years on more than 500 severe diabetics by Dr Arthur R. Colwell, associate professor of medicine at Northwestern University, and president of the Chicago Diabetes Association Ninety per cent of his patients using the new combination need only one injection a day, usually administered in the morning, while the most severe cases require two divided doses a day Like other insulin products, 2 1 may be injected subcutaneously by the patient himself

Not only is a 2 1 mixture more effective in its results on diabetes, but it eliminates hundreds of injections a year per patient, Dr Colwell said "Under the older system, thousands of diabetics, in the course of 20 years, were obliged to run a needle through the skin 20,000 times," he explained.

CONFERENCES ON THERAPY

DEPARTMENTS OF PHARMACOLOGY AND MEDICINE, CORNELL UNIVERSITY MEDICAL COLLEGE AND NEW YORK HOSPITAL

THESE are stenographic reports of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors A selected group of these conferences is published in an annual volume, *Cornell Conferences on Therapy*, by the Macmillan Company

Treatment of Cardiovascular Syphilis

DR BRUCE WEBSTER The subject of the conference today is the treatment of cardiovascular syphilis

As most of you know, if early syphilis is not treated, approximately 10 per cent of those infected develop cardiovascular lesions The best method of dealing with the problem of cardiovascular syphilis, therefore, is to prevent it by the adequate treatment of early syphilis We may now be on the threshold of a new era in the control of syphilis because of the liberal use of penicillin, not only as a specific measure in cases in which the diagnosis of syphilis is established but also as an antibiotic measure in other diseases with which unrecognized syphilis may coexist

There has been a revival of interest in the subject of cardiovascular syphilis in recent years Not so long ago, the chief interest in these patients centered on the diagnosis The attitude of many clinicians was fatalistic, and very little was done, particularly in the way of antisyphilitic therapy The treatment of cardiovascular syphilis falls into two phases one is the general management of the cardiac state, and the other is the specific therapy directed against the underlying infection.

Dr Reader will open the discussion.

DR GEORGE READER Dr Webster has already indicated the importance of cardiovascular syphilis and the number of cases which might occur if syphilis is untreated In addition to being one of the important forms of heart disease, cardiovascular syphilis is one of the most important forms of syphilis, patients with syphilis die from either the neural or cardiovascular form and very rarely from any other

Cardiovascular syphilis results from the invasion of the heart and great vessels by the Treponema pallidum Its basic lesion is an arteritis of the vasa vasorum, by simple extension or by interference with nutrition, this lesion produces a break in the elastic tissue of the media of the aorta, dilatation of the aorta, and contracture of the aortic cusps The process may cause partial or total occlusion of the coronary arteries by extending to involve their ostia Rarely, the myocardium may be damaged by direct invasion by the treponemas and, still more rarely, gumma formation may occur in the heart or great vessels

The various lesions of cardiovascular syphilis may be classified as follows uncomplicated aortitis, saccular aneurysm, aortic insufficiency, coronary artery atresia, syphilitic myocarditis, and gumma formation Uncomplicated aortitis produces an irregular fusiform dilatation of the aorta, but it is generally agreed by students of the subject that this should not be called aneurysm When I use the term aneurysm today, I will be referring only to saccular aneurysms The differentiation of these various forms of cardiovascular syphilis is a matter of some importance, but by long odds the most significant point is to determine whether the patient has syphilis A history is of great help More crucial information is secured from a serologic test for syphilis In patients with cardiovascular syphilis who have never been treated, this test is positive in the vast majority of cases Negative tests in such cases were present in less than 2 per cent in the general experience and in even fewer number in our experience here at New York Hospital The 5 to 10 per cent incidence of negative serologic tests in untreated cardiovascular syphilis is based on the relatively insensitive Wassermann which was done prior to 1938 Two factors will influence the interpretation of a negative serologic test for syphilis in a patient with signs suggesting cardiovascular syphilis A history of treatment with bismuth, arsenic, or penicillin, even in small amounts, is often definitive in establishing the diagnosis of syphilis The same is true of the presence of a lesion characteristic of syphilis, such as the Argyll-Robertson pupil

Physical signs and the x-ray are the chief means for the recognition of the lesions of cardiovascular syphilis. Angiocardiography is extremely helpful The latter is the only means for the detection, with any degree of certainty, of uncomplicated syphilitic aortitis Unless the aortic dilatation is extreme, it can rarely be detected by physical signs The angiocardiogram reveals the irregular dilatation of the ascending aorta, a lesion which is almost exclusively confined to syphilitic aortitis Arteriosclerosis may produce some aortic dilatation, but Dr Charles Dotter, in his angiocardiographic studies at the New York Hospital, rarely encountered a widely dilated aorta from this cause Calcification of the ascending aorta is strong presumptive evidence of syphilis, since in arteriosclerosis this change predominates in the descending portion Hypertension, which may also produce dilatation of the aorta, is distinguished from syphilis by the fact that in hypertension the dilatation is regular and fusiform in contrast to the irregular, saccular dilatation of syphilitic aortitis The angiocardiogram provides the only means for the diagnosis of some cases of aortic aneurysm

An aortic diastolic murmur in the absence of rheumatic heart disease is presumptive evidence of cardiovascular syphilis Hypertension and arteriosclerosis may cause an aortic diastolic murmur, but most experiences are in accord with the belief that aortic insufficiency as the result of either hypertension or arteriosclerosis is rare

Atresia of the ostia of the coronary arteries as the result of syphilis is always a presumptive diagnosis It is to be suspected when angina occurs in a patient with syphilitic aortitis and aortic insufficiency I wish to lay emphasis on the point that the angina representing coronary atresia is likely to be due to syphilis only when aortic insufficiency is also present This has been our experience in the syphilis clinic of the New York Hospital

Syphilitic myocarditis and gumma of the heart are extremely rare, and their diagnosis always remains little more than a suspicion in unusual cases

The chemotherapy of cardiovascular syphilis is a matter of controversy There are two primary questions

Does the treatment accomplish any conspicuous beneficial results? Are there important dangers?

Let me state our position at the outset We believe it is beneficial and that the dangers are not significant Our practice is to treat them intensively The plan we pursued previously consisted of 100 intravenous injections of 0 03 to 0 06 Gm of Mapharsen and 100 intramuscular injections of 0 2 Gm. of bismuth subsalicylate Now that the more potent antispirochetal penicillin is available, we use this In our present experimental schedule of therapy, we give 20,000 units of an aqueous solution of penicillin intramuscularly every three hours, or a single injection of 300,000 units (preferably procaine penicillin), every day for fourteen days, and follow either of these schedules with a course of 300,000 units of aqueous or procaine penicillin twice a week for ten weeks

The decision to employ large amounts of potent antisyphilitic agents was based on the assumption that a low-grade infection such as is found in cardiovascular syphilis would require large doses of the drugs The choice of the schedule in the case of penicillin was based on the experimental evidence in bacterial diseases, confirmed by Dr Harry Eagle for experimental syphilis, that a continuous level of penicillin was not necessary to achieve therapeutic results

The nature of the pathology of cardiovascular syphilis helps to understand what may be expected from specific chemotherapy The spirochete invades the aorta early in the course of generalized infection, but it takes an average of ten years to produce sufficient damage to make the diagnosis clinically evident It accomplishes the end result by damaging the vasa vasorum and interfering with the nutrition of the media Elastic tissue in the media breaks and produces stress on the intima The aortic wall is weakened, it dilates and eventually sacculates The aortic valve cusps contract as the media around them scars, and the coronary ostia are compromised by the same process This theory, the nutritional-mechanical, is the one which most pathologists accept It does not rule out the presence of spirochetes in the intima In a fulminating case of aortitis the spirochetes may well be present throughout the whole wall, but the major damage is produced indirectly by an arteritis of the vasa vasorum

Hu, Lin, Chen, and Frazier have settled the question of whether or not virulent treponemas are present in the aorta in cardiovascular syphilis They ground up the aorta of a patient who had died from syphilitic aortitis and injected it into rabbits Most of their rabbits developed syphilis which is proof that virulent organisms were present in the vessel wall Specific therapy directed against the treponemas would be expected, then, to produce healing of the lesions in the vasa vasorum and indirectly influence the whole pathologic process Treatment cannot restore the continuity of the elastica, and dilatation and contracture may continue for some time before proliferation of fibrous tissue renders the process static Our studies here have confirmed this Moore, Dang-

lade, and Riesinger showed in 1932 that life expectancy after the onset of symptoms from aneurysm is increased by specific therapy to an average of seventy-five months from an average of nineteen months in untreated cases Our data show that patients may live for as long as fourteen years after the original diagnosis of aortic insufficiency Our experience here at the New York Hospital, therefore, shows a much more favorable prognosis in aortic insufficiency than is the common view There is little reason for doubting that these results are, at least in part, due to our intensive use of chemotherapy in these cases

Last year Dr Webster and I followed up the work of Dr Howe at this hospital, by examining microscopically the aortas of all patients who came to autopsy here We compared 19 untreated cases with 19 cases that had received at least 20 injections of arsenic and 20 injections of bismuth Among the 19 treated cases, only three showed an active inflammatory process, on the other hand, all of the 19 untreated cases showed active cellular infiltration of the aorta This suggested healing of the lesion by specific therapy There was also the suggestion that bismuth alone had little effect on the aortitis compared with arsenic, but the number was too small for a final decision to be reached

Much has been written concerning the dangers of chemotherapy in cardiovascular syphilis That accidents have occurred is beyond doubt Such patients have been known to die of ventricular fibrillation from an ordinary dose of arsphenamine The other forms of trivalent arsenic are safer, but even with these a nitritoid reaction or a severe bout of vomiting may prove disastrous in a patient with serious impairment of cardiac function However, the dangers of chemotherapy in cardiovascular syphilis have received more weight than they deserved

The Jarisch-Herxheimer reaction is a danger that is prominently featured It seems to us the least important of all the untoward responses In a search of the literature, I failed to find a single case of death immediately after the onset of treatment, which was proved at autopsy to be due to swelling around the coronary ostia Most reports of a supposed cardiovascular Herxheimer reaction fail to carry conviction You may recall the cases reported in the *J.A.M.A.* a few years ago For the most part, there were accounts of patients with cardiac pain before, during, and after treatment with arsenic and bismuth or penicillin but without satisfactory evidence that the pain was related to the treatment Most syphilologists now begin treatment with full doses of arsenic or penicillin and ignore the hazard of a Jarisch-Herxheimer reaction which is essentially theoretic It is certain that one cannot avoid a Herxheimer reaction by beginning treatment with small doses, since it has been shown in the case of secondary syphilis that as soon as the dose becomes sufficient to prove therapeutically effective, the Herxheimer reaction may take place

The therapeutic paradox seems to be another bogey Attention was originally called to this phenomenon by the experience that patients with syphilitic heart disease sometimes went into failure during and after specific therapy If one examines some of the early reports, one finds that some of these patients had heart failure before treatment, that the failure was brought under control, and that they subsequently developed failure again. There is no clear proof in these that the specific therapy was anything more than incidental in the course of these events, for bouts of failure with temporary periods of recovery are known to occur in other forms of heart disease The notion of the therapeutic paradox has also been applied to the case of aortic insufficiency and to angina in consequence of narrowing of the coronary ostia There is the possibility that, after specific therapy eliminates the active process, the ensuing scar formation may lead to aortic insufficiency as the result of contracture of the aortic cusps Such scarring at the coronary ostia may also diminish coronary flow It is quite probable that such changes occur The experience in our clinic, with aortic insufficiency occurring in this way, indicates that it is a benign process with self-limiting progression It is our belief that disability from either aortic insufficiency or coronary atresia arising in this manner is essentially theoretic and that the so-called therapeutic paradox should not be used as a basis for withholding specific therapy in cardiovascular syphilis

There is a legend with regard to the nonspecific therapy of cardiovascular syphilis that treatment with digitalis and other drugs usually called upon in cardiac failure is of little benefit in a patient with syphilitic aortic insufficiency This is quite without basis in fact We have proved time and again in the New York Hospital that patients with cardiovascular syphilis, who have gone into failure, respond to digitalis and mercurial diuretics in the same manner as patients with any other type of heart disease

DR WEBSTER This discussion by Dr Reader has brought up a number of points which are controversial and which will warrant further discussion

Dr Gold, do you have any comments?

DR. HARRY GOLD I might ask a question or two on some points which I have jotted down What proportion of patients with syphilis who come to postmortem for some reason unrelated to the syphilis show syphilitic involvement of the aorta?

DR. READER The figures, which are usually quoted relating to this point, concern autopsies of patients who have shown one or another lesion of syphilis In such a group, syphilitic lesions of the aorta occur in about 70 per cent In a group of patients with latent syphilis, that is, no manifest lesions of syphilis, I believe the incidence of aortic lesions at autopsy would be much smaller

DR. WALTER MODELL I should like to have this clarified for me I think the statement was made that it was not your intention to keep a sustained level of penicillin, since it had been demonstrated that such a level was not necessary If that is so, why is it that doses of penicillin are given every three hours in your regimen?

DR. READER The regimen represents a compromise Dr Walsh McDermott and others have expressed the belief that intermittent doses would be satisfactory, and, in fact, such schedules are being used Most clinics in the country are now using a schedule in which the penicillin is administered for about two weeks Such a period of treatment seemed to us to be short for a disease with the type of pathology found in cardiovascular syphilis Therefore, we adopted the plan of an intensive treatment for a period of two weeks and extended the treatment through ten additional weeks during which a less intensive dosage schedule is applied

DR. WEBSTER Our therapy is a compromise because we did not feel satisfied to discontinue the treatment at the end of two weeks on the basis of the histologic evidence Cardiovascular syphilis appeared to be more resistant to arsenical therapy than other forms of syphilis Therefore, we reasoned that it might prove more resistant to penicillin We believed that we had a greater chance for success by prolonging treatment over a period of about ninety days

DR GOLD Is this method which you have just outlined the one you advocate for routine use at the present time?

DR. WEBSTER We are using it

DR. GOLD You do not give any arsenic or bismuth?

DR WEBSTER I would not

DR. GOLD Only penicillin?

DR WEBSTER The Veterans Administration and the Army have adopted the plan of giving penicillin for two weeks as their therapy for cardiovascular syphilis Similarly, in Dr Stokes' clinic in Philadelphia and in Dr Moore's clinic in Baltimore, they are treating cardiovascular syphilis with penicillin given continuously over two to three weeks

DR GOLD Are the patients ambulant?

DR WEBSTER Here we hospitalize them for two weeks and then carry them on an ambulatory basis

DR GOLD Would you have any objection to having the patient receive the injections of the first two weeks while he is up and about and working?

DR WEBSTER No

DR SEYMOUR RINZLER Do you have any statistics on the comparison of the results with penicillin and arsenicals?

DR. WEBSTER That question brings up the matter of how to evaluate results in cardiovascular syphilis The ultimate evaluaton is made in terms of the length of time the patient survives after the diagnosis is made and the nature of the findings at autopsy

DR RINZLER Do you have any comparative statistics?

DR WEBSTER It is still too early for such data

DOCTOR What is the outlook for the patient with syphilitic aortic insufficiency from the time of the first bout of failure?

DR. READER The prognosis varies with the individual patient, and it is impossible to generalize It depends, in part, on the presence of other heart disease and on the general health of the patient We have patients in our clinic who have been treated with digitalis and mercurials for ten to fifteen years and who are still gainfully employed Their work load has had to be reduced They are not heavy laborers, but they are able to support themselves In general, the prognosis in most cases is now much better than the one- to two-year figures which are often quoted

DOCTOR Dr Reader, I would like to hear some more discussion on the differential diagnosis of early uncomplicated aortitis, that is, how does one decide between syphilis and arteriosclerosis as the etiologic factor?

DR READER I have little to add to what I have already said about this matter I can only emphasize that angiocardiography is extremely valuable as an aid Calcium deposition in an irregularly dilated ascending aorta in the presence of a positive serologic test for syphilis or a history of antisyphilitic therapy constitute strong support for the diagnosis of syphilitic aortitis In contrast, arteriosclerosis rarely affects the ascending aorta and produces little or no dilatation, hypertension produces a regu-

lar, fusiform dilatation of the ascending aorta but not of the magnitude of that seen in syphilis A mistake can be made when the combination of hypertension and arteriosclerosis produces dilatation of the aorta in a patient with a positive serologic reaction However, the percentage is definitely in your favor if you call every case with calcified and dilated ascending aorta and a positive serologic test one of syphilitic aortitis and treat it as such With the present treatment the risk is negligible There are, to be sure, cases of syphilitic aortitis in which none of the foregoing signs are present, when the disease is in such an early stage that the clinical diagnosis cannot be made

DR WEBSTER We have always acted on the premise that a patient with a positive serologic test and a dilated ascending aorta should be treated as a case of cardiovascular syphilis By the present methods of treatment one would do no harm even if it turned out not to be syphilitic aortitis On the other hand, if the condition is syphilitic, withholding treatment would result in irreparable damage We have preferred to lean over backwards, and we have treated a few patients in whom treatment was perhaps unnecessary It has been pretty well proved at autopsy that the majority of lesions, the etiology of which seem uncertain clinically, turn out to be syphilitic when the final answer is obtained.

DR GOLD I want to ask you about a situation which we encounter not infrequently in the clinics In the typical case, a man, forty-five years of age with a blood pressure of 160/90, when examined fluoroscopically shows quite a bulge in the region of the ascending aorta in the P-A view, and in the oblique view the bulge is unquestionable The aorta gives the appearance of saccular dilatation. The patient has a negative blood Wassermann and a negative history for syphilis The reason I ask this question is that a dilated aorta in hypertensive and arteriosclerotic disease was described as rare earlier in this conference This seems to be one of the most common sources of diagnostic trouble in our clinics, namely, the patient with negative serology, hypertension and arteriosclerosis, and a bulging or widened ascending aorta Would you treat such a patient as a syphilitic?

DR WEBSTER Not with negative serology and without a history of syphilis I think you have to depend a great deal on the history in these cases

DR READER Do you do angiocardiograms on these patients, Dr Gold?

DR GOLD No

DR READER I think Dr Dotter has shown conclusively that it is impossible to ascertain by fluoroscopy alone whether the aorta is dilated. A tortuous aorta can simulate a dilated aorta Without angiocardiography one cannot be certain Dr Dotter has proved in several cases, in which a diagnosis of saccular aneurysm of the ascending aorta had been made in the absence of a history of syphilis, that the aorta was not sacculated but merely tortuous

DR GOLD I am not sure that I could agree that it is difficult to see a real bulge to the right of the sternum and a localized bulge at the beginning of the aorta, when the patient is examined fluoroscopically in the P-A and oblique views

DR READER I think it is quite common to find bulging of the aorta with hypertension because the pulsations are so prominent, but an actual saccular dilatation of the ascending aorta just does not occur without syphilis It is practically unknown. I am willing to stand on that

DR GOLD I agree that the typical sac is seen only in syphilis, but this represents an advanced lesion There is a stage in syphilis of the aorta where all one sees is a slight bulging It is in this stage in which we encounter all the difficulty in differentiating syphilis from arteriosclerosis or hypertension When one sees a large, rounded sphere in the region of the aorta, the differential diagnosis is not difficult by any method of examination, either angiocardiography or simple fluoroscopy In this connection I should mention that fluoroscopy is more satisfactory than the x-ray plate In the former examination advantage can be taken of the most favorable angle of rotation in the oblique positions for disclosing the maximum salient of a bulge

DR WEBSTER I would like to add a word about angiocardiography in the diagnosis of cardiovascular disease It has long been recognized that the diagnosis of uncomplicated aortitis is very difficult This is the most important stage of the disease in which to make the diagnosis because it is the stage in which treatment offers the best prognosis Angiocardiography seems to have answered many of our problems We started it with some trepidation because we were afraid of reactions The only complication has been a mild chemical thrombophlebitis which subsides readily Angiocardiography is the single most important advance which has been made in a long time in the diagnosis of this disease

DR GOLD Would you tell us how you do it?

DR. WEBSTER The technic is very simple Through a 12-gauge needle which has been introduced into an antecubital vein, about 40 or 50 cc of 75 per cent Neo-Iopax or 70 per cent Diodrast are introduced into the circulation It is the

usual procedure to take two left anterior oblique films The first is taken in an average of about ten seconds after the injection of the contrast medium has begun The interval varies with the cardiac status In the presence of failure, the interval is considerably longer The radiologists now have a special x-ray machine It takes a film at intervals of 0 6 second, and as many films as necessary can be taken The films are larger than the routine chest film to make accurate measurements possible

DR. GEORGE PEABODY In relation to Dr Gold's point about the diagnosis of early dilatation, I think the series of patients which we are now studying may be of some interest In these we obtained a simple chest x-ray and an angiocardiogram The angiocardiogram sometimes shows a dilatation which is not seen in the x-ray, and conversely, a contour interpreted as a dilatation in the x-ray fails to appear in the angiocardiogram The angiocardiogram has proved to be the only method of establishing the diagnosis of dilatation with certainty

DR. MCKEEN CATTELL In speaking of the therapeutic paradox, Dr Reader mentioned scarring as one of the complications of therapy Does he have evidence that scarring is less in the same period of time without treatment? Is scarring specifically accelerated by the treatment?

DR. READER I am not sure of that, Dr Cattell Our evidence indicates that scarring is part of the pathologic process, and it is our belief that it develops even after the inciting organism has been eliminated

DR PEABODY In view of what Dr Reader has just stated, what would be the significance of the serologic test? We have had patients with a diagnosis of uncomplicated aortitis who received treatment which we considered to be adequate and in whom the serologic test turned negative after the treatment Some of these, however, went on to develop aortic insufficiency We raised the question as to whether these should be re-treated Additional treatment would not be logical if the progression to aortic insufficiency were simply the result of an anatomic change in consequence of damage previously produced by the active infection Would a positive or negative serologic test after adequate treatment help to decide the issue?

DR WEBSTER That is a very good point

DR READER I believe that these patients provide evidence for the nutritional-mechanical mechanism of damage and indicate that it is not the active invasion of the aortic intima by spirochetes which produces the aortic insufficiency I do not believe that the kind of patient you describe needs to be re-treated, irrespective of whether the serology has become negative or has remained positive The important point in this connection is the fact which you mentioned, namely, that an adequate course of treatment had been given.

DR PEABODY I would also like to ask Dr Reader about another point We have recently seen several patients who were admitted to the hospital for treatment of syphilitic heart disease, because, under clinic supervision, they developed an early diastolic murmur The murmur was heard by several observers over a period of three to four months It was also heard within the first few days following hospitalization Thereafter, a controversy arose, many observers were unable to hear the diastolic murmur and disputed its presence Should that be taken to mean that rest abolished the murmur and that perhaps we are not employing rest sufficiently in the treatment of the patient with syphilitic heart disease?

DR. READER I think your observation is a common experience Of course, there always remains the possibility that the murmur was there and for some reason was not heard by the particular observer, but this has happened often enough to the same competent observers to leave little doubt that the murmur comes and goes Perhaps it can be explained by dilatation of the aortic ring The dilatation would be expected to increase when the heart is put under stress and to diminish when the stress is removed, with the result that the murmur would disappear Rest is a very important feature in the treatment of patients with cardiovascular syphilis These patients in failure need greater care than those in failure from rheumatic heart disease They must be warned to avoid overexertion, and even moderately heavy labor should be interdicted for the rest of their lives

DR GOLD I wonder whether dilatation of the aortic ring is the best explanation for the observation that the diastolic aortic murmur is heard at one time and not at another The aortic insufficiency is caused by distortion of the valves in such a manner as to make it impossible for them to make a tight closure The audibility of a murmur under these conditions is related to the kind of vibrations which are set up, and the latter in turn depend on the speed and pressure of the circulation Changes in these vibrations would be expected to occur with variations in physical exertion In this connection, it is noteworthy that even in the most advanced forms of heart failure from any cause, physical exertion, which produces marked increase in cardiac and vascular pressure with

marked dilatation, rarely, if ever, produces a basal diastolic murmur

DOCTOR How much penicillin is given in the ten-week period of treatment?

DR READER It makes a total of 6,000,000 units This is in addition to the 2,240,000 or 4,200,000 units which are given in the first two weeks, depending on which schedule is selected

DR WEBSTER One may ask whether we are justified in treating cardiovascular syphilis with penicillin at all We know that penicillin is probably the most potent antispirochetal agent in early syphilis We know its value in neurosyphilis and in syphilis during pregnancy It would seem to be a safe conclusion that, if it is so potent against spirochetes in all those conditions, it will prove effective in cardiovascular syphilis For final evaluation, a long-term study is necessary Plans for it are now in the making We shall have the definite answer only when the patients who are now being treated have lived out their lives and data are obtained revealing whether these lives were longer or shorter than their expectancy by other methods of treatment and also when a certain number have come to autopsy Penicillin therapy has few hazards I think we are justified in using it until some evidence appears to the contrary

Summary

DR CLARKE WESCOE The treatment of cardiovascular syphilis is a controversial subject There is no complete agreement even on such fundamental questions of whether specific antisyphilitic therapy exerts any beneficial effects or whether the beneficial effects which may occur are offset by the inherent dangers The position adopted by the workers in the syphilis clinic of the New York Hospital, who have devoted a great deal of attention to the problem of cardiovascular syphilis, was explored in the conference this afternoon Their experience leads them to the belief that intensive antisyphilitic therapy should be applied in all cases of cardiovascular syphilis They recommend penicillin as the therapy of choice and advocate a schedule of 20,000 units intramuscularly every three hours around-the-clock or 300,000 units (preferably procaine penicillin) daily, for the first two weeks, followed by 300,000 units twice a week for the next ten weeks

The defense of this position lies in the proof that spirochetes are active in the aorta of the patient with syphilitic aortitis and in the observation reported in the literature—that the duration of life from a particular point in the disease was about four times as long in cases that were treated as in comparable ones that went without treatment While the dangers of specific treatment in cardiovascular syphilis are recognized, emphasis was placed on the point that disasters are infrequent and that some of the hazards that are stressed in the literature, such as the Jarisch-Herxheimer reaction and the so-called therapeutic paradox, are, for the most part, hypothetic The discussion embraced points relating to differential diagnosis, the pathogenesis of the cardiovascular lesions of syphilis as a basis for understanding what may be expected from specific antisyphilitic drugs, and the use of nonspecific measures in cardiovascular syphilis The experience with angiocardiography leads to the belief that it is one of the most important aids for detecting the type of dilatation of the ascending aorta which is characteristic of syphilitic aortitis The view was expressed that arteriosclerosis and hypertension produce changes in the aorta that are difficult to distinguish grossly from those of uncomplicated syphilitic aortitis, but the point was made that the dilated ascending aorta, in the presence of positive serology, had best be considered as syphilitic aortitis and treated as such, since a large proportion of these prove to be syphilis, and the few in which that does not turn out to be the case are not injured by the relatively innocuous specific therapy which is now available

Another point of interest is the observation that angina pectoris in the patient with syphilis is likely to be an independent disease, unless it is encountered in association with aortic insufficiency In the detection of syphilitic cardiovascular disease, it is of first importance to ascertain whether the patient has syphilis, and in this connection it was pointed out that the high incidence of negative blood serology in cardiovascular syphilis no longer applies to the present-day problems The use of more sensitive tests show that the vast majority, 98 per cent or more, of cases of cardiovascular syphilis have positive blood serology The experience at the New York Hospital, based on the intensive use of specific antisyphilitic measures, formerly arsenicals and bismuth and now penicillin, as well as the liberal application of nonspecific measures, such as rest, digitalis, and the mercurial diuretics, indicates that there is much in cardiovascular syphilis which is accessible to control, and that the gloomy outlook of the past may no longer apply to this group of patients There is much promise in the routine use of penicillin for the control of cardiovascular syphilis, both in prevention and treatment The final proof awaits the evidence of the long-term investigations which are now in progress

NECROLOGY

Philip H. Bourne, M D , died on January 2 at the age of seventy-nine A physician in Salamanca for fifty-five years, Dr Bourne was graduated from the University of Michigan Medical School in 1891 He was a coroner for Cattaraugus County at the time of his death and was a member of the American Medical Association and the New York State and Cattaraugus County Medical Societies

William Ballantine Boyd, Sr , M.D , seventy-one, of New York City, died on December 1 Dr Boyd, a graduate of the College of Physicians and Surgeons, Columbia University, in 1905, was an alumnus of Sloane and Presbyterian Hospitals He had served as an assistant attending physician at Vanderbilt Clinic and for several years was in charge of the Personnel Medical Clinic

Fred J Douglas, M D , who represented the Thirty-third Congressional District for four terms, died at his home in Utica on January 1 after a long illness He was seventy-nine years old Active in the Utica political scene, Dr Douglas received his medical degree from Dartmouth Medical School in 1894 He joined the staff of Faxton Hospital in 1899 and from 1921 until 1932 was surgeon-in-chief He also served as a consultant surgeon at St Elizabeth and Utica State Hospitals, Utica Dr Douglas was a fellow of the American College of Surgeons and a member of the American Medical Association, the Utica Academy of Medicine, and the New York State and Oneida County Medical Societies

Thomas Irwin Henning, M D , died on January 8. His age was eighty-five. Dr Henning, who was made a Licentiate of the Royal College of Physicians, England, in 1890, had practiced medicine in Glens Falls from 1891 until his retirement twenty years ago He had also been a consultant on the staff of Glens Falls Hospital.

Alexander Codling Howe, M.D , eighty-six-year-old retired ear, nose, and throat specialist, died at his home in Brooklyn on December 23 Dr Howe was graduated from New York University College of Medicine, in 1893 He had been a surgeon at the Brooklyn Eye and Ear and Jewish Hospitals, a member of the board of Peck Memorial Hospital, and an attending surgeon on the staff of Methodist Hospital, Brooklyn He had also served as medical director of the Brooklyn Y M C A. Dr Howe was a fellow of the American College of Surgeons and a diplomate of the American Board of Otolaryngology and was a member of the American Medical Association and the New York State and Kings County Medical Societies

Myron Brill Morris, M.D , died of a heart attack on January 4 at the age of sixty-eight A physician and surgeon on Staten Island for forty-five years, Dr Morris was a graduate of Syracuse University Medical School in 1904 After his internship at St Joseph's Hospital, Paterson, New Jersey he joined the staff of St Vincent's Hospital, West New Brighton, Staten Island, in 1910 and served on the staff of that hospital until his retirement five years ago He continued to serve as consulting surgeon for the hospital even after his retirement He was chief surgeon for seven years and chief of the hospital staff for fifteen years Dr Morris had also been medical examiner for the New York State Athletic Commission for several years and during both world wars was chief physician at the Bethlehem Steel shipyards on Staten Island

Samuel H Nerenstone, M.D , of the Bronx, died on October 25 He was fifty-one years old Dr Nerenstone was graduated from Cornell University Medical College in 1923 He was chief of the proctologic service and a clinical assistant in surgery of the Lincoln Hospital Outpatient Department, Bronx Dr Nerenstone was a member of the New York Proctological Society, the American Medical Association, and the New York State and Bronx County Medical Societies

John Joseph O'Loughlin, M.D , fifty-five, died of a cerebral hemorrhage on December 14 Dr O'Loughlin received his medical degree from Fordham Medical School in 1918 He was a first lieutenant in the Army Medical Corps during World War I In addition to his practice in Howard Beach, Queens, Dr O'Loughlin served as an associate surgeon on the staff of Bushwick Hospital, Brooklyn He was a member of the American Medical Association and the New York State and Queens County Medical Societies

Michael Francis O'Shea, M.D , seventy-seven-year-old retired physician of West New Brighton, Staten Island, died on January 1 Dr O'Shea was graduated from Bellevue Hospital Medical College in 1897

Joseph Sweetman Parent, M D , died on December 7 Dr Parent, aged eighty-seven, had practiced medicine in the town and village of Galway for fifty-six years when he retired in 1942 He had also served as health officer for the town for several years He received his medical degree from Albany Medical College in 1886 He was a member of the Albany Medical College Alumni, the New York State and Saratoga County Medical Societies, and the American Medical Association

Leo S Schwartz, M D , of Brooklyn, died on December 31 at the age of sixty-six. Dr Schwartz, a graduate of Cornell University Medical College in 1908 and an alumnus of Jewish Hospital, Brooklyn, was formerly chief gynecologist and director of obstetrics at Jewish Hospital He was a clinical professor in obstetrics and gynecology at the Long Island College of Medicine and had also been chief of gynecology and director of obstetrics at Israel Zion Hospital, now a division of Maimonides Hospital.

Dr Schwartz was a director of the American Jewish Physicians' Committee, a fellow of the American College of Surgeons, and a diplomate of the American Board of Obstetrics and Gynecology He served as president of the Brooklyn Gynecological Society in 1932 and of the Kings County Medical Society in 1944 and was, in addition, a member of the American Medical Association and the New York State Medical Society

Mose Scuccimara, M D , a physician in Peekskill for twenty-nine years, died on December 26 at the age of sixty-five Graduated from Fordham Medical School in 1919 Dr Scuccimarra served as plant physician at Standard Coated Products from 1927 until his retirement last year, and was on the staff of Peekskill Hospital During the recent war he was examining physician for the Selective Service Board He was a member of

HOSPITAL NEWS

Hospitals Warned on Narcotics

DR HERMAN E HILLEBOE, State Health Commissioner, has called upon hospitals, pharmacists, and physicians to take greater care in guarding narcotic drug supplies There were more than twenty major thefts of such supplies from New York State hospitals during 1948 in New York City, Buffalo, Troy, Syracuse, Rochester, Schenectady, and Jamestown

Dr Hilleboe outlined a program to help meet the situation, calling for prompt installation of suitable storage space, adequate protection for all doors and windows leading to hospital pharmacies and drug stock rooms, and use at all times of all protective devices, keeping working stocks of narcotic drugs at a minimum, returning working drug stocks to protective storage when the drugs are not in active use, and guarding against overstocking at main supply points

"Too many hospitals regard drugs only in the light of their legal value a mistake shared by pharmacists and physicians," Dr Hilleboe said "They fail to realize that the underworld prices on morphine and cocaine are reportedly more than 100 times their legal value, that one ounce of cocaine for instance, for which they might pay $15, produces a phenomenally exaggerated price in illicit traffic of the drug"

State's Pay to Hospitals Rises

GOVERNOR Thomas E Dewey announced that beginning January 1 an increase in the maximum daily rate paid to hospitals for rehabilitation services for physically handicapped children has gone into effect The former rate of $6 25 a day to general hospitals is increased to $8 50, while the increase for convalescent hospitals is from $5 00 to $6 00 a day The State and localities each pay half

The total number of physically handicapped children who were hospitalized during 1947 was 5,600, and included spastics, paralytics, and amputees Health authorities expect the number to be increased to 6,500 for 1949

The present maximum daily rate has been in effect since July 1, 1947 The higher rates became necessary because of increased costs

Bernecker Appointed Administrator for N Y U -Bellevue Center

DR EDWARD M BERNECKER, who has resigned as New York City Commissioner of Hospitals, has been appointed administrator of hospital services at the New York University-Bellevue Medical Center, according to an announcement from Dr Harry Woodburn Chase, chancellor of N Y U

In his new position, Dr Bernecker will be responsible for the administration of University Hospital formerly the New York Post-Graduate Hospital which was transferred to the N Y U -Bellevue Center on December 1, 1948 He will also be responsible for the coordination of clinical programs for instruction at other hospitals associated with the Medical Center, and the administration of the University's Institute of Rehabilitation and clinics

Mr Edwin A. Salmon, director of the Medical Center, said that Dr Bernecker's knowledge of hospital construction would be of great assistance in executing the construction program scheduled to begin this spring in the four blocks north of Bellevue Hospital, between First Avenue and the Franklin D Roosevelt Drive

Postgraduate Program for Mather Memorial Hospital

ARRANGED by the Council Committee on Public Health and Education of the Medical Society of the State of New York, with the cooperation of the State Department of Health a program of postgraduate instruction will be held for the medical board of the Mather Memorial Hospital, Port Jefferson, on Thursday, February 24, at 11 30 A M

Dr Charles A R. Connor, instructor in medicine at the New York University College of Medicine, will speak on "Rheumatic Fever"

NEWS NOTES

The medical board of the White Plains Hospital, White Plains, for 1949 was appointed at the December meeting of the Board of Governors, with Dr Edwin G Ramsdell continuing as chief of staff Medical board members are Dr Ramsdell, director of surgery, Dr Edward W Weber, director of medicine, Dr J R. Montgomery, director of obstetrics, Dr J R. Whisenant, director of urology, and Dr R. W Moriarty, director of eye, ear, nose, and throat Appointed doctors at large were Dr D A MacDonald, Dr J W Ehrlich, Dr W M Sheridan, and Dr John Cannon.

Dr Spencer Myers was elected president of the medical staff of the Ossining Hospital, Ossining at the annual organization meeting December 29 Others elected were Dr M S Rudnick, vice-

president, and Dr Harold W Kipp, secretary-treasurer

Dr I. Herbert Scheffer, former medical superintendent of the Metropolitan Hospital, New York City, has been promoted to a position as general medical superintendent of the New York City Hospital Department, as of December 16, 1948

Dr Lloyd H Gaston assistant director of St Luke's Hospital, New York City since 1945, has been appointed director of the Hospital, effective January 1, succeeding Dr Claude W Munger, who retired July 1, 1948, because of ill health Since that time, Dr Gaston has been acting director

Dr Walter E Lawrence, former assistant to the superintendent of the Schenectady County Hospital for six years, has succeeded Dr Walter L Rathburn as superintendent of Newton Memorial Hospital in Cassadaga

Fifteen more private rooms will be available for St. Francis Hospital, Olean, with the construction of a $100,000 addition as a wing in the rear, Mother Mary Viator has announced. The rooms on the first floor, are now occupied by the Sisters of St Francis, who will be housed in the addition The bed capacity of the hospital now is 100

The appointment of Dr Leo M Davidoff as director of neurosurgery at Beth Israel Hospital, New York City, has been announced. Dr Davidoff is professor of clinical neurologic surgery at the College of Physicians and Surgeons, Columbia University

With Grover A. Whalen and other speakers citing its record of having cared for nearly one million patients, Beth-El Hospital, Brooklyn celebrated its twenty-fifth anniversary December 19 at the Waldorf-Astoria Hotel, New York City Mr Whalen, as chairman of the city's Golden Jubilee Committee, cited progress in medicine and surgery and outlined the growth of the city during the last half century In spite of the storm, 970 persons attended the Silver Jubilee Dinner

The Central Harlem Medical Society, New York City, composed of 180 Negro physicians, has voted indorsement of the interracial policy at Sydenham Hospital, New York City, and of the campaign to make up operating deficits, Dr Cyril H. Dolly, president of the society, announced.

At the regular meeting of the staff of Highland Hospital, Beacon, Dr C B Dugan was re-elected president of the medical staff

Dr Frank R Henne, formerly with the Marcy State Hospital, has been appointed assistant director of the Harlem Valley State Hospital, Wingdale Dr Louis Loeffler, Ogdensburg, has been appointed director of laboratories

Dr Eugene J Cohen spoke on "The Use of Androgens in Males and Females" and "A Review of Some of the Recent Advances in Thyroid Physiology and Therapy" on January 3 and January 10, respectively, at the Veterans Administration Hospital, Castle Point

Officers for 1949 were elected at the regular meeting of the medical staff of the E J Meyer Memorial Hospital, Buffalo They are Dr Donald R. McKay president, Dr George E Slotkin, vice-president, Dr Kenneth Goldstein, secretary, and Dr Ernest L Brodie, treasurer

Dr George W Wheeler, assistant director of the New York Hospital, has retired after thirty-six years of service He was guest of honor at a testimonial dinner given by the Board of Governors of the Hospital, and was elected an honorary life member of the Society of the New York Hospital.

NECROLOGY

the New York State and Westchester County Medical Societies and the American Medical Association.

Andrew John Taddeo, M D , died at his Bronx home on December 24 after a brief illness He was forty-eight years old. Dr Taddeo, a captain in the Army Medical Corps in World War II received his medical degree from New York University and Bellevue Medical College in 1929 and interned at St Mary's Hospital, Hoboken, New Jersey He was assistant attending physician a Morrisania Hospital.

MEDICAL NEWS

Columbia Coordinates Physical Medicine Program

COLUMBIA University, New York City, on January 1 embarked upon a new program of coordination and integration of the widespread physical medicine program which has been developed under impetus from a grant of $400,000 from Bernard Baruch through the Baruch Committee on Physical Medicine

President Dwight D Eisenhower announced that Dr Robert C Darling, associate professor of medicine at the College of Physicians and Surgeons and chairman of the physical fitness subcommittee of the Baruch Committee, will serve as coordinator of the program Dr Willard C Rappleye, dean of the Faculty of Medicine, explained that, as a result of the Baruch grant, the University's physical medicine facilities have become so diverse and numerous that the need has arisen for a coordinator

The new program will deal with the instructional and research activities in physical medicine at Columbia-Presbyterian Medical Center, the Institute for the Crippled and Disabled, which is affiliated with Columbia, the instructional program in physical and occupational therapy at the Medical Center and Teachers College, and training projects for both technical and medical personnel at the Medical Center as well as eight other hospitals in New York City

The physical therapy services at the Medical Center during the year ending December 31, 1947, administered 161,233 treatments, Dr Rappleye announced, and in occupational therapy, 30,719 treatments were given—a total of 191,952 treatments In the teaching phase, the University conducts three courses in physical medicine for physicians, in addition to classes in occupational and physical therapy

Accidents to Workers Increase in 1948

THE number of accidents to workers reported last year by employers in this State reached a high record of 818,694, the New York State Workmen's Compensation Board said recently

Miss Mary Donlon, board chairman, said that the increase of 4 per cent over the number of accidents reported in 1947 was because of high employment, improved reporting methods of employers, and the expansion of workmen's compensation coverage to new groups, such as domestic workers and volunteer firemen The accident rate is "leveling off," Miss Donlon said.

The increase in the number of accidents was sharpest in the New York metropolitan area, including, in addition to the city, the counties of Westchester, Nassau, Suffolk, and Rockland The metropolitan district reported 468,359 accidents last year, an increase of 6 per cent over 1947

The Buffalo and Albany districts showed increases in the number of accidents over 1947, while the Rochester and Syracuse districts reported a decline in accidents

The Binghamton office, opened last March 1, reported 16,295 accidents for ten months of 1948 During the first two months last year, as in previous years, the industrial accidents from counties in that part of the State had been reported to other upstate offices

The accident figures for each of the six district offices of the Workmen's Compensation Board, for 1948 and 1947, follow

District Office	1948	1947
New York City	468,359	441,159
Albany	84,808	81,233
Binghamton	16,295	
Buffalo	113,042	107,512
Rochester	55,200	55,822
Syracuse	80,990	101,519

"While continued emphasis on safety and accident avoidance are reflected in a leveling off of reported accidents relative to the number of workers employed in compensable employments," said Miss Donlon, "the plain truth is that carelessness is still causing too many avoidable accidents Even though many of the 818,694 accidents were minor, there was some medical care given and some discomfort suffered even when little or no work time was lost"

Declaring that analysis of several hundred thousand cases showed that the "human factor" was the cause of more accidents than machine failures or defects, Miss Donlon said "Here is the opportunity for management and labor to cooperate with obvious benefits to all. The only good accident is the one that never happens"

National Cancer Institute Grants Announced

GRANTS totaling $508,527, to aid laboratory and clinical cancer research, have been announced from the National Cancer Institute through the Federal Security Administration.

In New York State, grants received include Albany Medical College, $3,888, and University of Rochester, $1,230 In New York City, the grants are Fordham University, $9,800, Columbia University, College of Physicians and Surgeons, $7,560, Memorial Hospital, $98,508, Barnard College, $1,800, and Mount Sinai Hospital, $16,200

Medical Center Receives Eight-Million Dollar Grant

THE New York University-Bellevue Medical Center has received a gift "in excess of $8,000,000" from the Samuel H Kress Foundation, it was announced on January 10 The terms of the grant stipulate that it will be devoted to the development at the Center of a program of postgraduate medical education which will be national and world-wide in scope, and which will require a decade to work out on a constructive basis

Of the total grant by the Kress Foundation to the Medical Center, approximately $4,000,000 will be made available as capital funds for construction of postgraduate facilities in the new buildings A second $4,000,000 from the Kress grant will be earmarked as support for a program of postgraduate medical teaching by outstanding physicians and surgeons

The new Post-Graduate Medical School, which now has the support of the Samuel H Kress Foundation, has its own faculty and dean, with an analytical program for a model organization and administrative responsibility It will function in association with the University's hundred-year-old College of Medicine, which will continue to specialize in the training of medical students for their M D degrees In addition to the two medical schools, the Medical Center has in operation its Institute of Rehabilitation, an Institute of Industrial Medicine, the University Clinic, and the University Hospital (formerly Post-Graduate Hospital)

MEDICALLY SPEAKING—

American Board of Obstetrics and Gynecology—The next written examination and review of case histories (Part I) for all candidates will be held in various cities of the United States and Canada on Friday, February 4, 1949

Arrangements will be made so far as is possible for candidates to take the Part I examination (written paper and submission of case records) at places convenient for them Candidates who successfully complete the Part I examination proceed automatically to the Part II examination to be held May 8 to 14, inclusive, 1949, at the Hotel Shoreland, Chicago, Illinois Notice of the exact time and place of the Part I and Part II examinations will be sent all candidates well in advance of the examination date Closing date for reapplications for admission to the Part II examinations will be April 1, 1949

New bulletins are now available for distribution upon application and give details of all changes in Board requirements and regulations made at the annual meeting of the Board held in Washington, D C, May 16 to May 22, 1948 These relate both to candidates and to hospitals conducting residency services for training

Application forms and bulletins are sent upon request made to American Board of Obstetrics and Gynecology, Inc., 1015 Highland Building, Pittsburgh 6, Pennsylvania.

Leaves Funds for Research—Ernest L Woodward former head of the Jell-O Company, who died last year, left $2,198,571 54 to the University of Rochester for medical research He also left $250,000 to the Genesee Memorial Hospital in Batavia, and $50,000 to St Mark's Episcopal Church in Le Roy, his home

Postgraduate Course on Diabetes—The Frank E Bunts Educational Institute and Cleveland Clinic will present a continuation course for physicians entirely devoted to the diagnosis and management of diabetes and its complications, to be held on March 17 18, and 19 Dr Henry T Ricketts of Chicago, Dr John S L Browne of Montreal, and Dr H L C Wilkerson of the United States Public Health Service will be guest speakers Dr E Perry McCullagh is director of the course

Inquiries regarding the complete program and registration may be addressed to the Director of Education, Frank E Bunts Educational Institute, 2020 East Ninety-third Street, Cleveland 6, Ohio

Fellowships in Exfoliative Cytology—The American Cancer Society announces that fellowships are available for advanced training in diagnostic technic in exfoliative cytology for qualified pathologists Six of these are at the Cornell University Medical College, under the direction of Dr George N Papanicolaou, and one at the New York University Hospital, under Dr Locke L MacKenzie Applications should be made directly to the institutions where the fellowships are available

Surgery Course to Be Offered—A postgraduate course in orthopedic surgery will be offered by the Hospital for Joint Diseases, 1919 Madison Avenue, New York City, in affiliation with the College of Physicians and Surgeons, Columbia University The course will comprise eleven morning and eleven afternoon sessions on consecutive Thursdays, beginning March 3, held at the Hospital Physicians may apply for registration at the office of the Assistant Dean, Graduate Medicine, College of Physicians and Surgeons

National Heart Campaign Set—National Heart Week in 1949 has been designated as the week of February 14 to 21, a period of intensified public education and fund raising within the national campaign of the American Heart Association, February 7 to 28

Propose Law for Rh Factor—A bill to require the testing of blood of expectant mothers for the Rh factor is to be introduced into the 1949 State Legislature, according to State Senator Thomas C Desmond. Purpose of the bill, according to Senator Desmond, is to help avert the tragedies of stillbirths, deaths in infancy, and births of subnormal children, due to antagonistic Rh blood factors in the parents

MEETINGS

PAST

New York Council of Surgeons

Dr Anthony J Della Rocca, assistant surgeon at the Manhattan Eye, Ear and Throat Hospital and instructor in ophthalmology at the New York Polyclinic Medical School and Hospital, spoke on "Management of the Acute Congestive Eye" at a meeting sponsored by the New York Council of Surgeons, January 4 at the Parkchester General Hospital, New York.

Society of Medical Jurisprudence

At the meeting of the Society of Medical Jurisprudence held January 10 in New York City, Dr Harrison J Martland, professor of forensic medicine at the New York University-Bellevue Medical Center, spoke on "The Danger of Increasing the Normal Radioactivity of the Human Body," and Mr Edward Holloway gave the presidential address on "Medicine and the Law"

Saranac Lake Medical Society

Dr Gavin Miller, professor of surgery at McGill University, Montreal, spoke on "Recent Advances in Surgery of the Gastrointestinal Tract" at the meeting of the Saranac Lake Medical Society held January 12

Cancer Teaching Day

A cancer teaching day was held January 19 at the Hermann M Biggs Memorial Hospital, Ithaca, under the auspices of the Tompkins County Medical Society, the State Medical Society, the Tompkins County Department of Health, and the Bureau of Cancer Control of the State Department of Health.

Speakers and their topics included Dr Norman Treves, instructor in surgery, Cornell University Medical College, "Cancer of the Breast", Dr John S LaDue, assistant professor of clinical medicine, Cornell University Medical College, "Operative Risk and Pre- and Postoperative Care of Patients with Cancer", Dr Clyde L Randall, professor of gynecology, University of Buffalo School of Medicine, "Significance and Management of Abnormal Vaginal Bleeding," and Dr Albert F R Andresen, professor of clinical medicine, Long Island College of Medicine, "Gastrointestinal Cancer"

PERSONALITIES

Honored

Dr James M Cronk, Hyde Park, at a testimonial dinner held on December 15, marking his completion of fifty years of the practice of medicine in the Hyde Park area, where he established his practice in October, 1898 Dr Wilbur A Sawyer, first director of health for the United Nations Relief and Rehabilitation Administration, who received the 1948 Richard P Strong Medal for distinguished service in tropical medicine, at the annual dinner of the American Foundation for Tropical Medicine, January 13 in New York City

Awarded

One of the first two fellowships in clinical cancer research under the Damon Runyon Memorial Fund, to Dr Genevieve Mary Bader, New York City, clinical assistant at the Strang Cancer Prevention Clinic Dr Irving Rappaport, instructor at the Long Island College of Medicine, a fellowship for medical research at the College, from the Benson Memorial Fund Dr Harold Wiggers, Albany Medical College, a $2,700 grant from the American Foundation for High Blood Pressure for research in high blood pressure and hardening of the arteries

Appointed

Dr Henry S Di Stefano, Syracuse, as instructor in the department of anatomy Syracuse University College of Medicine Dr Merwin E Marshland Mamaroneck, to the Westchester County Board of Health Dr D Frank Milam, formerly with the International Health Division of the Rockefeller Foundation, as national director of the Planned Parenthood Federation Dr George M Wheatley, as third vice-president of the Metropolitan Life Insurance Company, to supervise the company's health and welfare activities

Elected

Dr George Baehr, retiring president of the New York Academy of Medicine, as chairman of the board of directors of the Health Insurance Plan of Greater New York Dr Rustin McIntosh, director of the pediatric service, Presbyterian Hospital, as 1949 chairman of the American Council on Rheumatic Fever of the American Heart Association Dr McIntosh is also Carpenter Professor of Pediatrics at the College of Physicians and Surgeons, Columbia University

Speakers

Dr I D Bobrowitz, medical superintendent of the New York City Municipal Sanatorium, Otisville, on "The Prognosis and Treatment of Minimal Tuberculosis" at a meeting of the Society of the New York Medical College on December 21 Dr John J Levbarg, New York City, on "The Use of Hypnosis in Dentistry" at a meeting of the Tenth District Dental Society January 26 in Hempstead Dr Joseph Earl Moore, Johns Hopkins Hospital, Baltimore, on "Office Management of the Patient with Syphilis" at the weekly seminar on venereal disease control February 19 at 10 30 A M at the New York City Department of Health, 125 Worth Street, Manhattan Dr Howard A Rusk, chairman of the department of rehabilitation and physical medicine at the New York University College of Medicine, on a program of rehabilitation for the victim of multiple sclerosis, at the annual conference of the Association for Research in Nervous and Mental Diseases, December 11 in New York City

New Offices

Dr Fisk Brooks, formerly in Delhi, general practice in Oneonta Dr Donald F Harrington, World War II Navy veteran, general practice in Seaford

COUNTY NEWS

Bronx County

The importance of increased cooperation between the medical profession and United Medical Service, the Doctor's Plan, was discussed at the regular monthly meeting of the Physician's Group of Bronx County, held December 14 at the Concourse Plaza Hotel. A talk on the health needs of the community was given by State Senator Arthur Wachtel. Other speakers were Dr Frederick E Elliott, Mr John McCormack, and Mr Alfred L Golden, vice-presidents of U M S

Broome County

A panel of doctors that can be called in an emergency at any time of day or night has been set up by the Broome County Medical Society for persons whose own doctors are unavailable when an emergency arises

A special committee on Problems of Alcoholism has been appointed from the Broome County Medical Society, as follows Dr Herman M Hurdum, chairman, Dr Harry L. Fulton, Dr Charles A Mossew, Dr Karl D Rundell, Dr John D Tocco, and Dr J C Zillhardt

Chemung County

Dr M F Butler was elected president of the Chemung County Medical Society at the annual meeting held December 15 in Elmira Other officers chosen are Dr A. H. Hillman, vice-president Dr J A. Mark, treasurer, and Dr J J McConnell, secretary

Clinton County

Dr Howard T Behrman, assistant clinical professor of dermatology and syphilology, New York University College of Medicine, will speak on "Modern Treatment of Skin Diseases" at the meeting of the Clinton County Medical Society to be held Thursday, March 17, at 8 30 P M. at the Champlain Valley Nurses' Home, Plattsburg The program is postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Society, with the cooperation of the State Department of Health

The December and January meetings of the Clinton County Medical Society also included postgraduate instruction programs On December 14, Dr Paul A. Bunn, associate professor of medicine at the Syracuse University College of Medicine, spoke on "Problems in Physical Diagnosis," and on January 20, Dr A. Wilbur Duryee, chief of the peripheral vascular clinic at the New York Post-Graduate Hospital, spoke on "Management of Peripheral Vascular Diseases"

Dutchess County

At the January 12 meeting of the Dutchess County Medical Society, held at the Hudson River State Hospital, Poughkeepsie, Dr C Stuart Welch, professor of surgery at Tufts Medical College, spoke on "Surgery of the Biliary Tract"

Erie County

Officers for 1949 were installed at the meeting of the Erie County Medical Society held January 25, and Dr Roy L Scott, new president, gave his inaugural address Other officers are Dr Stephen A. Graczyk, first vice-president Dr Elmer T McGroder, second vice-president Dr Mary J Kazmierczak, secretary, and Dr Walter Scott Walls, treasurer

Franklin County

New officers were elected at the annual meeting of the Franklin County Medical Society, held December 8 at Saranac Lake Dr Carter Morse, Tupper Lake, is president, succeeding Dr Alfred A. Hartmann Other officers are Dr Warriner Woodruff, Saranac Lake, vice-president, and Dr Daisy H Van Dyke, Malone, secretary-treasurer

Fulton County

"Operative Deliveries The Occipitoposterior Position" was the topic of a program of postgraduate instruction presented by Dr Raymond J Pieri, professor of clinical obstetrics at the Syracuse University College of Medicine, at the meeting of the Fulton County Medical Society held January 20 in Johnstown The program was arranged by the Council Committee on Public Health and Education of the State Society, with the cooperation of the State Department of Health

Kings County

A scientific program on "Atomic Fission Injuries" was presented at the meeting of the Kings County Medical Society, held December 21 in Brooklyn Speakers and their topics included Dr James C Barnett, department of radiology, Long Island College Hospital, "The Injuring Force", Dr Phillip E Lear, assistant professor of clinical surgery, Long Island College of Medicine, "Somatic Injuries", Dr Joseph DiPalma, assistant professor of medicine, Long Island College of Medicine, "Genetic Injuries," and Dr Howard W Brondum, fellow in radiology Long Island College Hospital, "Protection Against Injury"

Livingston County

Dr Kenneth Diehl of Rochester spoke at the annual meeting of the Livingston County Medical Society on December 16 His topic was "Oral Endoscopy"

Nassau County

Dr Arthur D Jaques, Lynbrook, and Dr Louis H Bauer, Rockville Center, were guests of honor at the annual dinner-dance of the Nassau County Medical Society, held December 11 in Garden City Dr Jaques was named by the Medical Society of the State of New York as its nominee for the American Medical Association's award as "General Practitioner of 1948," and Dr Bauer was recently named secretary-general of the World Medical Society

Niagara County

Dr Walter Walls, University of Buffalo School of Medicine, spoke on "Present Day Treatment of Burns" at the meeting of the Niagara County Medical Society held January 11 in Lockport

Onondaga County

As a program of postgraduate instruction, Dr Marcy L Sussman, clinical professor of radiology at the Columbia University College of Physicians and Surgeons, spoke on "Recent Radiologic Contributions to the Study of Heart Disease" at the meeting of the Onondaga County Medical Society, on February 1 in Syracuse The instruction was arranged by

the Council Committee on Public Health and Education of the State Medical Society, with the cooperation of the State Department of Health.

Queens County

At the annual meeting of the Queens County Medical Society, held November 30, Dr Arthur A. Fischl of Astoria succeeded Dr Alfred Angrist, Jamaica, as president Officers chosen included Dr Ezra A Wolff, Forest Hills, president-elect Dr William Benenson, Flushing, secretary, Dr Ernani D'Angelo, Jamaica, assistant secretary, Dr Carl Krenz, Flushing, treasurer, and Dr John Lowry, assistant treasurer

Rensselaer County

At the annual meeting of the Rensselaer County Medical Society, held December 15 in Troy, officers were elected, and a talk was given by Mr E R. Schooley, New York City, insurance manager of the Pinkerton Detective Agency

Richmond County

Dr Louis H Bauer, past-president of the Medical Society of the State of New York and secretary of the World Medical Society, will speak on "Socialized Medicine" at the joint meeting of the Richmond County Medical Society and its Woman's Auxiliary, to be held Wednesday, March 9, at the Atlantic Inn, Staten Island The program, which is postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Society, with the cooperation of the State Department of Health, will begin at 9 00 P M

Rockland County

Dr John J Rooney, Jr , Nyack, was elected president of the Rockland County Medical Society at the annual meeting held December 1 at the Summit Park Sanatorium Other officers chosen are Dr A J Maged, Suffern, vice-president, Dr Marjorie R. Hopper, Nyack, treasurer, and Dr Robert L Yeager, Pomona, secretary

St Lawrence County

Officers elected to head the St Lawrence County Medical Society for this year are Dr R V Persson, Newton Falls, president, Dr A D Burr, Gouverneur, vice-president, Dr W R Carson, Potsdam, secretary, and Dr L T McNulty, Potsdam, treasurer

Schenectady County

Dr Stuart MacMillan was elected president of the Schenectady County Medical Society at the annual dinner and election held December 9 in Schenectady Dr William Mallia was elected vice-president, Dr Ralph E Isabella, secretary, and Dr Harry Miller, treasurer At the meeting the guest speaker was Mr Scott Dickson of the General Electric Company, whose topic was "Feats of Magic."

At the January 4 meeting, Dr Evan W Thomas, director of the rapid treatment center, New York University-Bellevue Hospital, spoke on "The Treatment of Syphilis with Penicillin"

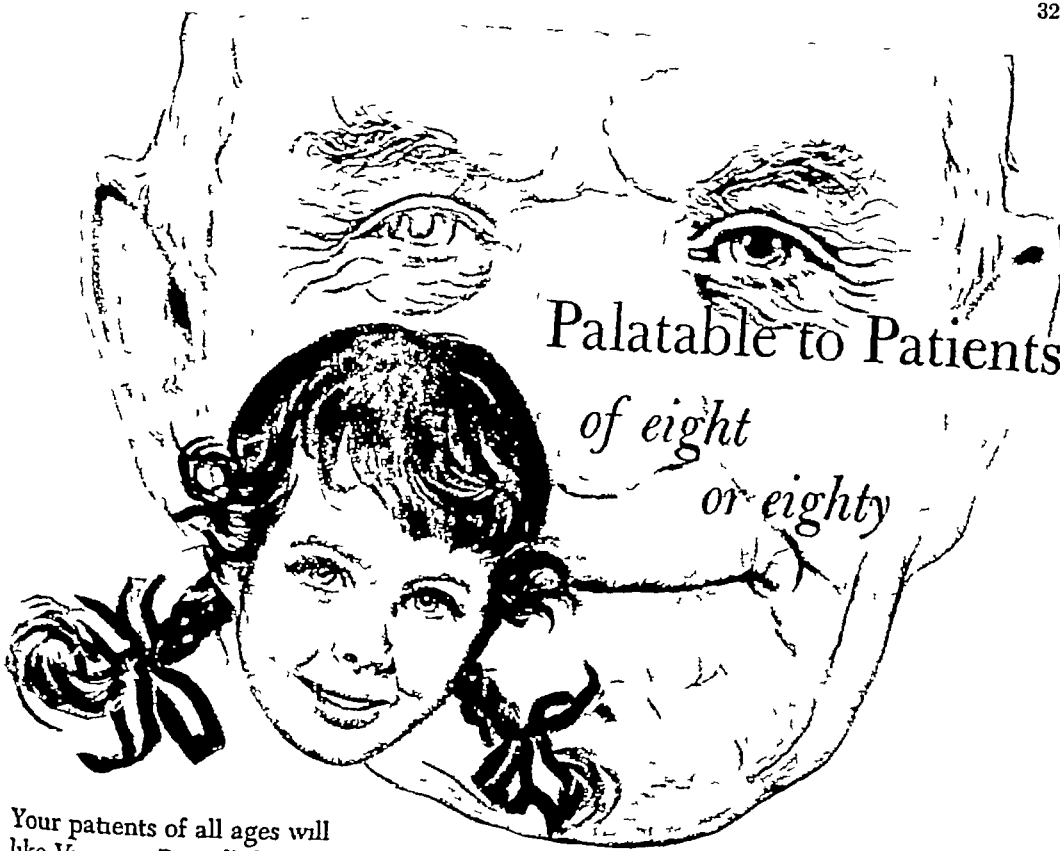
Suffolk County

Dr Gaylord W Graves, clinical professor of pediatrics, New York University College of Medicine, spoke on "Problems of Practice in the First Year of Life" at the meeting of the Suffolk County Medical Society, held January 26 in Patchogue The program was postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Medical Society, with the cooperation of the State Department of Health

Wayne County

At the annual meeting of the Wayne County Medical Society, held December 14, in Lyons, election of officers was held, and annual reports were given The guest speaker was Dr James Quinlivan, assistant director of local health services of the State Department of Health, whose topic was "What an Independent County Health Department Has to Offer"

Westchester County



Reorganization of the board of directors of the Westchester County Laboratory, with expansion to nine members, was recommended to the supervisors by County Executive Herbert C Gerlach Serving on the laboratory board are Dr Edwin G Ramsdell, White Plains, Dr William A. Holla, county health commissioner, both ex-officio members, Dr G C Adie, New Rochelle Dr Christopher Wood, White Plains, Dr Margaret Loder, Rye, Dr Reid R. Heffner, New Rochelle, Dr E L Harmon, Grasslands Hospital medical director, Dr M D Touart, Bronxville, and Dr Lester R. Stewart, Scarsdale

Officers of the Westchester County Medical Society for this year, elected at the annual meeting held November 16 in White Plains, are Dr Waring Willis, Bronxville, president, Dr Christopher Wood, White Plains, president-elect, Dr Henry E McGarvey, Bronxville, vice-president, Dr Margaret M. Loder, Port Chester, secretary, and Dr David Fertig, Hartsdale, treasurer

At the meeting of the Westchester Division, Podiatry Society of New York, held November 23 in White Plains, the program presented included a symposium on "Arthritis of the Lower Extremities" Speakers were Dr M S Rednick, Ossining, and Dr Emanuel Frankel, Richmond Hill

Palatable to Patients

of eight

or eighty

Your patients of all ages will like VYTINIC, Bristol's liquid hematinic with folic acid A clear, transparent solution, it is pleasing to the eye, and exceedingly well tolerated. But most important, VYTINIC's exceptional appeal to a finicky palate ensures your patients' co-operation

The approach of VYTINIC to the treatment of secondary anemia is modern and comprehensive—providing in balanced proportions essential factors certainly deficient in hemorrhagic anemia and frequently deficient in anemias of nutritional origin

Prescribe VYTINIC for your anemia patients, and note how willingly they follow your dosage instructions—and how hemoglobin responds in consequence

Each fluidounce contains

Ferric Ammonium Citrate, USP	390 mg
Thiamin Hydrochloride (Vitamin B_1)	10 mg
Riboflavin (Vitamin B_2)	4 mg
Niacinamide	100 mg
Liver extract derived from 20 Gm. of fresh liver	
Folic Acid	2 mg

Available for your prescription in bottles of 12 oz. and 1 gal
Send for tasting sample

Vytinic *with folic acid*

Bristol Laboratories trademark for an oral hematinic

Dosage *Adults—one tablespoonful, t i d , with or immediately after meals Children—in proportion to their age The suggested daily adult dose provides the following multiples of the minimum daily requirement for adults iron—10, vitamin B_1—15, vitamin B_2—3, plus adequate amounts of niacinamide, liver extract, and folic acid*

Here's why you get quick results with this intranasal sulfonamide

A superior vasoconstrictor plus a potent bacteriostatic agent make Paredrine-Sulfathiazole Suspension the amazingly effective intranasal preparation that it is

Its vasoconstrictor— Paredrine Aqueous'—is one of only two proprietary vasoconstrictors favorably noted in a report recently issued for the information of the Mayo Clinic staff It produces rapid, complete and prolonged shrinkage—with no central nervous effects

This superior vasoconstrictor—combined with S K F 's famous 'Microform' sulfathiazole—forms an outstanding preparation which is unusually effective in the treatment of nasal and sinus infections

A stable suspension of Microform (microcrystalline) sulfathiazole, 5%, in an isotonic solution of Paredrine (p-hydroxy a methylphenethylamine, S K F) hydrobromide, 1% Available in 1 fl oz. (30 cc) and 12 fl oz (355 cc) bottles

Smith, Kline & French Laboratories, Philadelphia

Tomorrow's Food. The Coming Revolution in Nutrition. By James Rorty and N Philip Norman, M D Large duodecimo of 258 pages New York, Prentice-Hall, 1947 Cloth, $3 50

This is a book for the layman It is of little clinical value to the practicing physician, as the material is of general interest and compiled mostly from government sources

There is too much emphasis placed on the quest for profit by food processing industries, the Council of Foods of the A M A comes in for some harsh remarks These remarks are unjustified The reviewer refers the authors to the last paragraph on page 244 of this book, relating to *Nutrition Reviews* "This monthly digest of nutritional literature can be read with profit by both food scientists and laymen Ably and objectively edited, it has already contributed substantially to nutrition progress as well as to the prestige and public acceptance of the aims and purpose of its sponsor the Nutrition Foundation "

The sponsors of the Nutrition Foundation are the food industry Their personnel in this foundation are well-known nutrition scientists who have enjoyed the confidence of the Council on Foods of the A M A and the National Research Council

M Ant

Jaundice Its Pathogenesis and Differential Diagnosis By Eli Rodin Movitt, M D Octavo of 261 pages, illustrated New York, Oxford University Press, 1947 Cloth, $6 50

This is a modern and up-to-date exposition of the subject which encompasses an abundant collection of useful information on this intriguing phenomenon Although such important topics as erythroblastosis and the Rh factors are not discussed, much practical knowledge is made available for the practicing physician, specialist or general practitioner, in dealing with this vexing problem in patients The colored plates, tables, illustrations, and prolific references are carefully selected and presented

ARMY PLANS STUDY OF MELANOMA

Major General Raymond W Bliss, surgeon general of the Army, has announced an intensive study of some 400 autopsy and surgical specimens of malignant melanoma. Having collected this material over a number of years, the Army Institute of Pathology is now preparing thousands of slides for an exhaustive study that may continue five or six years Pathologists and dermatologists of the Army Medical Department hope that findings will bring a complete histologic understanding of the disease, its manner of growth, and criteria for recognition of malignant melanoma in an early stage before it has become fatal

incidence of mastitis and other breast complications is reduced with the Plastishield Technic of Aseptic Breast Care

- Mastitis is frequently the result of excessive handling of breasts and nipples as well as insufficient cleanliness in postpartum breast care.
- Most cases of mastitis can be traced to nipple fissures or sore nipples which DeLee estimates affect more than half of all lactating women
- Many breast complications can be avoided when the use of PLASTISHIELDS begun in the hospital immediately after parturition is continued at home
- PLASTISHIELDS are clean simple to use and comfortably worn
- They are easily sterilized and prevent soreness cracking and fissuring of nipples.
- You are invited to write for further information on the PLASTISHIELD Technic of Aseptic Breast Care

Poisons Their Isolation and Identification By Frank Bamford, B Sc Second edition Revised by C P Stewart, M Sc Octavo of 304 pages, illustrated Philadelphia, Blakiston Co, 1947 Cloth, $5 00

This book will be useful to the forensic chemist in its discussion of the methods of various analyses for the identification of the usual poisons met with in medicolegal work The methods described have been found reliable through personal experience of the author

Since volatile and metallic poisons as well as fur dyes are also included, the book should also be of value to the industrial hygiene chemist A brief description of the pharmacologic action of numerous poisons is included, particularly of the alkaloids

NATHAN MILLMAN

Gynaecological Endocrinology For the Practitioner By P M F Bishop, D M (Oxon) Duodecimo of 124 pages, illustrated Baltimore, Williams & Wilkins Co, 1946 Cloth, $2 00

In this small volume, dealing with the endocrine aspects of gynecology, the author attempts to explain some of the fundamentals and clinical applications in both the male and female, avoiding the speculative and controversial

Although aware of the difficulties in the appraisal of the many hormonal preparations recommended to the general practitioner in the field of gynecology, the reviewer commends the author for his conservatism in his recommendations for treatment Too many glandular products have been empirically given for the cure of endocrine or so-called endocrine imbalance without controlled observations to evaluate their efficacy

This volume can be recommended as a compendium to gynecologic endocrinology for the general practitioner

SAMUEL L SIEGLER

The Treatment of Diabetes Mellitus By Elliott P Joslin, M D, Howard F Root, M D, Priscilla White, M D, Alexander Marble, M D, and C Cabell Bailey, M D Eighth edition Philadelphia, Lea & Febiger, 1946 Cloth, $10

The title of this book has always remained *The Treatment of Diabetes Mellitus* Everything of any interest related to diabetes mellitus is described completely and accurately, in a well-organized manner The volume has become a veritable Bible on diabetes

The new edition is revised with elaborate thoroughness The sections on alloxan diabetes, degenerative complications, insulin modifications, pregnancy, and related endocrine disorders are revised from a particularly modern point of view

The experience of Dr Joslin and his associates is spread over forty-eight years and covers about 29,000 diabetic patients

SAMUEL G SLO-BODKIN

An Introduction to Biochemistry By William Robert Fearon, M B Third edition Octavo of 569 pages, illustrated New York, Grune & Stratton, 1947 Cloth, $6 00

This work covers briefly the inorganic and biologic elements in the body, the major part of the book being devoted to descriptions of the chemistry and structure of the carbohydrates, proteins, amino acids, lipids, and steroids

The physiology of excretion, body fluids and blood is discussed The author gives a brief outline of the hormones This book is highly recommended

MORRIS ANT

Cornell Conferences on Therapy Volume 2 Editorial Board, Harry Gold, M D, Managing Editor Duodecimo of 354 pages, illustrated New York, Macmillan Co, 1947 Cloth, $3 75

The second volume in the series of *Cornell Conferences on Therapy* continues to be interesting and informative Many aspects of treatment are brought up to date in a most entertaining fashion

The first chapter on the use of placebos in therapy should be read by everyone The chapters on the treatment of edema are the best available summaries for the general practitioner

The volume is attractively printed and priced and can be highly recommended

MILTON PLOTZ

Histopathologic Technic By R D Lillie, M D Octavo of 300 pages Philadelphia, Blakiston Co, 1948 Cloth, $4 75

This volume contains many new technics in both staining and preparation of slides Although there are no illustrations, the reading is simple and the material concise

NATHAN REIBSTEIN

A Textbook of Medicine Edited by Russell L Cecil, M D, with the assistance of Walsh McDermott, M D Associate Editor for Diseases of the Nervous System, Harold G Wolff, M D Seventh edition Quarto of 1,730 pages, illustrated Philadelphia, W B Saunders Co, 1947 $12

This seventh edition is indeed a monumental work It contains 1,730 pages, 16 entirely new articles, and new treatises on 54 subjects previously covered As one looks over the list of contributors, their names and qualifications, one is impressed with the number of men whose names are among the leaders of American medicine One is also impressed with the authoritativeness of their contribution

The student must indeed have a "mens sana in corpore sano" to be able to carry the book around It weighs six pounds, ten ounces It is a book that must be anchored in the student's room

Since there are 136 specialists, no subject has been neglected nor stingily treated But since it also serves the general practitioner, that tendency is justifiable This work is now the outstanding textbook of medicine

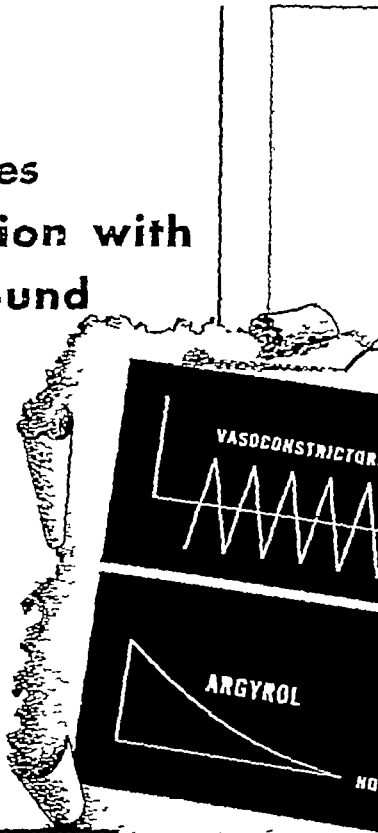
S R BLATTEIS

Osteotomy of the Long Bones. By Henry Milch, M D Octavo of 294 pages, illustrated Springfield, Ill, Charles C Thomas, 1947 Cloth, $6 75

This monograph brings under one cover a series of articles published by the author over a period of fifteen years

A relatively simple procedure technically, the surgical importance of osteotomy and its biomechanical implications are thoroughly and ingeniously demonstrated The mathematical discussions under the chapter on angulational osteotomy are understandably somewhat burdensome, but their practical application to osteoarthritis, fracture of the femoral neck, and tuberculosis of the hip, as well as to congenital and developmental defects of the hip, disclosures interesting contraindications and explains the reason for failure in poorly planned operations

Practitioners of bone surgery will find it an interesting and valuable contribution



MAX S RABINOWITZ

[Continued on page 328]

In Para-nasal Infection

ARGYROL promotes normal nasal function with no congestive rebound

Experience provides ample proof of ARGYROL's effectiveness and freedom from distressing after-effects notably congestive rebound and Rhinitis Medicamentosa ARGYROL effectively promotes the restoration of normal nasal function due to its excellent bacteriostatic, detergent and demulcent properties

The ARGYROL Technique

1. The nasal meatus by 20 per cent ARGYROL instillations through the nasolacrimal duct.
2. The nasal passages with 10 per cent ARGYROL solution in drops
3. The nasal cavities with 10 per cent ARGYROL by nasal tamponage.

Its Three-Fold Effect

1. Decongests without irritation to the membrane and without ciliary injury
2. Definitely bacteriostatic yet non toxic to tissue.
3. Stimulates secretion and cleanses, thereby enhancing Nature's own first line of defense

ARGYROL — *the medication of choice in treating para-nasal infection*

Communicable Disease Control. By Gaylord W Anderson, M D, and Margaret G Arnstein, R N Second edition Octavo of 450 pages, illustrated New York, Macmillan Co, 1948 Cloth, $5 00

Written for the student of public health, this book is a clear concise résumé of the principles of disease control as applied to some twenty-five communicable diseases or groups of diseases

During the seven years that have passed since the first edition, many changes have occurred in the regulation, prophylaxis, and treatment of these diseases

An informal style makes the book such pleasant and easy reading that every practitioner will enjoy it and will gain much practical, valuable knowledge from its perusal KENNETH G JENNINGS

400 Years of a Doctor's Life Collected and Arranged by George Rosen, M D, and Beate Caspari-Rosen, M D Octavo of 429 pages New York, Henry Schuman, 1947 Cloth, $5 00

Here is a collection of passages, mostly autobiographic, illuminating the lives of many doctors of the past four centuries The selections are grouped in various sections showing the doctor as youth, student, practitioner, teacher, lover, patient, soldier, writer, etc There is not a dull page in the collection and one will read with the greatest interest about Theophrastus in the sixteenth century and about Seagrave, Heiser, and many others of the present day One could only wish that some of the selections had been longer, but readers will certainly be moved to go to the original sources themselves MILTON PLOTZ

The Oculorotary Muscles. By Richard G Scobee, M D Octavo of 359 pages, illustrated St Louis, C V Mosby Co, 1947 Cloth, $8 00

As the author states in his preface, this book is the outgrowth of a series of lectures given to graduate students in ophthalmology, hence its appeal will be to them and to ophthalmologists of all ranks rather than to the undergraduate student or to the general practitioner Though it is true that a thorough understanding of the oculorotary muscles, of their anatomy, and especially of their physiology, renders fairly simple the diagnosis of their defects and deviations, yet the subject must be considered a really complex one, and any contribution which adds to its understanding and simplification is welcome To the reviewer this book appears to be definitely such a contribution

It is clearly printed on excellent quality paper, is adequately though not profusely illustrated Any reader will find his understanding of the oculorotary muscles increased to a marked degree by this volume, which, therefore, is recommended to the ophthalmologist and graduate student in ophthalmology E CLIFFORD PLACE

The Diagnosis and Treatment of Diarrheal Diseases By William Z Fradkin, M D New York, Grune & Stratton, 1947 Cloth, $6 00

This book summarizes the common and rarer causes of chronic diarrhea. It is most helpful in its insistence upon simple yet adequate diagnostic procedures before the cause has been masked by treatment It is, however, not without its faults and may confuse the general practitioner There is no objective summary of the relative frequency of the common chronic diarrheas of civil practice The presentation entitled "Glandular Diarrheas" is especially vulnerable and controversial Despite these faults, however, the book is valuable for its exposition of methods of diagnosis available to all medical practitioners ALFRED R LENZNER

Rheumatism and Soft Tissue Injuries By James Cyriax, M D Octavo of 410 pages, illustrated New York, Paul B Hoeber, 1948 Cloth, $9 50

This book by James Cyriax, physician in charge of the physiotherapy department of St Thomas' Hospital, London, is a controversial volume, particularly with reference to referred pain in segmental areas It has numerous plates, supernumerary

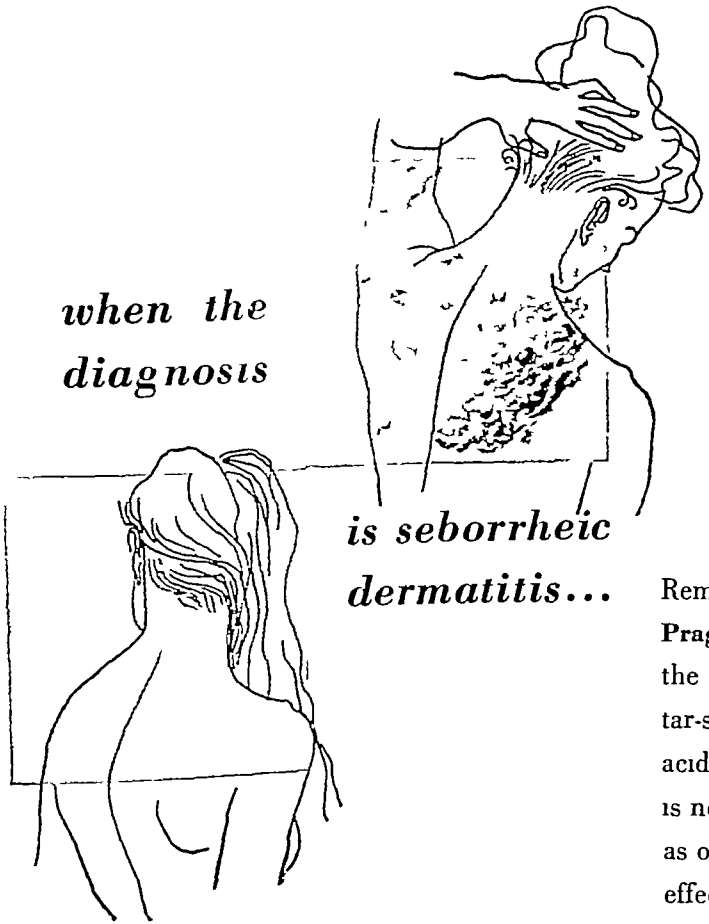
The reviewer would say it is a good book for the physician in physical medicine to read, to evaluate, before pronouncing it a good book for the medical profession or the technical physiotherapist JOHN J HAUFF

Diseases of the Nervous System. Described for Practitioners and Students By F M R Walshe, M D Fifth edition Octavo of 351 pages, illustrated Baltimore, Williams & Wilkins Co, 1947 Cloth, $4 50

In reading this book one is most favorably impressed with its orderliness, method of presentation, and the thoroughness with which the author covers the subject It is simple yet complete, contains basic concepts and the most accepted views regarding etiology, pathology, and modern forms of treatment of the different neurologic disorders Its very simplicity, yet thoroughness, makes it a useful text for students The last edition contains numerous figures and illustrations which greatly enhance the usefulness of the book IRVING J SANDS

Public Health Law By James A Tobey, Dr P H Third edition Octavo of 419 pages New York, Commonwealth Fund, 1947 Cloth, $4 50

Tobey brings this standard work up to date in a third edition His knowledge of both public health and law qualifies the author in this subject This book is intended primarily for public health teachers and administrators, as well as for lawyers A E SHIPLEY



Psychiatric Research. Papers Read at the Dedication of the Laboratory for Biochemical Research, McLean Hospital, Waverley, Massachusetts, May 17, 1946 By Cecil K Drinker, M D, Jordi Folch, M D, Stanley Cobb, M D, *et al* Octavo of 113 pages, illustrated Cambridge, Harvard University Press, 1947 Cloth, $2 00 (Harvard University Monographs in Medicine and Public Health)

This small book is a compilation of six addresses delivered on the occasion of the dedication of a laboratory for biochemical research in psychiatry at the McLean Hospital, Waverley, Massachusetts

The keynote of these papers, written by eminent authorities in the domain of neuropsychiatry, stresses the need of supplementing clinical studies of psychiatric problems with the technics of biophysical findings Their hope is piously expressed that the search for metabolic equivalents of normal and abnormal mental functions will ultimately establish objective criteria and fundamental causes of discrete psychiatric processes

All the addresses are erudite and authentic commentaries on modern trends in psychiatry, worth reading by everyone interested in the frontiers of psychiatric research SIMON ROTHENBERG

when the diagnosis is seborrheic dermatitis...

Pragmatar

Highly effective in an unusually wide range of common skin disorders

FORMULA cetyl alcohol coal tar distillate, 4% near-colloidal sulfur, 3%, salicylic acid, 3%—incorporated in a special washable base
Available in 1½ oz jars

Remember that **Pragmatar**—the outstanding tar-sulfur salicylic acid ointment—is now recognized as one of the most effective preparations available for the treatment of seborrheic dermatitis, and particularly for the general care and hygiene of the seborrheic scalp

Pragmatar is also extremely useful in fungous infections, eczematous eruptions, psoriasis and pityriasis rosea

Smith, Kline & French Laboratories, Philadelphia

[Continued from page 326]

Petticoat Surgeon By Bertha Van Hoosen Octavo of 324 pages Chicago, Pellegrini & Cudahy, 1947 Cloth, $3 75

We hope that all woman doctors will read this life of effort and accomplishment—and we advise the doctors of the other sex not to disregard its medical and administrative implications and teachings Dr Van Hoosen was brought up on a farm in Michigan and tells interestingly of her early years She was graduated in arts and medicine from the University of Michigan, and the year 1947, the date of the printing, finds the doctor still functioning at the age of 84 The jacket blurb tries to make something of her trials and tribulations as a "hen medic," but it would seem that the doctor herself concedes that her problems may have been complicated by her "redheadedness" JOSEPH RAPHAEL

Stereoscopic Atlas of Neuroanatomy By H S Rubinstein, M D , and C L Davis, M D Quarto of 43 plates, and descriptive pamphlet of 19 pages Illustrated New York, Grune & Stratton, 1947 $10, set

This work consists of 43 stereoscopic photographic plates with a companion guide to enable one to correlate the figures with dissections There are demonstrations of the central nervous system's development as well as views of the gross external and internal structures of the brain A few photographs lack clarity, as in some of those portraying the basal ganglia.

This atlas can be highly recommended to all who desire to study the spatial configuration of the various parts of the brain

ARTHUR J LAPOVSKY

Skeletal Tuberculosis. By Vicente Sanchis-Olmos, M D Translated by John G Kuhns, M D Octavo of 261 pages, illustrated Baltimore, Williams & Wilkins Co , 1948 Cloth, $5 00

This Spanish author describes in detailed and illuminating fashion the pathogenesis and pathology of bone tuberculosis He divides bone tuberculosis into three types, granular, exudative, and caseous osteitis The pathology of each type is illustrated with slides, x-rays, and clinical findings The author contrasts the methods of treatment and clinical concepts of two continents

In Part II, various parts of the skeleton, such as the head and face, elbow, wrist, spine, etc , are discussed separately CARMELO C VITALE

Essentials of Pharmacology By Frances K. Oldham, Ph D , F E Kelsey, Ph D , and E M K Geiling, Ph D Duodecimo of 440 pages, illustrated Philadelphia, J B Lippincott Co , 1947 Cloth, $5 00

The authors and collaborators have produced a most exhaustive and scholarly treatise on one of medicine's many specialties Reading it with considerable mental indigestion, one realizes that pharmacology has become one of medicine's most keen-edged tools, to be used cautiously and skillfully but with confidence when one has mastered it

The crude science of Hippocrates, the dogmatism of Galen, the practicality of Paracelsus, the spade work of Karl Binz and Rudolf Bucheim resulted in the founding of the first chair of pharmacology at the University of Dorpat in 1849 This and its continuation to the present time is all covered most painstakingly The new and most complex story of the sulfas, penicillin, hydrolysates amino acids and their production and disposal in the body chemistry, is a volume in itself It is a most versatile and authoritative work THOMAS F NEVINS

Dr Samuel Guthrie, Discoverer of Chloroform, Manufacturer of Percussion Pellets, Industrial Chemist (1782–1848) By Jesse Randolph Pawling, M D Octavo of 123 pages, illustrated Watertown, N Y , Brewster Press, 1947 Cloth, $3 50

This is a good biography of an interesting man, Dr Samuel Guthrie, 1782–1848, who practiced medicine in Sackets Harbor, Jefferson County, New York, and found time to be a good chemist. At his home is a New York State Education Department marker saying "Home of Dr Samuel Guthrie, Discovered Chloroform, 1831, Invented Percussion Caps, Surgeon in War of 1812" Chloroform was in use in general anesthesia, within seven teen years of its discovery by Sir James Young Simpson of Edinburgh, although Dr Guthrie had previously demonstrated its anesthetic powers and surgical application under the popular names of "Sweet whiskey" and "Guthrie's sweet whiskey" The priority of his discovery of chloroform in a pure form seems to be conceded

Dr Guthrie was evidently a chemist of considerable ability and communicated the results of his experiments to Professor Silliman of the department of chemistry of Yale University His interest in the manufacture of gunpowder led to his production of "priming powder" in the form of pellets or pills, although, as the author states, it is quite erroneous to designate Dr Guthrie as the inventor of the "Percussion Cap" JOSEPH RAPHAEL

Case Histories in Clinical and Abnormal Psychology Edited by Arthur Burton, Ph D , and Robert E Harris, Ph D Octavo of 680 pages, illustrated New York, Harper & Bros , 1947 Cloth, $4 00

This book is a compilation of case histories in clinical and abnormal psychology by a number of workers in this field who have demonstrated that clinical psychologists can employ useful technics in order to make diagnosis and prognosis in practically every type of case known in the field of psychiatry

The book contains many cases that will be of considerable interest to those psychiatrists and psychiatric social workers who work with clinical psychologists toward the synthetic approach to the understanding of human personality that is provided by their combined efforts SIMON ROTHENBERG

Rhinoplasty and Restoration of Facial Contour With Special Reference to Trauma. By Jaques W Mahmac, M D Octavo of 327 pages, illustrated Philadelphia, F A Davis Co , 1947 Cloth, $7 50

Rhinoplasty and Restoration of Facial Contour brings up to date surgical procedures for restoration of external nasal deformities Special emphasis has been placed on the early diagnosis and modern treatment of nasal injuries Reconstructive technics suggested for the various types of nasal deformities are fully described and made practical through the means of descriptive drawings and photographs It is an excellent book for those interested in rhinoplastic problems GERALD R. O'BRIEN

Psychotherapy in Child Guidance By Gordon Hamilton Octavo of 340 pages New York, Columbia University Press, 1947 Cloth, $4 00

This book presents a complete study of the child

[Continued from page 328]

guidance program of the Jewish Board of Guardians in New York Various types of problems are presented and the author then demonstrates how they are handled through a utilization of educational, social, and therapeutic principles, psychoanalytically oriented

For physicians interested in the field of psychotherapy in child guidance, this book should be useful

STANLEY S LAMM

A Text-Book of Bacteriology By R W Fairbrother, M D Fifth edition Octavo of 480 pages, illustrated New York, Grune & Stratton, 1948 Cloth, $6 00

This textbook concentrates on the medical aspects of bacteriology It is thoroughly revised, and deals with bacteria as agents of disease in man and with the application of bacteriologic methods in the prevention, diagnosis, and treatment of disease It incorporates the many important developments in bacteriology that have taken place in recent years It is strongly recommended as an up-to-date, well balanced and clearly expressed account of the accepted teachings in bacteriology

EDWARD H NIDISH

Textbook of Medicine By Various Authors Edited by Sir John Conybeare, D M (Oxon) Eighth edition Octavo of 1,170 pages, illustrated Baltimore, Williams & Wilkins Company, 1947 Cloth, $8 00

To put much into a textbook of medicine and still keep it within 1,170 pages is an art, and that Conybeare and his sixteen English associates have accomplished This is established by the fact that the volume is now in its eighth edition since 1929

Of convenient size and weight, it is often the first to be consulted in the doctor's office Naturally one must not expect too much in details A broad and valuable scope in dealing with disease is maintained, in consequence of which the book has special value for quick and ready reference FRANK B CROSS

Prophet in the Wilderness. The Story of Albert Schweitzer By Hermann Hagedorn Octavo of 221 pages, illustrated New York, Macmillan Co, 1947 Cloth, $3 00

This is a well-written biography on the life of Dr Albert Schweitzer, theologian and philosopher, one of the world's great medical men, who gave up the promise of a prosperous European career to devote his life as a jungle missionary doctor in French Equatorial Africa It is a very interesting and instructive story THOMAS B WOOD

Microbial Antagonisms and Antibiotic Substances By Selman A Waksman Revised edition Octavo of 415 pages, illustrated New York, Commonwealth Fund, 1947 Cloth, $4

This second edition of Dr Waksman's basic text on *Microbial Antagonisms and Antibiotic Substances* comes up to all expectations The distinguished discoverer of streptomycin here gives us a comprehensive, well-balanced survey of the field

Dr Waksman begins by discussing the influence of micro-organisms upon each other as they exist side by side in the soil and in other natural associations Particular stress is placed on antagonistic effects The bulk of the book is devoted to antibiotics, their recognition, production, and methods of assay, their chemistry and their chemotherapeutic and pharmacologic action

In a stimulating last chapter, he describes the methods used in the search for new antibiotics and discusses some of the problems of the future and the ways of solving them ARNOLD H EGGERTH

Modern Treatment of Peptic Ulcer By Asher Winkelstein, M D Octavo of 205 pages, illustrated New York, Oxford University Press, 1948 Cloth, $4 00

No book dealing with this subject can claim to have found the answer to this baffling problem The author, his enthusiasm understood and bias forgiven, expends much space in espousing his own procedure for treatment without offering adequate proof In a small volume he does cover thoroughly the present theories of etiology and methods of approach to therapy It appears to the reviewer that the acid-pepsin factor as the solution for the ulcer problem in treatment especially leaves, as the author notes in his 70 questions on pages 152 to 156, too many things unanswered

BENJAMIN M BERNSTEIN

How Life Is Handed On By Cyril Bibby, M A Octavo of 159 pages, illustrated New York, Emerson Books, 1947 Cloth, $2 00

Life is discussed in a simple manner which any child could understand Each age group is dealt with School teachers or instructors in the grade and high schools could well profit by a study of this volume It could readily be included in the course of study for teacher training Bibby puts in plain language the explanation of the problem of life, which has heretofore too often been obtained by our children in a garbled and lewd manner

ARTHUR D JAQUES

The Principles and Practice of Medicine Originally Written by William Osler, M D, F R C P. Designed for the Use of Practitioners and Students of Medicine By Henry L Christian, M D Sixteenth edition Octavo of 1,539 pages New York, D Appleton-Century Company, 1947 Cloth, $11

Now called Christian's *Practice*, but primarily Osler's in its sixteenth edition, this old friend in new dress presents a text of 1,381 pages, with an index of 156 pages One never tires of browsing in this fine volume, old and new facts are woven into a splendid presentation of internal medicine

The text is abreast of today's knowledge, and every effort is obviously made to hold to all that is good and of proved value and add suggestive ideas relative to new procedures in diagnosis and treatment

References are excellent The index is overextended for instance botulism, covered on parts of two pages, does not deserve a name reference and seven subreferences Re-editing can definitely improve this fault FRANK B CROSS

Teaching Psychotherapeutic Medicine An Experimental Course for General Physicians. Given by Walter Bauer, M D, Douglas D Bond, M D, Henry W Brosin M D *et al* Edited by Helen Leland Witmer, Ph D Octavo of 464 pages, illustrated New York, Commonwealth Fund, 1947 Cloth, $3 75

The impetus for this experiment came from a group of military and naval psychiatrists and medical educators who met at Hershey, Pennsylvania, in February, 1945, under the auspices of the National

Committee for Mental Hygiene and the Commonwealth Fund, to discuss the needs of veterans with psychoneurotic reactions This group agreed that care of such patients must be given primarily by general physicians They recommended that an experimental course be set up on a postgraduate level to explore the possibilities of educating the general practitioner for this responsibility

The material presented was compiled from stenographic notes obtained from the course which was given at the division of postgraduate education of the University of Minnesota Its down-to-earth style is highly recommended as a syllabus for the teacher of clinical psychiatry in our medical schools on an undergraduate level The dynamic mechanisms used by the various instructors in the interpretation of the patient's symptoms are Freudian in nature This is fairly consistent throughout the book Of course, this one-sided attitude leaves room for a great deal of doubt and skepticism in those of us who are less orthodox as to the value of the text Nevertheless, it is highly recommended for the clarity and uniqueness of presentation of a difficult subject

JOSEPH ZIMMERMAN

Diseases of the Joints and Rheumatism. By Kenneth Stone, M D Octavo of 362 pages, illustrated New York, Grune & Stratton, 1947 Cloth $6 50

This book, written in two sections, deals with diseases of joints as well as the diseases involving the soft-tissue structure about the joints The section on gout is well written It is a textbook which could be read with interest by the student of arthritis as well as by the orthopedist The illustrations are few but well chosen

IRVING GREENFIELD

Public Health Administration in the United States By Wilson G Smillie, M D Third edition Octavo of 637 pages, illustrated New York, Macmillan Co , 1947 Cloth, $6 50

The field of public health expands so rapidly that a textbook on this subject soon requires revision, therefore, the author publishes the third edition of his book Extensive changes have been made in the subject matter on the control of communicable diseases, housing, the use of insecticides, problems of nutrition, geriatrics, and industrial health

A E SHIPLEY

Gynecological and Obstetrical Urology By Houston S Everett, M D Second edition Octavo of 539 pages, illustrated Baltimore, Williams & Wilkins Co , 1947 Cloth, $6 00

The gynecologist will like the second edition of Everett's work, even though the problems associated with neoplastic disease calculus and tuberculosis receive more attention than ureteral injuries The technic of Kelly air cystoscopy is described in detail The Hopkins ideas on focal infection, ureteral stricture, and elusive ulcers of the bladder originally advanced by Hunner are well discussed

CHARLES A GORDON

The Philosophy of Insanity By a late inmate of the Glasgow Royal Asylum for Lunatics at Gartnavel Large duodecimo of 116 pages New York, Greenberg Publisher, 1947 Cloth, $2 50

This book, by an anonymous author, was first published in Glasgow in 1860 The author, who had recovered from a psychotic episode, was inspired to write his experiences while confined to a psychiatric hospital He stressed the principle that the difference between psychotics and normal patients is a quantitative rather than a qualitative one, and that thoughts and ideas which govern the conduct of psychotics were to be found in apparently normal people Written so long ago, it is truly remarkable that the author had possessed such a profound understanding of psychologic mechanisms

IRVING J SANDS

Practical Clinical Psychiatry By Edward A Strecker, M D , Franklin G Ebaugh, M D , and Jack R Ewalt, M D Section on Psychopathologic Problems of Childhood By Leo Kanner, M D Sixth edition Octavo of 476 pages, illustrated Philadelphia, Blakiston Co , 1947 Cloth, $5 00

This is a textbook for use by students of psychiatry and by psychiatrists for ready reference It deals with the mental diseases of childhood, middle age, and advanced life

Strecker, Ebaugh, and Ewalt have compiled a thorough study of psychiatry in this volume

ARTHUR D JAQUES

Physikalische Medizin in Diagnostik und Therapie By Wolfgang Holzer, M D Fifth and Sixth editions Octavo of 769 pages, illustrated Vienna, Verlag Wilhelm Maudrich (New York, Grune & Stratton), 1947 Cloth, $9 00 (Bucherei der Physikalischen Medizin, Band II)

This volume describes all methods of physical medicine—diagnostic and therapeutic The author has made the welcome attempt to correlate the applications of physical medicine with the modern concepts of physics and physiology The physiologic importance of the skin organ is emphasized throughout the book

Undoubtedly it should be of interest and value to all interested in physical medicine

H J BEHREND

Psychiatry for the Pediatrician By Hale F Shirley, M D Octavo of 442 pages New York, Commonwealth Fund, 1948 Cloth, $4 50

Not since Kanner's pioneering book, *Child Psychiatry*, published 1935, has there appeared such a readable and authoritative treatise as this most commendable book In some measure it is a compliment to Dr Kanner, since the author studied under the former and naturally radiates the fundamentals of child psychiatry as it became integrated with pediatric practice in the Harriet Lane Home at Johns Hopkins Hospital

The medical student, pediatrician, and general practitioner who desire a basic acquaintance with the working tools of child psychiatry could do no better than embrace this attractively written book

FREDERICK L PATRY

Plague Laennec (1782–1826) Inventor of the Stethescope and Father of Modern Medicine By Arthur N Foxe, M D Octavo of 122 pages, illustrated New York, Hobson Book Press, 1947 Cloth, $2 50

This well-written historical biography on the life of Laennec (1782–1826), inventor of the stethescope and father of modern medicine, is a most interesting book, both for its factual content and its choice literature Anyone interested in medical history should possess this important document Reader interest is kept alive from the first page to the last

a new approach to the cough problem

SYRUP URETHANE -MRT

(an original MRT contribution)

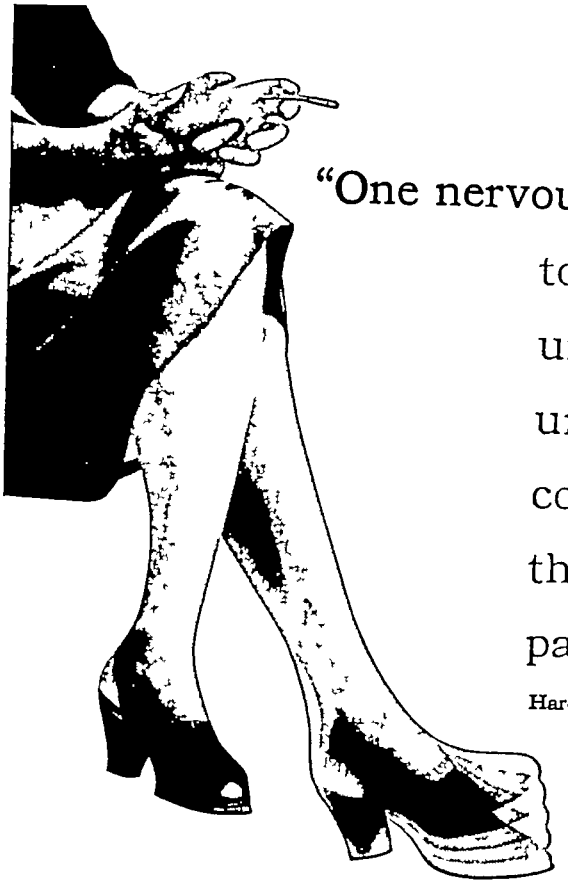
SYRUP URETHANE-MRT, a unique development of the Marvin R. Thompson, Inc. laboratories designed for the effective relief and control of coughs accompanying the common cold, bronchitis or other respiratory disorders.

SYRUP URETHANE-MRT IS EFFECTIVE because its action is direct — similar to that of codeine — but derived entirely from urethane, which by suppressing the overactive cough reflex provides speedy comfort, rest and relief

SYRUP URETHANE-MRT IS SAFE because unlike codeine, its hypnotic and/or sedative properties are negligible. Moreover, the active drug urethane is non-habit forming — non-toxic. Containing no alcohol, it is ideal for children, non-constipating and causes no gastric discomfort.

SYRUP URETHANE-MRT IS SIMPLE because it is a complete cough preparation unto itself—requiring no admixture with other expectorants to increase its effectiveness However it is ideally adapted for compounding with other agents if desired.

SYRUP URETHANE-MRT IS PLEASANT because it has a delightful taste and is pleasantly aromatic Its emerald green hue gives it "eye-appeal" as well.



Each teaspoonful (5 cc) contains Urethane, 4 Gr, in a flavored syrup base.

Directions One teaspoonful every 3 or 4 hours, or as directed by the physician

no coined names *specify* MRT *literature and samples on reques*

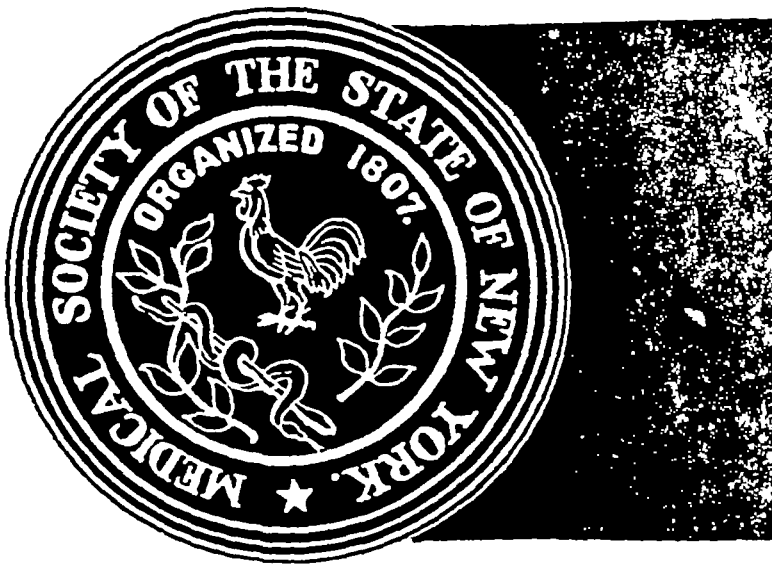
MARVIN R THOMPSON, INC

service to medicine • stamford, connecticu

"One nervous woman can give rise to more diverse, undiagnosed and undiagnosable complaints than a whole pathological ward"

Harding, T S M Rec 160 198, 1947

For the many patients, especially women, who complain of nervous tension throughout the day and wakefulness during the night, ESKAPHEN B ELIXIR is an ideal preparation



ESKAPHEN B ELIXIR provides both the calming action of phenobarbital (¼ gr per 5 cc) and the tone restoring effect of thiamine (5 mg per 5 cc)

Eskaphen B Elixir

The delightfully palatable combination of phenobarbital and thiamine

BACKGROUND

The use of cow's milk, water and carbohydrate mixtures represents the one system of

infant feeding, that consistently, for over three decades, has received universal pediatric

recognition No carbohydrate employed in this system of infant feeding enjoys so rich and enduring a background of authoritative clinical experience as Dextri Maltose

for perfection in matching

•

"Over Forty-five Years devoted to pleasing particular people"

Dramatic relief in Rheumatoid Arthritis . . . with a better tolerated salicylate

ELIXIR ALYSINE

A distinctive combination of Merrell's Natural Sodium Salicylate and Alkaline Salts

Containing natural sodium salicylate prepared solely from oil of sweet birch, together with selected alkaline salts, Alysine provides effective salicylate medication with a minimum of gastric irritation or systemic acidotic tendency

Used adjunctively with the sulfas, Alysine provides an alkaline (tolerance) factor, and at the same time helps to relieve muscular aches and pains

ELIXIR ALYSINE containing approximately 0 3 Gm (5 grs) natural sodium salicylate and 0 6 Gm (10 grs) alkaline salts per teaspoonful in 4 oz pint and gallon bottles

Also available as ALYSINE POWDER containing approximately 0 6 Gm (10 grs) natural salicylates and 1 2 Gm (20 grs.) alkaline salts per level teaspoonful in 1-oz., 4-oz. and 1 lb bottles.

"Alysine" ®

MERRELL 1828

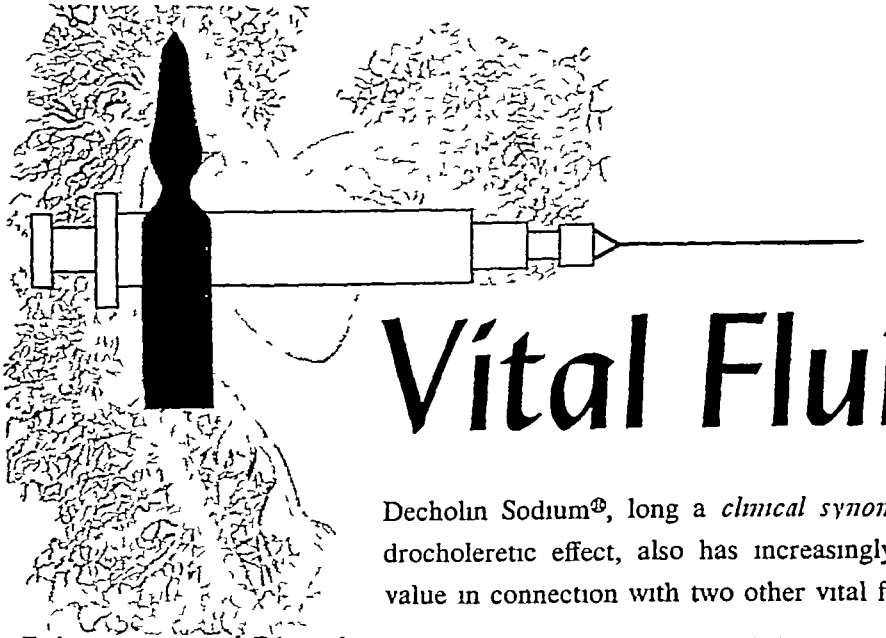
The Wm S Merrell Company • Cincinnati, U S A.

In a recent coast to coast test of hundreds of people who smoked only Camels for 30 days, throat specialists, after weekly examinations, reported:

"Not one single case of throat irritation due to smoking CAMELS!"

Hundreds of men and women were included in this coast to coast test These men and women smoked Camels—and only Camels —for 30 consecutive days They smoked on the average *of one to two packages a day* Each week noted throat specialists examined the throats of these Camel *smokers*—a total of 2470 careful examinations In every report, the findings of these throat specialists were the same—"not one single case of throat irritation due to smoking Camels"

According to a Nationwide survey:



MORE DOCTORS SMOKE CAMELS

than any other cigarette

Doctors smoke for pleasure too! And when three leading independent research organizations asked 113,597 doctors what cigarette they smoked the brand named most was Camel.

CAMEL
TURKISH & DOMESTIC BLEND CIGARETTES
Money-Back Guarantee!
Test Camel Mildness for yourself in your own "T Zone"—T for taste T for throat If, at any time, you are not convinced that Camels are the mildest cigarette you ever smoked, return the package with the unused Camels and we will refund its full purchase price, plus postage (Signed) R J Reynolds Tobacco Company, Winston Salem, North Carolina

Vital Fluids

Decholin Sodium®, long a *clinical synonym* for hydrocholeretic effect, also has increasingly-recognized value in connection with two other vital fluids

Enhancement of Diuresis In cardiac decompensation with hepatic engorgement, Decholin Sodium given alone produces mild diuresis More often it is administered simultaneously with mercurial diuretics to potentiate their action and reduce their dose

Blood Circulation Time Arm-to-tongue blood circulation time is reliably and relatively safely determined by injection of Decholin Sodium into a cubital vein If desired, an arm-to-lung time test is readily included in the procedure by adding ether to the Decholin Sodium injection

Decholin Sodium

sodium dehydrocholate

supplied in 20% aqueous solution for intravenous administration Available now in ampuls of 3 cc , 5 cc. and 10 cc , boxes of 3 and 20 ampuls

The booklets, Decholin Sodium in Blood Velocity Determination' and "The Diuretic Action of Decholin Sodium' are now available—and will be sent upon your request.

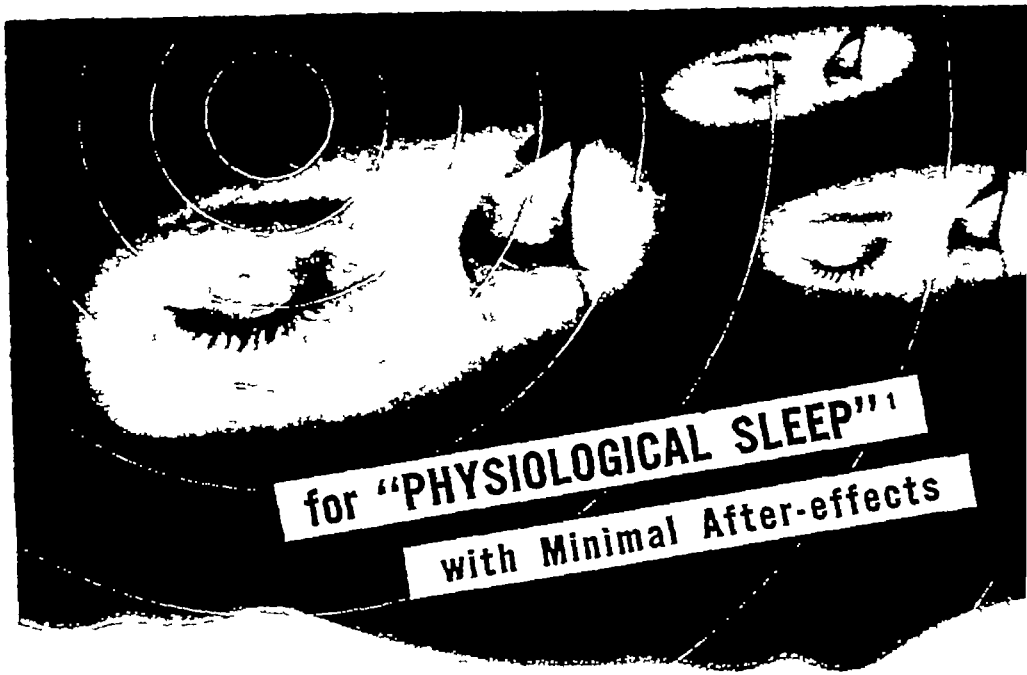
2. PARASYMPATHETIC INHIBITION with Bellafoline.
3. CENTRAL SEDATION with phenobarbital

SANDOZ

Originality • Elegance • Perfection

FOR FUNCTIONAL DISORDERS



Patients with psychosomatic disorders suffer somatic distress just as much as those with organic disease

For these patients **Bellergal** provides an effective combination of drugs acting on both divisions of the autonomic nervous system as well as on the central nervous system

Use **Bellergal** *in the treatment of* gastrointestinal neuroses and other functional disorders

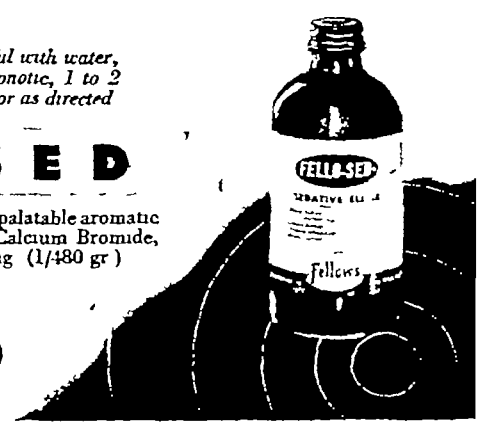
Bellergal®

SANDOZ PHARMACEUTICALS
Division of **SANDOZ CHEMICAL WORKS, INC.**
68 72 CHARLTON STREET, NEW YORK 14, N Y

Chloral hydrate, used in medicine since 1869, is, even today, "the standard hypnotic of its class"[1]

Goodman and Gilman observe that it "is unfortunately neglected today," and that the present widespread use of the barbiturates has " caused the physician to lose sight of the fact that chloral hydrate is still one of the cheapest and most effective hypnotics"[2]

In FELLO-SED, supplementation with calcium bromide and atropine sulfate largely overcomes unwanted side actions, enhances the sedative effect and provides valuable antispasmodic activity It is presented in palatable liquid form



[1]N.N.R., 1947 p. 398.
[2]Goodman, L. & Gilman, A., The Pharmacological Basis of Therapeutics MacMillan, 1944, pp. 177-8.

Available in 8 fluidounce bottles

Adult Dose. As a sedative. ½ to 1 teaspoonful with water, every 3 or 4 hours or as directed As a hypnotic, 1 to 2 teaspoonfuls or more with water at bedtime, or as directed

FELLO-SED

FORMULA Each fluidram (4 cc.) contains, in a palatable aromatic vehicle Chloral Hydrate, 0 5 Gm (7½ gr), Calcium Bromide, 0.5 Gm (7½ gr) Atropine Sulfate, 0 125 mg (1/480 gr)

LEG ULCERS

the DAXALAN-DOME-PASTE BANDAGE TECHNIQUE

AS INTRODUCED BY DR WILLIAM M. COOPER Director Department of Peripheral Vascular Diseases—New York Polyclinic Medical School and Hospital

This technique is based on a 3 point program—

1. Reduction of dermatitis with wet dressings of DOMEBORO TABS *(BUROW S SOLUTION)*
2. Combat local infection and stimulate healing with thick application of DAXALAN in the center of the ulcer and surrounding areas.
3. Overcome venous insufficiency stasis and edema by wrapping DOME PASTE BANDAGE around the entire leg to supply compression

DOCTOR! You may now prescribe SOOTHING Modernized Simplified Fresh and Stable BUROW S SOLUTION 1 20 in four forms DOMEBORO Tablets Packets Powder Ointment

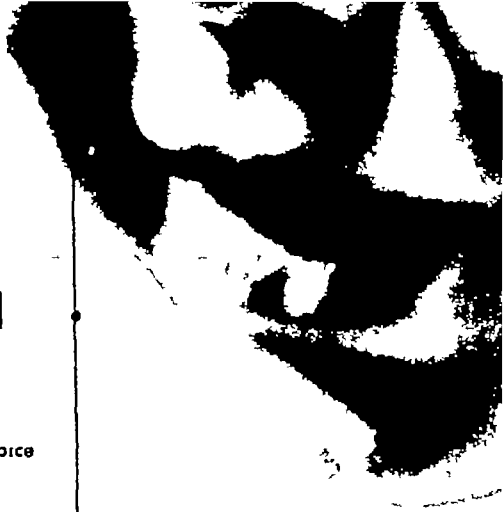
Representing Choline Dihydrogen Citrate 25% W/V

Only within the present decade has choline assumed its important position as a vital part of the dietary treatment of hepatic dysfunction

Palatable Syrup Choline Dihydrogen Citrate (Flint) may be used as a supplement to other therapeutic measures in the treatment of chronic liver involvement in diabetes, in malnutrition, in poisoning by hepatoxic agents, in various infectious processes and in cirrhosis

"Syrup Choline (Flint)" containing 1 gram Choline Dihydrogen Citrate in each 4 cc is supplied in pint and gallon bottles



A COUNCIL-ACCEPTED CHOLINE PRODUCT

spasmolysis

spoonfed

For your discriminating choice of a *spasmolytic agent*, these striking characteristics of Robins' Donnatal Elixir are particularly noteworthy

- It's a superior spasmolytic in the most varied manifestations of visceral vagotonia—it suits the youngest oldest or the most finicky "taste"
- It provides the principal *natural* belladonna alkaloids in unvarying optimal ratios—is compatible with many adjuvant medications
- It comprehensively combines peripheral and central sedation—for cases of either somatogenic or psychogenic etiology
- It's potent spasmolysis **spoonfed!**

Each 5cc of Donnatal Elixir contains.

Hyoscyamine Sulfate	0 1037 mg
Atropine Sulfate	0.0194 mg
Hyoscine Hydrobromide	0.0065 mg
Phenobarbital (¼ gr.)	16.2 mg

a new and outstanding development in penicillin therapy

PENICILLIN S-R

Parke-Davis

COMBINED SOLUBLE AND REPOSITORY PENICILLIN

higher initial levels

A 1-cc. intramuscular injection produces serum levels of 4.0 units per cc.—a value 133 times higher than the commonly accepted therapeutic level 0.03 units per cc.

quicker maximal therapeutic levels

Within a half hour or less after the injection a high concentration of penicillin is found in the tissues.

prolonged high maintenance levels

For twenty four hours or longer a single injection continues to provide effective therapeutic levels.

better control of infection

Rapid onset and prolonged maintenance of higher levels means more effective antibacterial action than possible with penicillin in retardant vehicles.

extra margin of effectiveness

Higher levels quickly obtained permit early dominance over infecting organisms and diminish likelihood of penicillin fastness.

ease of flow

Penicillin S-R contains no oil, no wax, no added suspending or dispersing agents to impede injection or clog needle and syringe.

additional advantages of **PENICILLIN S-R**

PREPARATION	ADMINISTRATION	CONVENIENCE	TOLERANCE
Easily and quickly prepared	Free-flowing	Syringe and needle need not be dry	No sensitizing diluents
Aqueous diluent	Quickly injected	No plugging of needles (20 or 21 gage)	No added suspending agents
No vigorous shaking	No special-type syringe	Syringe and needles easily cleaned	Completely absorbed
			Minimal pain

PENICILLIN S-R is supplied in both one-dose (400,000 units) and five-dose rubber-diaphragm-capped vials. When diluted according to directions (with Water for Injection, U.S.P., Normal Saline Solution, U.S.P., or 5 per cent Dextrose Injection, U.S.P.) each cc. contains 200,000 units of crystalline procaine penicillin-G and 100,000 units of buffered crystalline sodium penicillin-G. The one-dose vial is also available with an accompanying ampoule of Water for Injection, U.S.P., if desired. Potency of the suspension is maintained for seven days at refrigerator temperatures.

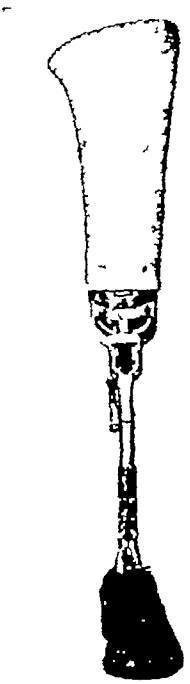
Guaicol 0.60 Beechwood Creosote 1.302 Sol. Formaldehyde 0.60 Aluminum Silicate 46.44
Methyl Salicylate 0.60 Glycerine C. P 51.0.0 Carmine 0.30

Dear Doctor.



For the benefit of amputee patients we would like to show you the new Natural Action Limb which is all that the name implies

With single column shin structure, new improvements have been developed including cosmetic cover

The safe knee action and self-aligning feature made possible by the universal ankle motion make the owner forget the major difficulties and cares which haunt most wearers who fear knee-buckling and unsteadiness.

The automatic toe-lift and synchronization of knee and ankle motion allows the wearer to step normally without awkward swaying or hiking of the body He experiences the thrill of complete confidence and effortless control that s beyond anything in normal limb wearing experience. Many wearers speak of commendatory remarks they have received on the improvement accomplished after being fitted with a Natural Action Limb

But how did this come about? Through research by George A. Hinkle who wore the conventional type of limb for 27 years He realized that a radical change was necessary in design and function to do the trick of making amputees walk better and enjoy a more natural-acting appliance We've arrived at the correct principles for accomplishing this and would like to have you see the new design in actual use May we send you more complete information or have an appointment to demonstrate?

A T Weger,
General Manager

In acute respiratory infections control of the distressing discomfort

Dasin

In Colds

Alleviation of the many distressing symptoms associated with even minor upper respiratory infections is promptly obtained by Dasin. Presenting Dover's powder (½ gr.), aspirin (2 gr.), acetophenetidin (1½ gr.), camphor (¼ gr.), caffeine (⅛ gr.) and atropine sulfate (1/500 gr.), Dasin provides the analgesic, antipyretic and diaphoretic actions required for quick relief. Excess nasal and bronchial secretions are reduced. Average dose, 1 or 2 capsules every 2 or 3 hours.

Sedacof and Codeine

For Coughs

When annoying cough complicates the respiratory infection, Sedacof and Codeine is indicated. Presenting per fluidounce codeine phosphate (1 gr.), sodium citrate (16 gr.), ammonium chloride (2 gr.), ephedrine hydrochloride (1 gr.), antimony and potassium tartrate (1/16 gr.), pilocarpine hydrochloride (1/20 gr.), and aromatics (q.s.), Syrup Sedacof and Codeine acts as a secretolytic agent, promotes ciliary function important for removal of secretions, and affords needed sedation for suppressing the cough reflex.

Sedacof and Codeine, a palatable syrup, is indicated in the cough of the common cold, in laryngotracheobronchial irritation, influenza, and the hacking cough of the aged. Average adult dose 1 to 2 teaspoonfuls 2 to 4 times daily. Children according to age

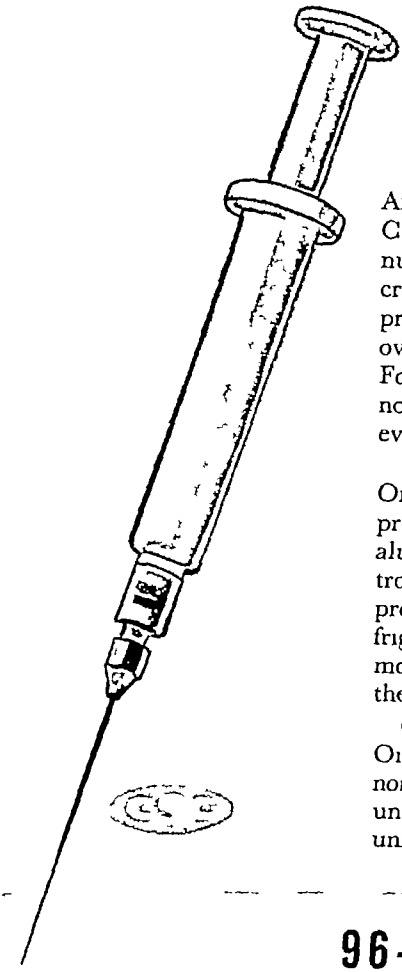
PIONEERS in Research . . . and Leadership thru the years in combating OTITIS MEDIA

DOHO in realizing the need for a potent, topical, well tolerated ear medication, yet mindful that no one formula could be suitable for all conditions devoted every facility and scientific resource to the development and perfection of AURALGAN and OTOSMO-SAN Each has its sphere of usefulness each has been tested and clinically proven in many thousands of cases *Reprints and substantiating data sent on request*

EACH A SPECIFIC . . . both effective!

Auralgan
IN ACUTE OTITIS MEDIA

is a scientifically prepared, completely water free Glycerol (DOHO) having the highest specific gravity obtainable, containing antipyrine and benzocaine which by its potent decongestant, dehydrating and analgesic action provides effective relief of pain and inflammation



O-TOS-MO-SAN
IN CHRONIC SUPPURATIVE OTITIS MEDIA FURUNCULOSIS AND AURAL DERMATITIS

is not just a mere mixture, but a scientifically potent chemical combination of Sulfathiazole and Urea in AURALGAN Glycerol (DOHO) base which exerts a powerful solvent action on protein matter, liquefies and dissolves exuberant granulation tissue, cleanses and deodorizes, and tends to exhilarate normal tissue healing in the effective control of chronic suppurative otitis media.

PARALLELING THE PITUITARY

The placenta produces a hormone whose clinical action almost parallels that of the luteinizing hormone of the pituitary gland This hormone, known as chorionic gonadotropin, is excreted in the urine in appreciable quantities after the third month of pregnancy It is a true gonad stimulating substance and thus has important therapeutic applications in both the male and female where luteinizing hormone therapy is indicated. In the male it has proven of great value in cryptorchidism, and it has been used successfully in treating simple hypogonadism and hypogenitalism In the female it has been effectively employed in the treatment of functional uterine bleeding as well as in secondary amenorrhea, oligomenorrhea and hypo-ovarianism Detailed literature will be sent gladly to physicians upon request.

Have confidence in the preparation you prescribe — specify

Why Many Physicians Write It

CARSTAIRS

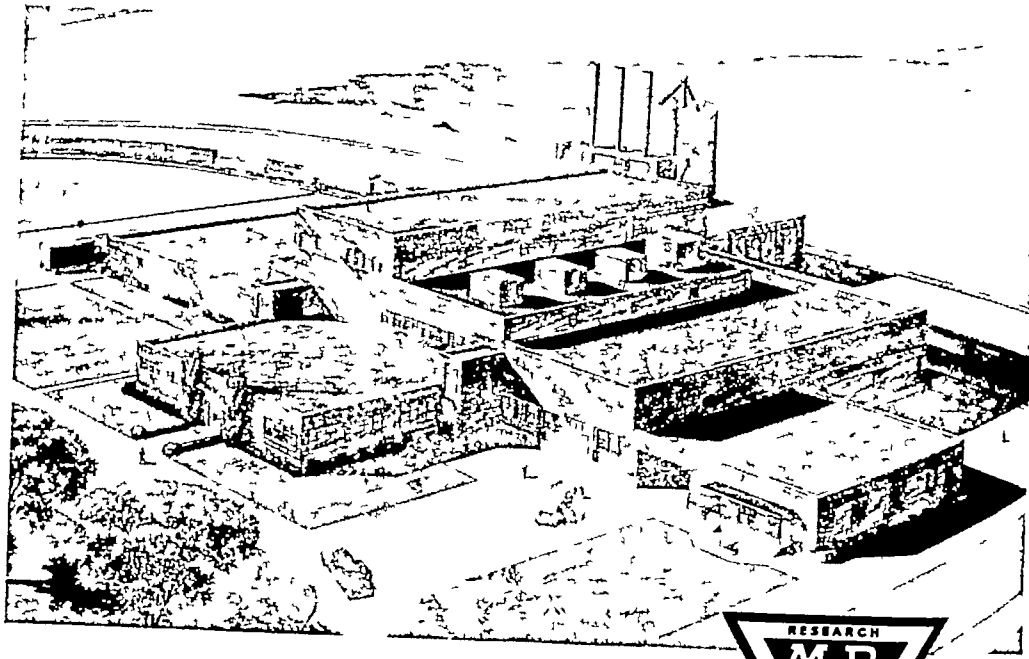
when whiskey is indicated

MORE and more well informed physicians are recommending light blended whiskey to their patients when whiskey is medically indicated Reason

Neutral spirit blends contain few congeners, such as fusel oil, tannins, aldehydes, esters, furfurals, acids, etc That means they're not only light but mild, too What's more, they're usually around only 86 proof • (43% alcohol by volume)

One of America's leading whiskies of this type is Carstairs White Seal It is blended with care by expert distillers devoted to the highest quality standards Their insistence on perfection has made Carstairs famous as the Perfectly Balanced Blend

Whenever whiskey is indicated, may we suggest that you recommend that superb blend—Carstairs White Seal—to the patients in *your* care?



The Medical Man who Cares says

Findings from the Saratoga Spa records*

INHALATIONS

The results obtained in the treatment of 738 patients with inhalation at the New York State-owned Saratoga Spa show interesting tendencies

Marked relief of the condition treated was noted in 38 patients (5 2%), moderate relief in 468 patients (63 4%), temporary relief in 46 (6 4%), and no change in 185 (25%)

Conditions for which the treatments were given included sinusitis, coryza, bronchitis, chronic rhinitis, bronchial asthma, laryngitis, allergic rhinitis, hay fever, and pharyngitis The treatments consisted of the inhalation of finely nebulized saline-alkaline, naturally carbonated mineral waters, and medicated oils

The relief obtained bore a definite relation to the number of treatments taken In acute conditions, from four to six treatments were necessary to obtain consistent improvement while in chronic conditions, twelve to fifteen treatments were usually required

Inhalations are taken without discomfort, which is an important factor in therapy

The safety of the therapy can be stressed Reactions of significance occurred in only three patients One patient may possibly have had a sensitivity to chlorenan, one developed an acute asthmatic paroxysm, and the third noted a general reaction to epinephrine

Attention to the general condition of the patients suffering from respiratory disorders is an important factor Inhalations have a definite place in the general "cure" regimen of a spa

*As printed in the New York State Journal of Medicine, 44.1214 (June 1) 1944.

The SARATOGA SPA

"Physician, Give Heed to Thine Own Health"

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here After a restorative "cure" at the Spa, you, too, will return to your practice refreshed—revitalized—ready for the busy days that lie ahead.

For professional publications of the Spa, and physician's sample carton of bottled waters with their analyses, write W S McClellan, M D., Medical Director, Saratoga Spa, 155 Saratoga Springs, New York.

Conti

PRESENTS THE PERFECT *Olive Oil* TRIO FOR BABY'S SKIN

NEW CONTI BABY OIL—With Olive Oil

The lighter quality of this oil makes for easier spreading and consequently a saving of the nurse's and mother's time A pure, specially refined olive oil, scientifically combined with lanolin and light mineral oil, made to the same high standards which have made the name of CONTI famous for nearly a century No antiseptic—No danger of allergy Attractive, non-skid 6-oz bottle

NEW CONTI BABY POWDER—With Olive Oil

A fluffy, olive oil powder, skin-smooth, of extra-finely textured white talc, delicately scented and special spray-treated with refined olive oil Handsome 10 oz. container

These two products combined with the CONTI CASTILE SOAP which has been medically approved for babies for years constitute a new perfect trio of pediatric aids

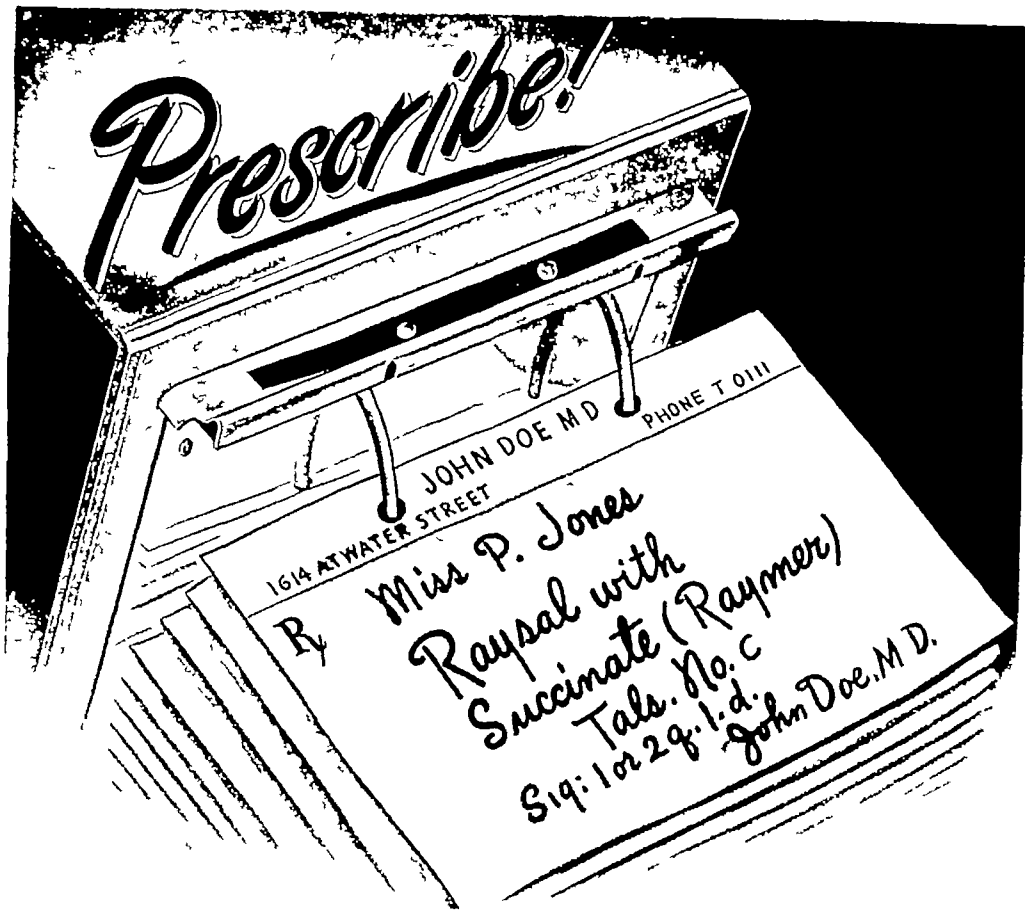
Glytheonate

(P A T C H)

ND OF THEOPHYLLINE SODIUM GLYCINATE

For Intensive and Prolonged Oral Theophylline Therapy

Minimal gastric irritation as shown by Paul[1] and Bubert[2] permits high dosage levels and prolonged oral use Glytheonate is a combination f theophylline and sodium glycinate represent- 50% theophylline U.S P It is available in tablets and suppositories (rectal)



Note how the muscle fibers run around the bronchioles Note how contraction of these muscles constricts the bronchioles One beneficial effect of theophylline compounds is attributed to their antispasmodic action directly on the bronchial muscles, relaxing the spastic contraction, with a subsequent dilation of the bronchial tree and a flow of more air into inner recesses of lungs

Glytheonate is used

- To treat bronchial asthma and Cheyne-Stokes respiration.
- To relieve paroxysmal dyspnea of pulmonary edema and paroxysmal attacks of cardiac dyspnea
- As a diuretic in congestive heart failure
- Like other xanthines, it stimulates the myocardium to increased vigor of contraction

Orapen-250

It is now possible to give 250 000 units of crystalline penicillin G (potassium salt) in one coated, pleasant tasting buffered tablet, if you specify the Schenley product. Ample evidence supports the value of the oral administration of penicillin when given in sufficiently high dosage. Clinical reports show that even serious infections due to penicillin sensitive organisms—such as acute respiratory illness [1,2,3,4] impetigo,[4] gonorrhea [5] and rheumatic fever (prophylaxis)[6]—can be treated effectively by this convenient, painless method of administration.

ORAPEN IS UNIQUE
A special coating completely masks the taste of penicillin. ORAPEN is stable at ordinary room temperatures, eliminating necessity for refrigeration.

The Health of the American People

The health of the American people is the concern of the people themselves through their government—their elected representatives, and of physicians who by reason of their skills, technics, and scientific alertness now lead the world

The issue of the best method of bringing those attainments of American physicians to all the people is precipitated by the new administration's advocacy of a program of compulsory health insurance Mr Oscar R. Ewing, F S A. head, is presently carrying the ball for the government

The American Medical Association, representing the majority of the country's doctors has announced a campaign of public information to put before the people the facts relating to its advocacy of voluntary prepaid health insurance To do this, the Association is assessing its members $25 a head, little enough, we think, considering the importance of the public health problems involved

Mr Ewing spoke recently in New York City about the government's proposed compulsory health insurance plan According to the *Daily News*, in its edit Smear the Doctors," Mr Ewi in creating a doubt of the va plan [1] Says the *Daily News*, in

> At this stage of the medical feel more against Mr Ewing tha
>
> One big reason why we're so Ewing manner of opening the can suade Congress to adopt his heal
>
> In a recent speech in New York Mr Ewing, instead of explain calmly, saw fit to cut loose with a of the leaders of the American ciation. These gentlemen intend nation's doctors $25 a head in or $3,500,000 fund with which to fig proposals
>
> They have a perfect right to d as we can see, only provided they laws on registering lobbyists in If the doctors haven't such a right have the big labor organizations a money to push their chiefs' ideas, build big kitties to peddle prol don't hear any protests from a circles about these labor and dry

[1] Daily News (Dec. 20) 1948, p 33

To Mr Ewing, however, the doctors' defense chest is a slush fund "to finance the greatest lobby in history for a last-ditch stand," and the doctors collecting the money are "the reactionary elements of the medical profession" Also, "the hour of these gentlemen is past," and they feel "the inevitable breathing hard on their necks"

That is smear language, name-calling, an effort to line up public opinion against the opponent before he has had a chance to open his mouth in his own behalf

It is not fair play We think it is bad tactics We feel sure it cannot contribute to an intelligent solution of the problem of extending adequate medical care to the whole U S population

There is no argument on the fact that many Americans now do not get such care, either because they can't pay for it or because there are not enough doctors Plenty of others, too, depend on rabbits' feet or quacks or witches for their medical help, and plenty more are afraid to consult doctors to find out what ails them, for fear the news will scare them to death

It seems to us that the socialized medicine debate will be much more intelligent and constructive if those on both sides will contribute light instead of heat Mr Ewing's output up to now has been chiefly heat

We'd like some hardpan, factual information, for instance, on such questions as these

If, under the proposed system, a patient can choose his own doctor, what happens when some popular physician is swamped with customers and an unpopular one in the same community finds time hanging heavy on his hands?

How are hypochondriacs (people who think they're sick most of the time but aren't) to be kept from overloading the setup? Same as to chiselers, malingerers, and people who would just love to move into hospitals for good long rests if the government would pay the bills Suppose doctors here and there sabotage the plan, by prescribing unnecessary and expensive medicines, or unneeded spectacles, false teeth, trusses, etc ?

These and many other surprises are cropping up in England, where the Labor Government has recently installed a state medicine system Costs are ballooning above original estimates, while Health Minister Aneurin Bevan screams alibis and oaths

It would be helpful, we feel, if Mr Ewing and his compulsory health insurance friends would let the public know, in plain English, what if any precautions are taken in their plans against some sad and very costly repetitions of the British mishaps

After all, this public health problem is a serious one, and the main object is to get it solved correctly the first time Smearing the American medical profession—which incidentally leads the world in skill, technics and scientific alertness—can hardly help toward that end

The American sense of fair play and the recognition voiced by the *Daily News* of the seriousness of the public health problem, we feel, will become more in evidence as time goes on Facts are badly needed, we agree To this end the American Medical Association's program of public education will be built around three objectives

1 To awaken the people to the danger of a politically controlled compulsory health insurance system

2 To acquaint the people with the superior advantages of American medicine over the government-dominated systems of other countries

3 To stimulate the growth of voluntary health insurance systems and prepaid medical care plans to take the economic shock out of illness and increase the availability of medical care to the American people

There are facts to support all three of the above objectives, and we may assure the *Daily News* and all others that those facts will constitute the foundation of the A M A 's educational campaign On that foundation of fact will be built a body of informed opinion free of political "gobbledegook," available to the public through the monetary contributions of the majority of the doctors of the country whose sole aim is to improve by the best means possible the health of the American people They have pursued this goal consistently and will never abandon it Who else but the doctors have created the public health?

Note the dates for the 143rd Annual Meeting of the Medical Society of the State of New York—May 2–6, 1949, Hotel Statler, Buffalo

The President's Page

The medical profession, called by Robert Louis Stevenson "the flower of our civilization," is now on trial Grave decisions will soon be made, which will determine whether our methods of service, our ideals, our independence will endure

We are not opposed to change In fact, we will work continually for change if it is for the benefit of our patients, and if, in the end, that change leaves our individual patient an individual, not a number The physician is only part of the social picture, and it is certain that the profession will not completely control its own destiny in the economic sphere Its spiritual destiny, however, will be its own to preserve gloriously, or to lose miserably

Opposing us are large groups of people of various sorts Sociologists, labor organizations, government bureaucrats, and even minority groups in the profession itself are doing their utmost to shackle the physician in a system of government-controlled distribution of medical care

The issue, as expressed by all of these groups, is for the most part an economic one, and is based on the false idea that money can cure the evils that beset mankind If we add our war debt, the material price of our liberty to date, we are now spending and giving away our great-grandchildren's money, with dogged perseverance, to prove this thesis, but I leave it to you whether the evils seem to be diminishing or multiplying

The physician, on the other hand, points out that the most important thing is a high standard of medical service to the people So both sides are not talking about the same thing at any time

The medical profession is keenly aware of the high cost of medical care No one is more so Medical fees are but a fraction of it It is indeed a very complicated problem The medical profession will accept whatever is for the good of its patients, provided the control of and responsibility for their care is left with the doctors—where it belongs

The medical profession will fight this threat to its patients best welfare with all its strength, and with honor and integrity Our hope is that the people themselves, as this controversy is waged, will distinguish between sound and sound judgment

The long-range program of the government should be to empty the beds of hospitals now existing, rather than to pile hospital on hospital Public health centers widely distributed throughout the United States and intense research to eliminate the diseases that now fill the beds would be steps in the right direction A campaign of Scottish thrift in the government also might become contagious throughout the land, and might eventually prevent us from becoming a nation of querulous mendicants

The true physician, actuated by his ideals, will ever carry on in fair weather or foul He would rather carry on as at present, with the ever-increasing potentialities for good for his patient If, however, he must bow to the whirlwind, his wounds will be on his front and not on his rear, and he will still carry on If a debacle should come, he will again assume control and carry on It will be his duty to do so He knows no other stimulus It is in his blood

The people should not be anxious about their doctors They should be anxious for themselves If medicine should be socialized, that will be here, as it has been elsewhere, the entering wedge to the collective state—the great leveler If this nemesis should catch up with our generation, it will sit down with our children and our children's children

Howard A Rusk, M D , Director

Rehabilitation in Multiple Sclerosis

Because of the hopeless outlook in multiple sclerosis, therapy in general has been directed toward symptomatic relief, and the approach has been a negative one In rehabilitation, the disability, rather than the specific disease process which has produced it, is our primary consideration In multiple sclerosis, as in any other chronic, progressive, crippling disease, the problems are the same In considering a patient as to feasibility for training, progression of the disease must be carefully evaluated, for if the disease process outstrips training, such training is obviously wasted

In rehabilitation, the primary consideration, in working out a program for the severely disabled, is to teach him to live, and if possible to work, with what he has left Those capacities can be determined only through performance testing In addition to general diagnostic studies, the medical evaluation of the multiple sclerosis patient must include muscle tests, joint range of motion, and tests for the inherent needs of daily living These are of primary importance, for it is upon their results that the patient's rehabilitation program is planned

Too frequently, in rehabilitation, many of the basic skills necessary for effective daily living are overlooked The patient is given numerous medical, psychologic and vocational services in preparation for employment, but retraining in the basic physical skills of ambulation, elevation and self-care activities is neglected, with the result that the patient, being unable to walk, travel, or care for his personal needs, is also unable effectively to utilize the other medical, psychologic, social, and vocational services he has received for richer and fuller living

It has been found difficult in many instances to differentiate between muscular inability due to disease and that due to atrophy of disuse, and sometimes only a test period of conditioning exercise will provide this information, which is vital in the training program

From the information gained by the tests for the factors of daily living, a suitable program is set up for the individual, designed to meet his particular needs It has been noted, especially in hand activities and gait training, that individuals long incapacitated from multiple sclerosis will have alienation and overcompensation of certain muscle groups With muscle re-education and definitive therapeutic exercise, it is often possible to accomplish much in correcting these conditions

We approach the psychiatric-psychologic problem as a team—the psychiatrist, the social worker and the psychologist—working with the family as well as with the patient

It has been found that the previous personality of multiple sclerosis does not conform to any particular pattern There is immaturity in certain cases, and a great deal of independence and relative maturity in other cases

The main point is that, after the patient's personality is thoroughly known by psychiatric examination, psychologic study and social service investigation, then each problem, as it comes up, can be handled with the full knowledge of the limitations of the patient, psychologically and physically

Multiple sclerosis offers one of the most challenging problems in the entire field of rehabilitation, both from the physical and the psychologic standpoint Therapy in this field requires patient training and deep understanding However, the results in the restoration of confidence and function, although far from satisfactory, have been gratifying

Presented at a meeting of the Association for Research in Nervous and Mental Disease December 11 1948.

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Parenteral Nutrition, I

The reduction in surgical mortality, at a time when surgeons were undertaking an extensive and prolonged attack on pathologic conditions formerly considered inoperable, has been one of the outstanding achievements of medicine during the past decade Advances, too, have been made in internal medicine, some being the direct result of a better understanding of the metabolic needs of the human organism In surgery, practical application of this understanding must begin before the patient goes to the operating room Antibiotics, better anesthesia, and improved technical skill have assisted in bringing about a reduction in operative deaths None of these beneficial factors function, however, if the patient's fate is already determined by incorrect preoperative treatment Likewise, in medicine, a patient may cross a nutritional threshold over which he cannot return because some processes are not reversible Many complications of surgery, such as failure of wounds and anastomoses to heal, sepsis poor response to anesthesia, and operative trauma, are now known to be related to preoperative protein privation Surgeons have reduced surgical mortality by concerning themselves with phases of the patient's care in addition to good operative technic The internist, too, has welcomed the advantages of parenteral alimentation He, as well as the surgeon, deals with patients whose gastrointestinal systems malfunction for various lengths of time It is the purpose here to review briefly the historical development of the various components of parenteral alimentation, including blood which always is food for the recipient, regardless of other medical indications for transfusion

In subsequent issues, symptoms and signs of nutritional deprivation will be discussed Finally, the various nutrient components of the parenteral diet will be delineated, and their interrelationships clarified

Soon after Harvey's discovery of the circulation in 1628, physicians began to think of introducing substances into the body by way of the veins Wren, in 1657, is reported by Keynes to have been the first physician to inject medicinal agents into the veins of animals [1] Wren's reports stimulated Lower to try transfusion of blood from dog to dog Although Denys in 1667 successfully transfused a boy with lamb's blood, for the remainder of the seventeenth century transfusions of animals' blood to man met with frequent failure, and finally legislation was introduced in England to prohibit the practice Early in the nineteenth century (1818) Blundell gave the first transfusions from man to man [2] Six out of ten of these transfusions were failures Undoubtedly, ignorance of the different groups of human blood was responsible for these failures Following the classification of the blood groups in man by Landsteiner in 1901, interest was again aroused in transfusions for blood loss replacement [3] After the discovery by Lewisohn in 1915 of a practical and efficient way to avoid coagulation of the blood by the use of sodium citrate, transfusion technic for the indirect method gradually replaced the direct donor-recipient method [4] Blood banks of today are built upon the work of Landsteiner and Lewisohn

To Thomas Lotta of Leith, Scotland, goes the credit for first using the intravenous route to replace water and salts to the body His account of clinical improvement in patients severely dehydrated from cholera who received intravenous salt and water, and the reports of O'Shaughnessy's chemical analysis of the blood of patients who received this treatment indicate a comprehensive understanding of the electrolyte and water requirements of the body [6] Although the method was used throughout the nineteenth century, contamination by pyrogen was common, and the solutions were not iso

tonic Reactions were, therefore, common, and clinical improvement did not always follow the infusion if isotonic solutions were required for improvement Not until Van Slyke clarified the complex problem of acid-base balance did the intravenous method for replacing water and electrolytes become the accepted method for combating dehydration with its concomitant acidosis or alkalosis [7]

The first injection of carbohydrate into veins was made by Claude Bernard [8] He recorded that cane sugar when injected into the vein soon appeared in the urine, but if it had previously been acted upon by gastric juice (converted to glucose), it disappeared and apparently was utilized In 1896 Biedl and Kraus showed that a 10 per cent solution of glucose disappears following intravenous injection without the appearance of glycosuria or polyuria [9] It remained for Woodyatt and his associates in 1915, however, to demonstrate man's capacity for metabolizing intravenous carbohydrate and to point out the dangers of excessively large doses of hypertonic glucose [10] In 1942 Stewart and Rourke stressed the importance of differentiating between the effect of glucose in water and the effect of glucose in saline [11] Rightly, they called attention to the fact that the former combination was dehydrating, while the latter when introduced intravenously resulted in water retention

Austin and Eisenhey in 1912 suggested that dogs could utilize dog and horse serum administered intravenously as a source of tissue nitrogen [12] It remained for Holman and associates in 1934 to demonstrate that positive nitrogen balance in dogs could be obtained by using homologous plasma intravenously as the sole source of protein intake [13] Similarly, Wangensteen and associates demonstrated that man could be maintained in positive nitrogen balance by administering human plasma intravenously as the only source of nitrogen intake [14] It is now known that plasma protein given intravenously soon disappears from the circulation and apparently becomes a part of general body protein stores [15 16] In 1939 Elman and Weiner reported the use of an acid hydrolysate of casein with added tryptophane and cystine for intravenous alimentation, and they reported positive nitrogen balance with its use [17] Many nutritional studies since 1939 have centered attention on the fact that positive nitrogen balance can be maintained in man by parenteral use of an enzymatic casein digest [18 19]

Fat, as a nutrient having calorie value, has not kept pace with preparations of protein and carbohydrate for parenteral use Curiously enough, fat was the first food stuff to be injected parenterally Menzel and Perco injected various types of oil into the subcutaneous tissues of dogs and found that the site of injection showed almost complete absorption of the fat in twenty-four to forty-eight hours [20] Koehne and Mendel have shown that, although fat is absorbed from local sites of injection, there is little utilization of it by the body [21] Fat emulsions for intravenous use have been extensively studied over the past quarter century Nevertheless, a general employment of this method of parenteral alimentation has not been forthcoming Recently, however, a fat component has been developed for parenteral use which appears to have promise [22] Mann *et al* report that their emulsion No 35 is utilized by growing puppies without chemical or histologic trace of fat retention when given them intravenously in amounts not exceeding 30 per cent of their caloric requirement [23]

CHILD HEALTH SERVICES IN NEW YORK STATE

GEORGE M WHEATLEY, M D , New York City

(From the Metropolitan Life Insurance Company)

THIS is a partial report of the study conducted in New York State in 1946 and 1947 by the American Academy of Pediatrics in cooperation with the Medical Society of the State of New York, the State Health Department, organized dentistry, hospitals, and other health agencies to determine the amount and availability of health services for children * The survey was part of a nation-wide project undertaken by the American Academy of Pediatrics to determine the volume of existing preventive and curative services for children as a basis for the medical profession to make recommendations for improving and expanding these services The investigation embraced not only private medical and dental practice but hospital facilities and public health services, including those provided by voluntary agencies for children This paper is concerned with services rendered to children by general practitioners, pediatricians, and other specialists, the comparative amount of service in various parts of the State and in the country as a whole, and certain major facts regarding physicians in the State The complete report will be published in a few months **

Method and Organization

The study depended, in the main, on questionnaires addressed to three chief sources (1) hospitals, (2) private practitioners of medicine and dentistry including their specialties, and (3) public and private health organizations providing health services to children The reliability of the data from private practitioners of medicine and dentistry was checked by a team of professional interviewers who visited a representative sample of physicians and dentists throughout the State

Since a fundamental part of the study was the information from private practitioners, the assistance of the State Medical and Dental Societies was indispensable The project has had not only the endorsement but the active participation of these organizations The work itself was under the immediate supervision of a committee of four pediatricians representing the American Academy of Pediatrics Drs Paul Beaven of Rochester, William Orr of Buffalo, and Frederick Wilke and Thurman Givan of New York City Twelve regions of the State were designated by the State Medical Society, each with a pediatrician to be responsible for the distribution of questionnaires and local interpretation of the study

The State Dental Society's Council on Dental Health, under the chairmanship of Dr Donald H Miller, Dr Franklin A Squires, Dr Waldo H Mork, and the late Dr Burkhart, gave us invaluable aid in securing the cooperation of practicing dentists

Not only was there an excellent response to our request for information by a large majority of physicians and dentists, but many official and voluntary health agencies have made the job easier by helping to obtain some of the data, providing office space, and many other aids The immediate responsibility for the work was carried by a full-time staff headed at first in Greater New York by Dr Theodore Allen, later succeeded by Mr John Peterson Dr Arthur Johnson, retired health officer of Rochester, directed the collection of data for the entire upstate area

Some appreciation of the magnitude of the survey task can be realized from the fact that, although New York is, in geographic area, only the twenty-ninth state, it holds one-tenth of the population of our whole country It has 14 per cent of all the hospital beds in the nation, a sixth of the physicians, a fifth of all the pediatricians, a sixth of all the dentists, and 8 per cent of all the children.

Number and Location of Pediatricians

The definition of a pediatrician for purposes of the study was "any physician who stated he was

* The study in this State was financed largely by the local chapters of the National Foundation for Infantile Paralysis and by a grant from the Association for the Aid of Crippled Children.

** Copies now available may be obtained from the author at 1 Madison Avenue New York 10 New York.

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Pediatrics May 20 1948.

a pediatrician" In the study year 1946 to 1947, the total number of pediatricians in the United States, by this definition, was 3,496 This was 3 per cent of the 116,795 physicians reported in private practice New York State leads all other states, having about twice as many pediatricians as the next highest state, California In relation to child population, New York stands first with 24 pediatricians per 100,000 children, Connecticut, 21, Rhode Island, Maryland-District of Columbia, and Massachusetts, 19, and California, 18 This distribution of pediatricians seems to be related to at least two factors (1) the concentration of population and (2) the income level or per capita income of the respective states In the country as a whole, 1,796 (51 per cent) of the pediatricians are diplomates of the National Board of Pediatrics New York State has 53 per cent of its pediatricians certified by the Board

For analysis of the data, the counties in the State were divided into three groups

Greater Metropolitan—those counties containing a city with a million population or more and those counties adjacent to it with a high population density This included New York City, Westchester, Rockland, Nassau, and Suffolk Counties

Lesser Metropolitan Area—those counties with a city of 50,000 or more but less than a million and adjacent counties with high population density

All Other Counties

The Lesser Metropolitan group of counties includes the cities of Albany, Utica, Syracuse, Rochester, Buffalo, and Binghamton

The map in Fig 1 shows the county groupings based on these definitions of population centers The number and location of pediatricians in the State is shown also on the map The shading on the map illustrates a unique demographic feature compared to most other states, namely, more than half of the Empire State's population is concentrated in a very small section at the tip end of the State, the Greater Metropolitan Area, which, because of its location, is a medical center for several adjacent states It is, in addition, a national and international medical center, attracting patients from distant parts

Location of Physicians in Private Practice

The map in Fig 2 gives the location by counties of physicians in private practice in the State At the time of the study, in the five counties comprising New York City there were 13,323 physicians in private practice out of a total of 19,756 in the State as of October, 1946 The shadings show the concentration of practicing physicians per 1,000 children in each county

Almost three fourths of the general practitioners are located in the Greater Metropolitan Area (New York City, Nassau, Suffolk, Westchester, *and Rockland Counties) In this region,* 82 per cent of all the State's pediatricians practice as do nearly 80 per cent of the other specialists By comparison, 61 per cent of the child population under fifteen years of age live in the Greater Metropolitan area (Table 1)

A comparatively high concentration of specialists is found in the upstate urban areas The explanation may be that important medical centers and medical schools are located in Albany, Syracuse, Rochester, and Buffalo As might be anticipated, there are the least number of specialists in the sparsely settled counties

Age and Sex in Relation to Site of Practice

According to our data, one in ten of the general practitioners in the entire State is sixty-five years or older As Table 2 shows, a disproportionate number of older physicians are outside the Greater Metropolitan Area The proportion is highest (17 per cent) in the least populated

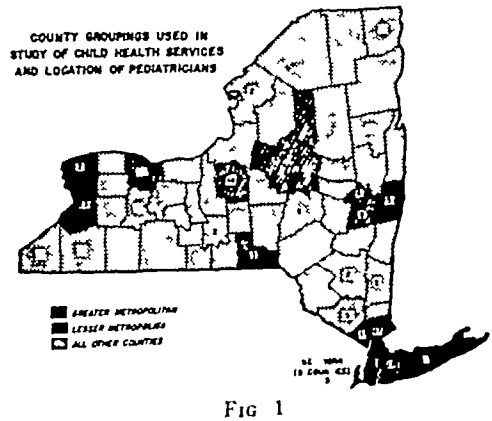

FIG 1

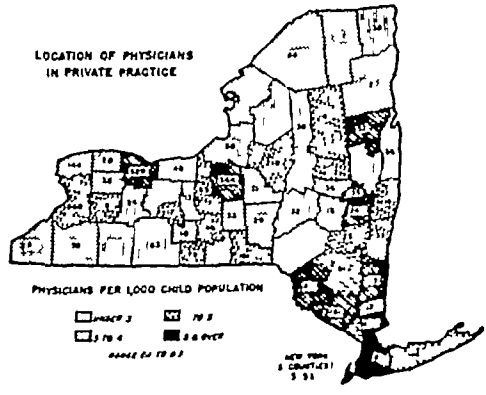

FIG 2

65 and over	10 6	8 9	13 4	17 1	3 3	8 8

* Percentages.

counties. Only about 3 per cent of the pediatricians are sixty-five years of age or older. This might be expected since pediatrics is a relatively young specialty. Almost 9 per cent of the other specialists in the State are sixty-five years of age or over.

Of the 1,094 women practicing medicine in New York State, 9 per cent specialize in pediatrics, while only 3 per cent of men practicing are in this specialty. Of the 677 pediatricians women constitute 14 per cent. We found that they tend to be concentrated in the Greater Metropolitan Area—81 of the 93 women who said they were practicing pediatricians are in the New York City area.

Availability of Private Medical Care

Figure 3 permits a comparison of the availability of the three categories of physicians—general practitioners, pediatricians, and other specialists—in the several county groups.

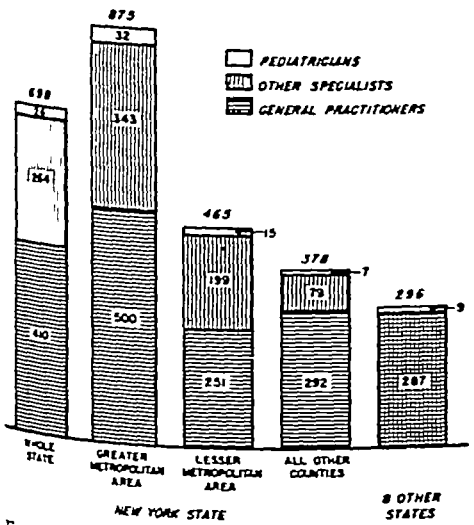

Fig. 3. Number of physicians per 100,000 children.

We have not tried to answer the question 'What is the optimum ratio of physicians to children?" New York State, even in rural areas, is better supplied with practicing physicians than the ratio of 296 per 100 000 for a sample group of eight states.*

TABLE 3.—Pediatricians Per 100 000 Children

New York State	24
Total United States	10
New York State—County Group	
Greater New York area	32
Upstate urban centers	15
All other counties	7

It is evident from Table 3 that New York State is well supplied with pediatricians. The Empire State has about 2½ times more pediatricians per 100,000 children than the United States as a whole. When we study the distribution of pediatricians by county groupings, we see once more the relatively higher concentration of pediatricians in the Greater New York City Area. Even the rural areas of the State have seven pediatricians per 100,000 children.

Private Medical Care of Children

One of the unique findings of the study concerns the medical care received by children. For the first time we have data on the services rendered by a large group of general practitioners and specialists. Of the 19,756 physicians in private practice, 12,259 reported, as requested, the number of child patient visits on one day of practice.

As seen in Fig. 4, in every area of the State, the major portion of the private medical care for children is rendered by general practitioners.

* Data from these states (Alabama, Illinois, Montana, New Hampshire, New Mexico, North Carolina, Oregon, and a composite state—Maryland, District of Columbia, and two nearby Virginia counties) were available for comparison before the national averages were released by the Academy of Pediatrics.

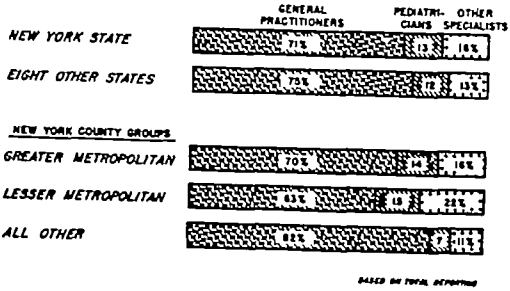

FIG 4 Chart illustrating who gives private medical care for children—per cent of all visits

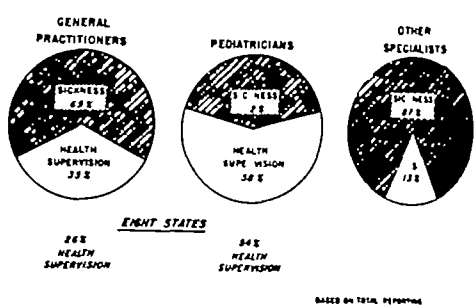

FIG 5 Visits for sickness vs visits for health supervision—per cent of total visits in private practice in New York State

This is perhaps the most significant observation from all the data on private medical care of children For the State as a whole, the proportion is 71 per cent, ranging from 63 in the Lesser Metropolitan Areas to 82 per cent in the outlying areas The total amount of private medical care rendered by pediatricians is somewhat less than that rendered by other specialists This is true for each of the major geographic divisions Specialists of all types care for a larger percentage of children in the big cities It would be surprising if this were not so because, as we have previously shown, more specialists are found in these cities In the less populated districts, the general practitioners take care of most of the children They provide 82 per cent of the private care This is similar to the findings in North Carolina, an essentially rural state, where general practitioners provide 79 per cent of the medical care for children [1]

Visits for Sickness Vs Visits for Health Supervision

Two thirds of the general practitioners' services are rendered to sick children, whereas only 42 per cent of the pediatricians' services are to sick children (Fig 5) A large percentage of pediatricians' services go for health supervision which consists of services such as regulation of feeding, immunization, and health examinations As might be expected, the bulk of the services of other specialists is for care of sickness in children The segment of service for health supervision by other specialists represents well-child visits by internists and obstetricians and indicates the extent to which these specialists are involved in pediatrics It is interesting to note that both the general practitioners and the pediatricians in New York State devote more time to health supervision than do practitioners and pediatricians in the group of eight states In the country generally, health supervision accounts for 28 per cent of visits by general practitioners and 56 per cent of visits by pediatricians [2] The pilot study state, North Carolina, reported that general practitioners saw only one fifth of their patients for such health supervision Only a little more than a third of the visits of pediatricians in North Carolina were for purposes of health supervision It reflects a more widespread acceptance by parents in New York State of the physician's function of health supervision of the growing child

Volume of Private Care

The one-day record of visits submitted by general practitioners and specialists and the twenty-eight day record by pediatricians permit an estimate of the relative amount of private care received by children in the three major geographic groupings Children in the Greater Metropolitan Area received the most private medical care The ratio of visits to children was about 30 per cent less upstate than in the Greater New York Area The differences are smaller with respect to private care for illness than for health supervision The upstate figure for care during illness was about 20 per cent less than in the New York City area, for health supervision, it was 40 per cent less Apparently this also reflects local mores with respect to medical services

Further analysis of our data shows that the great majority of general practitioners see, as a maximum, about 20 patients of all ages in one day and that the average daily number of patients treated is about 12 * Pediatricians see on the average about 11 private patients per day, although 39 per cent of them report seeing between 10 and 20 patients The other specialists who reported visits see on the average of eight patients per day

Nearly one third of the general practitioners reported that on the day specified they had made no visits at all to children, while about 60 per cent of them reported that they had treated between one and ten children during the day About two thirds of the other specialists who re-

* Sundays holidays and days off are included in making these averages.

ported had seen no children on the specific day studied, while only 3 per cent had treated ten or more children on that day

General practitioners also report treatment in more specialized fields for children About 20 per cent of them reported that they did major surgery for their child patients, and 34 per cent reported that they did tonsillectomies for children. Only 5 per cent of the pediatricians performed tonsillectomies, however The majority (71 per cent) of general practitioners take care of the feeding problems of the children under their care.

Place of Treatment

General practitioners and pediatricians, according to our data, see 59 per cent of their child patients in their own offices They see 27 per cent in the children's homes and treat the remainder in hospitals Specialists in other fields see more than half (54.1 per cent) of their child patients in their own offices Nearly two fifths of their services are rendered in hospitals, and only 6 per cent of their care is given in the child's home. This distribution of service between home, office, and hospitals as regards specialists is, of course, to be anticipated, since surgery is the major field covered by the nonpediatric specialists.

Other Professional Activities

The physicians also reported on the amount of time they had devoted during one month to child health conferences, school health services, and other medical activities aside from their private practices Their reports show that one out of every eight general practitioners and almost one out of every three pediatricians participates in child health conferences The general practitioners who participate devote an average of over eleven hours per month to this work, the pediatricians, over ten hours

Ten per cent of the general practitioners and 15 per cent of the pediatricians of those who replied to this question stated that they participated in school health services during the past month Of these physicians, the general practitioners again devoted more time to the work, averaging twenty-one hours per month as against fifteen hours given by the pediatrician group

Practically all of the pediatricians (95 per cent) and a little more than a third of the general practitioners (34 per cent) reported that they had participated in other medical activities aside from their private practices During the month studied, the pediatricians devoted an average of thirty-four hours to this work, the general practitioners an average of twenty-four hours

Pediatric Preparation of Physicians

About 90 per cent of all general practitioners in the State had had at least a year's internship (Fig 6) A substantial number had two years or more of hospital training Almost 70 per cent of those in general practice in the Greater Metropolitan Area have had two years or more, 53 per cent in the outlying counties have had two years or more It is in the group of physicians over forty-five years of age where hospital training is lacking, 14 per cent of those forty-five and over had no hospital training, only 4 per cent of those in the younger group

It is of interest to compare this lack of hospital training with other states Figure 7 indicates that relatively more general practitioners in New York State have hospital experience than in the country generally In fact, for the group of eight states the proportion of general practitioners without hospital training was twice as great as in New York State

Of considerable importance to medical education is the finding that, in New York State, 33 per cent of the general practitioners had had little or no pediatric training after graduation This

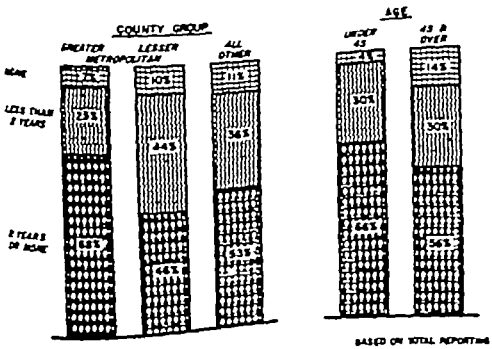

FIG 6 Hospital training—general practitioners in New York State

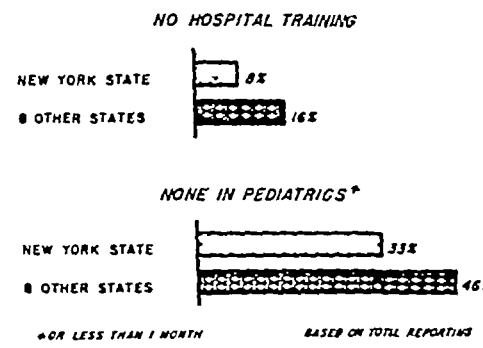

FIG 7 General practitioners lacking hospital training

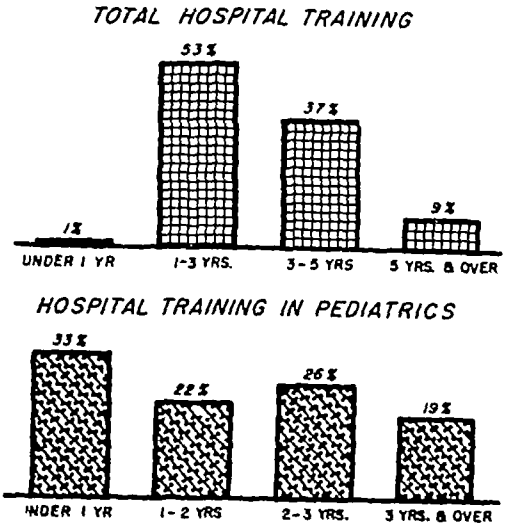

FIG 8 Hospital training of pediatricians in New York State

fact, together with our previous observation that more than 70 per cent of private medical care to children is rendered by general practitioners, stresses the need for more pediatric training for general practitioners, not only in medical school and hospital service but after they have established themselves in practice In spite of this, New York again compared favorably with the national average, with 45 per cent of the general practitioners lacking pediatric training

Hospital Training of Pediatricians

It will be recalled that the definition of a pediatrician in the study was the physician's own statement that he limited his practice to children This may account for the fact to be noted in Fig 8 that a third of the physicians who said they limited their practice to children had less than a year of hospital experience in pediatrics To be eligible for certification by the Board of Pediatrics, a physician must have had at least two years of pediatric hospital training in addition to other pediatric experience As previously stated, slightly more than half of the pediatricians in the State are certified by the Board as specialists

Summary

1 New York State is comparatively rich in physicians in all categories

2 Greatest concentration is in the urban areas, especially New York City

3 Rural areas of New York State compare favorably with other states as regards availability of physicians

4 The bulk of private pediatric care is rendered by general practitioners

5 New York State's general practitioner see one third of their child patients for health supervision

6 Compared to those other states where data are available, hospital training of New York physicians is better than average

7 Although general practitioners render the bulk of medical care for children, a third of general practitioners report little or no hospital training in pediatrics

8 Most of the pediatricians are located in the major population centers

9 The postgraduate training of New York pediatricians is better than average, although a third have had less than one year of hospital training in pediatrics

10 The study points to the need for emphasis on pediatrics in postgraduate medical education especially for the general practitioner who provides 71 per cent of the private medical care to children in the State

Comment

This information and the data on hospital and health service which are to be reported later should be of unique value in planning child health services All too frequently, discussions concerning the lacks and gaps in health services for children have been conducted largely on a speculative and theoretic basis Missing has been information as to the amount of service rendered by the chief dispenser of medical care—the private physician This study has obtained data from 62 per cent of the practicing physicians in the State * For the first time, we have a picture of the enormous volume of child care rendered by private physicians, both in the treatment of illness and in the prevention of disease The study is also notable for the fact that it was initiated by physicians and carried out by them

No doubt, some of the facts which we will have available in the completed report are already familiar to one or more of the medical groups interested in the findings, for example, data on hospital services and public health services These facts, however, have been unfamiliar to many physicians who will now have a better understanding of them This can be one of the most important by-products of the study For the physicians who have actively participated in the study, it has had real value as an educational process in community health organization We physicians have learned not only much about the volume of services rendered in this State to chil-

* Our original mailing list of physicians totaled 22 309 from whom we received 16 234 or 73 per cent returns. Of the 13 756 physicians in private practice 12 259 physicians or 62 per cent reported child visits.

dren, but we have learned a great deal about the State and the many agencies which exist to supplement the work of the practicing physician

Many persons have contributed to make this study a reality Not the least have been the individual physicians and dentists who took the time from their crowded days to answer our questionnaries We thank them for their help and their patience with us We think that securing a return of 73 per cent of our questionnaires is a remarkable achievement It shows an interest and a willingness to cooperate in a medico-social effort on the part of physicians which must confound critics of "organized medicine" The complete report, we are confident, will be a guide for intelligent action by the medical profession and other organizations concerned with the health of children in our State

Mr Herbert Marks medical statistician of the Metropolitan Life Insurance Company gave expert assistance in the review further analysis and interpretation of the statistical data in this report.

SUPRASPINATUS TENDONITIS CALCAREA

J V Robbins, M.D , Port Jervis, New York

(From the Department of Surgery St Francis Hospital)

LESIONS of the supraspinatus tendon including the subacromial bursa are the commonest causes of pain in the shoulder in adults This was pointed out by Codman in 1934 [1] The literature covering this subject describes in great detail the incidence, cause, and pathogenesis of this condition.[2-7] Suffice it to say that supraspinatus tendonitis calcarea is a condition occurring only in adults in the most active period of life and is due to repeated small traumas of the supraspinatus tendon and its intimately connected bursa while impinging against the acromion. Calcification of the tendon and bursa is a natural sequence of pathologic events

The diagnosis of supraspinatus tendonitis calcarea depends upon a careful history, physical and roentgen examination. Pain, the outstanding complaint, is localized in the anterior portion of the shoulder, inferior to the acromion, varying from mild to agonizing, and having been present from one week to six months Limitation of abduction and internal rotation is a secondary complaint due to aggravation of the pain produced by these motions The patient cannot place the hand of the affected extremity on the back of his head nor behind the small of his back The pain is worse at night and on sitting down. It is relieved when the arm hangs unsupported, due to the humeral head dropping away from the acromion in this position. The history reveals a type of occupation requiring repeated and constant abduction over a period of years Physical examination will reveal a site of exquisite tenderness, which I will call the "trigger area," just inferior to the acromion in the anterior aspect of the shoulder Roentgen films of the affected shoulder revealing calcification of the supraspinatus tendon complete the diagnosis Films should be at least three in number, in various degrees of rotation of the humeral head, otherwise small or early calcium deposits may be missed A Bucky-Potter grid and high detail screens are used

The treatment of calcification of the supraspinatus tendon by infiltration, multiple needling, and aspiration was first used by the author while a member of a surgical group overseas in the recent war These records are not available, but this paper is a report of the method and treatment used during the past two years in 52 cases in a general surgical practice with very favorable results in the large majority of cases Lapidus in 1943 reported a series of 34 cases in which a similar procedure was used with prompt relief of pain and recovery [8] The occupational distribution of the cases in this series is shown in Table 1 All patients in this group gave clear-cut histories consistent with supraspinatus tendon stretching under tension day after day These cases all presented the criteria of "trigger

TABLE 1.—Occupational Distribution of 52 Cases of Supraspinatus Tendonitis Calcarea

Occupation	Number of Cases
Machine operators	11
Housewives	7

Typists	5
Painters	4
Coal shovelers	3
Masons	3
Machinists	3
Telephone operators	2
Bakers	2
Airplane pilot	1

area" and positive x-ray findings of calcium deposit

The technic is as follows The patient is placed in an armchair with the elbow of the affected side resting on an arm The "trigger area" is carefully marked with a colored antiseptic, and the skin in this area is infiltrated with 1 cc of 2 per cent procaine Through the same skin puncture, a 19 gauge, 3-inch needle is introduced perpendicularly into the body of the calcareous deposit The patient should experience pain when the needle penetrates this deposit Should there be no painful sensation, the needle is not correctly placed, and a poor result will ensue should the treatment be continued The physician, being satisfied that the needle is correctly placed, begins the injection A syringe containing 20 cc of 1 per cent procaine is connected to the needle which is transfixing the calcareous deposit, and while injecting the solution slowly and steadily, the needle is repeatedly but partially withdrawn and inserted ten to twenty times, depositing the procaine in a fanlike manner in all directions radiating from the site of the original puncture Grating of the needle point against the calcium is usually felt as it is thoroughly needled, although, if the calcium is very soft, this may not be noticeable Aspiration is frequently attempted during the procedure of infiltration, and although these attempts are usually fruitless, occasionally one will aspirate 1 to 3 cc of milky fluid Should this be the case, the treatment may be concluded then and there, and an excellent prognosis offered The needle point frequently hits the cortex of the humeral head, but I have found that this does not produce any untoward effects When properly performed, the infiltration of the procaine is soon followed by an excellent analgesia and, with the needle still in situ, 40 cc of warm isotonic solution of sodium chloride is infiltrated in a similar manner When the calcium deposit is rather extensive and widespread, I do not hesitate to infiltrate as much as 60 cc of normal saline

Upon the completion of treatment, the shoulder appears swollen, and the patient is instructed to try all types of motion immediately, especially abduction and internal rotation This he does with some hesitation in the beginning but soon finds that he has little pain and then moves the arm rather freely He is instructed to use the arm in his daily activity up to the point of more than moderate pain and told that the shoulder will probably be more painful for the next few days than it was before For this he is given sedatives and instructed that he may apply mild heat to the part but no massage Almost normal mobility without pain usually appears in an average of eight to ten days Should satisfactory improvement fail to appear in that time the entire procedure is repeated

No patient received more than two such treatments Two cases in this group who failed to respond to two treatments were relieved by excision of the subacromial bursa under local anesthesia Two cases, a coal shoveler with a bilateral lesion and a mason with a unilateral lesion, required another treatment eighteen months later with relief Thirty-nine cases were relieved with a single treatment Nine cases did not return for follow-up, and results on them were not available

Several cases were followed with x-ray The calcium deposit either diminished in size or disappeared in most cases within one to three months, but several patients still show fair sized calcium deposits two years later, yet remain symptom-free The absorption of the calcium is attributed to the needling and the fluid injected which results in hyperemia, increased circulation, and local leukocytosis

This treatment was also tried on three cases of acute painful shoulder with "trigger area" but no calcareous deposit with dramatic overnight relief The procedure was of no value in two cases of "frozen shoulder" where there was neither a "trigger area" nor calcium deposit

It may be pointed out that this condition is sometimes self-limited and self-curative, but there is no way of determining which case will or will not require special treatment The patient whose symptoms are severe enough to cause him to seek attention deserves the benefit of treatment and not watchful waiting

Conclusions

1 Acute supraspinatus tendonitis calcarea is one of the most common causes of pain in the shoulder in adults

2 The criteria of "trigger area" and positive roentgen findings of calcium deposit must be present to assure a favorable prognosis

3 Infiltration, multiple needling, and aspiration of the calcareous deposit is a safe and satisfactory treatment

4 The actual removal of the calcareous material is not essential for the relief of pain

COMMON ERRORS IN PEDIATRIC PRACTICE

HARRY BAKWIN, M D , New York City

(From the Department of Pediatrics, New York University, College of Medicine)

IT HAS seemed useful, from time to time, to review and assess the ideas and practices which we use in our everyday work As we glance back over the years, we are inclined to shake our heads in wonder at the tenacity with which our professional forefathers clung to practices which were not only useless but which were, not infrequently, actually harmful There is no reason to suppose, however, that the present time is a great deal different in this respect from any other Much which is now commonly considered to be the result of experience or demonstrated in the laboratory will be recognized at some future time as based on prevalent fashion or imperfect thinking

With this idea in mind I read a paper some four years ago, in which I recounted what appeared to me to be fallacious ideas and practices then in general use [1] I discussed indiscriminate tonsillectomy, the improper use of myringotomy in infants, indiscriminate hospitalization for the delivery of babies, the mishandling of infants and children in hospitals, principally from the psychologic viewpoint, the neglect of the physician to consider the psychologic attributes of children, and the overemphasis on dietetics and the underemphasis on good cooking In addition, I mentioned, among others, the unnecessary treatment of physiologic bowing of the legs, the premature use of orthodontia, the diagnosis and treatment of rickets because the ribs flare or the legs are bowed or the head shape is unusual, although rickets is not the cause, and the routine use of unnecessarily expensive sugars for babies, although their superiority over the much cheaper, ordinary cane sugar has not been demonstrated I also discussed briefly certain shortcomings in the education of the pediatrician

I fear that my discourse in 1944 has had little, if any, influence on pediatric practice in 1948 Except for indiscriminate myringotomy, which was on the way out anyway owing to the use of the chemotherapeutic agents, and some changes in the hospital care of newborn infants, erroneous practices persist much as before It is my impression that tonsillectomy is more popular than ever, taking its annual toll of some 80 to 90 lives from anesthesia, plus a considerable morbidity, costing society millions of dollars annually and taking up hospital beds unnecessarily More babies are born in hospitals than ever before In New York City the percentage of hospital deliveries is close to 100 The Boston Lying-In Hospital has closed its outdoor service because of lack of applicants for home delivery There has been some humanization of the hospital care of infants and a relaxation of the old aseptic ward technic, and a commendable interest is being shown in the psychologic attributes of children As far as the dietary situation is concerned, mothers still get upset unnecessarily because their children are not getting balanced diets, and the vitamin business is booming The education for the practice of pediatrics is as unrealistic as before

However, I shall proceed today to recount further pediatric practices which, to me, seem erroneous

Care of the Newborn

Shaw, in a paper entitled, "The Most Unphysiologic Period of Life," has compared the natural course of neonatal development with the artificialities of modern care [2] He points out that the newborn infant is endowed with an adaptive pattern of existence Primitively, the infant was born with a minimum of midwifery He was bedded with his mother and promptly put to her breast At first he secured only small amounts of colostrum, but gradually the maternal milk supply was established and an adaptation effected between the needs of the baby and the nourishment supplied by the mother

The initial meagerness of the breast milk was accepted as a matter of course Loss of weight during the early days of life was expected, and whether or not this served a useful purpose, it seemed, at least, to do no harm. As a matter of fact, routine weighings were not done, nor were temperatures taken, and, consequently, dehydration fever was no problem. To be sure, the infant whose mother did not produce enough milk was unfortunate, and it is here that modern pediatrics has made a splendid contribution Delivery at home was the rule, and, consequently, the baby and mother were not exposed to the hazard of epidemic disease in the hospital

The entire course of birth and neonatal procedure has been modified in recent years Most infants are now delivered in hospitals Mothers are subjected to all sorts of procedures to alleviate

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Pediatrics May 21 1948.

the pain of childbirth and to expedite delivery. As a consequence, many babies are born sufficiently affected by hypnotic, narcotic, and anesthetic drugs to interfere with the normal mechanisms which initiate and maintain respiration. There is a growing conviction, based on clinical observation and experimental work, that the postnatal hypoxia may seriously affect the neonate with far-reaching and dismal effects on his future development and behavior.[54]

Although the majority of obstetricians and pediatricians give lip service to breast feeding, physicians and nurses seem to do everything possible to thwart it. Mother and baby are promptly separated after birth, and the baby is brought to the mother only at specified times which suit the hospital routine, regardless of the baby's demands

In many of the highly rated hospitals in New York City the mother is permitted to see her baby only once a day unless she happens to be nursing him. In one hospital, during an epidemic of neonatal diarrhea, mothers were not allowed to nurse their babies at all! The father, of course, is almost completely disregarded. He can see his baby once a day through a glass window—from 4 00 to 4 30 or from 8 00 to 8 30 P.M

In most hospitals—in New York City at any rate—it is customary to give a formula during the first few days of life, before the breast milk begins to flow, in a vain attempt to prevent the physiologic weight loss This practice discourages breast feeding since it blunts the baby's appetite, thus lessening the intensity of sucking which is a major factor in initiating and continuing the flow of milk.

A further drawback to delivery in the hospital is the effect which the early separation of mother and baby may have on the emotional relations between the two It is natural for the young of mammals, and lower forms as well, to cuddle and snuggle against the mother's body In this way the baby gets not only food, but warmth and skin-to-skin contact which is so soothing to him.

There is reason to believe that the pattern of mother-child relationship, set up during the early days of life, is even more important for the mother than for the baby There are many mothers who did not want to have a baby at this particular time, who are not matured to the point of accepting motherhood, or who are having a baby because they think they ought to, without any real desire to do so To some mothers, having a baby means an annoying interruption of work outside the home which is profitable or absorbing, or both

In these instances every effort must be made to establish, at the earliest possible moment, an in-

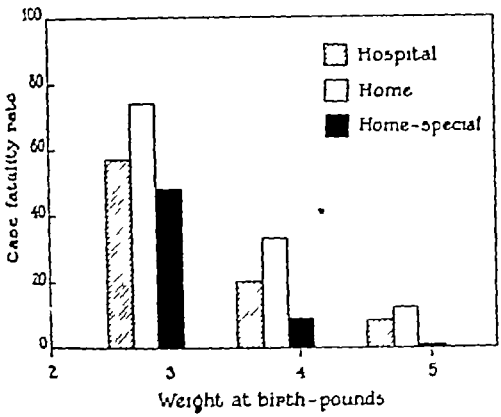

FIG 1 Comparison of the case fatality rates for infants cared for in a modern American premature unit ("Hospital"), at home without special nursing guidance, and at home with special nursing aid From data kindly supplied by Dr F J W Miller, Newcastle-upon-Tyne, England.

time The accuracy of predicting the duration of pregnancy was determined by Hotelling and Hotelling on data obtained from the clinic of the Lane Hospital in San Francisco [5] They found that the duration of pregnancy can be predicted within eleven days in two thirds of the cases and within twenty-two days in about 95 per cent of cases. It is customary among obstetricians to label as premature a baby who is born four weeks or more before term. It seems to us that a diagnosis of prematurity should be based on three criteria the length of gestation, the clinical appearance of the infant, and, lastly, the birth weight

More important for us, perhaps, than the definition of prematurity is the care of the premature Here, it seems to me we are making a major error to wit, all prematures require hospital care in a specially designed unit Nowhere in the American literature is there any intimation that the premature can be cared for at home The emphasis is on an elaborate, expensive hospital setup In this relation the experience of Dr Elaine Field in the care of prematures in London during the early years of World War II is worth mentioning [6] Her unit was in a side room off the obstetric ward in the basement of the hospital The premature room functioned also as the head nurse's office To this room, students, nurses and medical staff had free access Masks and gowns were worn by the nurse in attendance but rarely by the medical staff The results were not notably different from those obtained in the much more elaborate American premature units Although the number of cases in her series was too small for accurate statistical comparison, they indicate that babies, 3½ pounds and over, fared at least as well as do ours

Even more significant are the results of F J W Miller of Newcastle-upon-Tyne, who reported on the care of prematures in the home (Fig 1) [7] Newcastle-upon-Tyne is an industrial city of 265,000 inhabitants in the north of England Housing conditions there are very bad Dr Miller writes that, even before the war, Newcastle achieved the unenviable distinction of being one of the most over-crowded areas in England and Wales Since then, the housing situation has become worse Because hospital facilities are inadequate to take care of the more than 300 prematures born each year, a home service has been organized Specially trained "premature nurses" are provided to visit the homes on request and to give instructions to the mother Necessary equipment is sent out in a hospital ambulance One nurse can take care of three babies in this

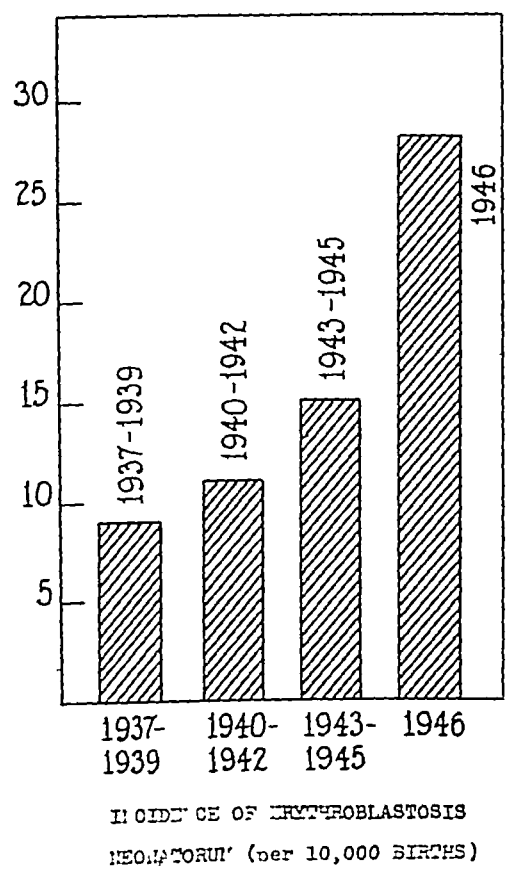

FIG 2 The incidence of erythroblastosis neonatorum at the Johns Hopkins Hospital, calculated from the data of Hallman and Vosburgh [8]

way She acts as friend, helper, and teacher At present, no charge is made for this service

The number of cases taken care of in this way is, as yet, small However, of 82 babies weighing between 3½ and 4½ pounds, 75, or over 90 per cent, survived, as did all 44 babies weighing between 4½ and 5½ pounds Thirteen out of 25 babies weighing between 2½ and 3½ pounds survived Eight babies weighing less than 2½ pounds died The study is being continued, and there will soon be enough cases for a more accurate evaluation of this system of premature care

At present, the cost of private care for a premature in a hospital is well-nigh prohibitive Moreover, there are other disadvantages to the hospital care of the premature The possibility of estrangement between mother and baby, owing to their separation in the obstetric hospital, is greatly increased when the baby is premature and consequently remains in the hospital for weeks, sometimes months, after birth When the baby finally does come home, the mother, imbued with the notion of the baby's fragile state, is often afraid to handle him as freely as is necessary

Miller's study indicates that the indiscriminate hospitalization of prematures weighing 3½ pounds or over is unnecessary We need further studies on the indications for hospital care of prematures and on the best methods to use in the home

Transfusions

For the past twenty-five years blood transfusions have been used freely in babies They have been used in the treatment of infants with severe diarrhea, in undernourished infants, in infants with moderate degrees of anemia, in infants with bronchopneumonia Before the discovery of vitamin K, intramuscular blood injections were often given to newborns after difficult delivery to supply prothrombin and thereby lessen the tendency to bleed Intramuscular blood was also used as a prophylactic against measles before immune serums were developed The general attitude toward transfusion was that, if the bloods of donor and recipient were properly matched, it could do no harm Of course, even with careful checking, occasional fatal transfusion reactions resulted

There is ample evidence to show that many of the transfusions, which were given so blithely in years gone by, did do harm Transfusion of women who are Rh negative with blood which is Rh positive sensitizes them so that their Rh positive offspring suffer from erythroblastotic anemia of the newborn How important a factor sensitization by transfusion is in the incidence of this very serious disease was brought out by a recent report by Hellman and Vosburgh [8] They found that the incidence of erythroblastotic anemia of the newborn at the Johns Hopkins Hospital rose from 9 per 10,000 in 1937 to 1939 to 29 per 10,000 in 1946 (Fig 2) At the same time transfusions increased from 1,100 in 1939 to 5,585 in 1946, a fivefold increase

Between 1937 and 1946, inclusive, there were 27 cases of erythroblastotic anemia Seven of the mothers, approximately one fourth, gave a history of transfusion. One of these, a woman of twenty-one, had received a transfusion when she was two months old Two more women had received transfusions and developed antibodies, but their children were, fortunately, Rh negative and hence escaped These nine women had had five normal children prior to their transfusions but only two normal infants afterwards

That transfusion and intramuscular injection of blood may sensitize a woman who is Rh negative and thus render her incapable of bearing normal children who are Rh positive has been known for some time The important feature of Hellman and Vosburgh's study is the demonstration of the frequency with which transfusion of the mother may be an etiologic factor

The induction of sensitivity in an Rh negative mother is not the only harm which may result from transfusion Karelitz, Bass, and Moloshok recently reported an unusual outbreak of acute fulminating hepatitis resulting in death, with acute yellow atrophy of the liver in four babies and active hepatitis in two more [9] Five of these children had received plasma, the sixth an exchange transfusion These important observations point up another hazard in the use of transfusion At present, it is the greatest hazard, since there is no known way of preventing the jaundice transmitted in this way

Psychologic Care

Pediatric practice is in a transitional stage We are passing from the rigid prescriptions and exact formulations of yesterday to a keener appreciation of human variability and a better understanding of the need for individualization in child care This change in attitude is more revolutionary and more far-reaching than the discovery of the chemotherapeutic agents and antibiotics In some respects the present trend has not gone far enough It is not surprising that, in other respects, it has gone too far

You will recall that, until recently, we told mothers not only exactly what to feed their babies and how much and when, but how much sleep they were to have, what the temperature of the nursery should be, what days they were to be

...ken out, etc. The aim of the child psychologist was to "adjust" children to a preconceived standard. To some extent this sort of spoon-feeding continues, principally because most parents like to have specific directions, but also perhaps, because the implication of modern pediatrics has not been stated with sufficient clearness. The modern concept of child care is, as I see it, that the parent and not the physician is responsible for the child's welfare. Each child must be recognized as an individual, differing from every other child that ever was born or will be born. The parents will know their child better than any one else—certainly better than the pediatrician who sees the child once a month or so. The pediatrician gives advice from his knowledge of children in general, the application of knowledge must, in the final analysis, be made by the parent. From the very beginning, the parents must be made to feel that they are the responsible ones and that they cannot shirk their responsibilities to others. This should be made clear to the parents at the first visit in the obstetric hospital and should be repeated again and again.

Advice along these lines need not create anxiety in the parents if we temper our remarks by pointing out that child-rearing is a function for which woman is, by nature, endowed. After all science has come to appreciate that the attitudes and gestures which the mother intuitively uses toward the baby are the ones which are best suited to please and soothe and comfort him.

I mentioned that in certain respects the pendulum has swung too far. A principle of modern pediatrics, which seems to be well established, is that the child's developing potentialities should give the cue for his management, not a preconceived pattern in the mind of the physician or parent.

This principle, of allowing the child's maturing capabilities to be the guide to management, has led in too many instances to a policy of overindulgence. It seems to me that this is a worse error than the old rigidity. Whereas formerly we had too much regulation, now we have too little. To feed a baby whenever he cries—so-called self-demand or self-regulation—is hardly conducive to the management of an orderly household, especially when babies readily adjust to a schedule after the first two or three weeks of life.

To concede to every demand of the child does not lead to the formation of a well-balanced personality. The very freedom which is sought by this overpermissive attitude is lost. The child is expected by the overindulgent parent to define for himself the limits of his freedom, a decision for which he is not ready developmentally and for which he lacks experience. Discipline is just as necessary now as it ever was. We live in a social world. Child-rearing implies among other things training in self-restraint and in appreciation of the rights of others.

Widespread Use of Penicillin

It is hardly necessary to mention how widely penicillin is used for mild infections in children. I am not at all clear on the reasons for this. Penicillin is said to be less toxic than sulfadiazine. This is undoubtedly true in adults, but I doubt whether the same holds for children, especially young ones. One occasionally sees febrile responses and rashes following sulfa therapy, but the physician quickly learns which of his patients show these reactions, and he avoids its use in these. Urinary complications are unusual in children probably because the volume of urine is relatively large.

Sulfadiazine has the great advantage of simplicity of administration and cheapness. In most of the infections for which it is given, its antibacterial effect is on a par with that of penicillin.

The question of expense is one which should not be taken lightly. Medical costs are rising. What with the widespread use of oxygen, parenteral fluids, x-rays, injection therapy, and the high cost of hospital and nursing care and laboratory procedures, the physicians' fees are becoming a minor part of the cost of medical care. Patients will have what they consider proper medical care whether they can pay for it or not. If they haven't the money to pay for it, they will borrow, cheat, lie—finally, they are going to ask the state to pay for it.

There are, without question, indications for the use of penicillin. In the everyday practice of pediatrics however, where minor infections are under consideration, sulfadiazine is the drug of choice.

Overreliance on Hospital Care

Only a few years ago the hospital was reserved for those with serious illness. Things are certainly different now. Children are sent to the hospital on the slightest provocation. Although there are many reasons for this change of attitude, we must bear our share of the blame for this trend. Too often one hears a colleague say, "I would feel better if my patient was in the hospital." Without question it is a great relief to the physician to be able to share responsibility for the care of a sick child with others—there should be fewer "coronaries" among physicians of the future—but often this is not in the best interests of the patient.

Especially is this true of infants. By and large they do badly in hospitals. At home the baby

in the home has a full-time, twenty-four-hour nurse, the mother, to care for him. She understands his wants and his idiosyncrasies and is unsparing in her efforts In the hospital, by contrast, he is cared for by at least three different nurses whose primary interests are usually elsewhere He is exposed to ward infections and to a hospital routine which is new and disturbing Only occasionally do the gadgets available in the hospital compensate for its disadvantages Moreover, most procedures can be carried out in the home A healthy move away from overhospitalization has already begun. At the Montefiore Hospital a program for the home care of patients with cancer is under way and is highly successful

Stated in general terms, we err too often because of our willingness to accept an idea which seems reasonable even though it has not been proved, because we fail to make allowance for human variability, and because of an overwillingness to adopt the complex and expensive when the simple and cheap are as good or better On the other hand, we are unwilling to rely on the adaptability of the human organism with the consequent resort to corrective devices which are often harmful We tend to rush in with therapeutic procedures where knowledge is incomplete We are too prone to adopt the attitude that "this or that procedure can do no harm," and too often we feel that now we have the answer, when all that has been accomplished is to lift a little the veil of ignorance

Summary

I have outlined in this talk some of the more common errors in pediatric ideation and practice as I see them These errors are not isolated ones but are an integral part of every-day practice This is not to imply that I feel that we are not making progress I feel very definitely that we are going forward I have tried, merely, to point out the countercurrents in the onward flow of pediatric knowledge We have it in our power to do much that is good Let us not dilute the benefactions which it is in our power to bestow by practices which may be harmful

Discussion

John D Craig, M.D , *New York City* —I will limit my discussion to those subjects in which I do not agree with Dr Bakwin's views or to those that I feel should be emphasized

Indiscriminate Tonsillectomy —It has been my impression that in the past ten years, especially among pediatricians, the trend has been to do tonsillectomies only on those patients where there have been definite indications after carefully weighing the facts. Available data on this subject are scarce, and I do not know the importance of Dr Bakw opinion, since he did not give us necessary supp ing figures

Care of the Newborn —The onus of the use of mula feeding in babies only a few hours old, whe to keep them quiet or to prevent loss of weight most instances, lies directly with the doctor simple, direct order (written) that newborns s have nothing by mouth for the first twenty-f hours, and glucose water for the second twenty-f hours will be carried out in the same way that ot written orders are carried out

Rooming-In —Some great need at the tu whether good or bad, created the change from ho delivery to hospital delivery The present trend the rooming-in system requires expensive structu changes in existing hospitals Would it not be b ter to encourage the liberalization of rules and re lations pertaining to the visits between mother a baby, in order that they may be carried out wit the structural setups we have? When the baby g home, usually within a few days, he will have to into the available space, i.e , if there is a spare ro he will be put there, and, if not, he will be put w the other children or the parents

Premature babies —We do keep healthy sm babies in the hospital too long In Dr Hess's p mature center in Chicago he allows them to go ho at $4\frac{1}{2}$ pounds In New York City the Board Health suggests that they be kept until weighi $5\frac{1}{2}$ pounds As a first step could we not at le ease this back to 5 pounds for those who are do well

Penicillin and Sulfa Therapy —Even too mu sulfa is prescribed where there are no definite clini indications, especially in the simple, upper respi tory infections Any number of times a mother h told me that after a moderate fever her child h been cured by two doses of sulfa. This is, of cours not true It might be better to stick to your aspiri at the same time, leave a prescription for your favo ite sulfa drug to be started, either by telephone when you re-examine the child

Overreliance on Hospital Care —I have alwa thought it was far easier for a doctor to practice an urban community than in the country If he rushed or does not wish to take the time to obser the patient until hospitalization is indicated and e plain same to the parents, he is prone to hospitali the patient and let the resident work the case up f him The country doctor is on his own Unle hospitalization is clearly indicated, it would be bett to wait before you consider it Ask yourself, is really necessary?

RECENT CONTRIBUTIONS TO THE DIAGNOSIS AND TREATMENT OF PERTUSSIS

WILLIAM L BRADFORD, M D , Rochester, New York

(From the Department of Pediatrics, University of Rochester School of Medicine and Dentistry)

IN THE United States, during the past twenty-five years, we have observed a declining mortality rate in whooping cough This trend, which is shared with certain other infectious diseases, has occurred in urban communities chiefly In spite of this favorable trend, the disease remains one of importance, for the case fatality rate among hospitalized patients under twelve months of age remains between 5 and 10 per cent

The general case fatality rate is about 2 3 per cent, although in certain surveyed areas it has been found to be as low as 0 35 per cent Forty-seven per cent of the 10,730 deaths from whooping cough recorded in the United States (1938 to 1940, inclusive) occurred during the first seven months of life In New York State, pertussis causes about 6 per cent of the infant mortality rate According to Kohn and Fisher, the case fatality for patients ill with whooping cough in the Willard Parker Hospital during the past eight years was equal to, or above, the combined fatality rates of measles, scarlet fever, and diphtheria [1]

The highest death rate now occurs in rural rather than urban populations In such areas Dauer found it to be directly related to poor living conditions, poverty, crowding, and inadequate professional care [2]

In the last fifteen years, considerable advancement has been made in the study of pertussis, resulting from a general renewal of interest in various aspects of the problem Among important contributions may be mentioned the following (1) proof that Hemophilus pertussis alone causes the disease, (2) demonstration that antigenically active strains of the organism are required for the production of effective vaccine, (3) establishment of the disease experimentally, (4) studies of the antigenic structure of the organism, (5) production and use of immune serum for passive prevention and treatment, (6) improvement of culture medium, and (7) improved methods of laboratory diagnosis

Cultural methods are particularly important from the standpoint of the laboratory diagnosis which seems to be an increasingly important practical problem The typical case of pertussis offers little diagnostic difficulty, but the widespread use of vaccine results in a growing number of modified cases when complete protection fails to occur These mild cases often constitute diagnostic difficulties, and they also represent important epidemiologic problems Moreover, other diseases of the respiratory tract—infections of the postnasal region, enlargement of pentracheal lymph nodes, allergic bronchitis, parapertussis, and even infection with Brucella bronchiseptica and Brucella abortus—have been confused clinically with pertussis During the past few years my attention has been attracted to the marked similarity which sometimes exists between the cough of so-called "atypical" pneumonia and that of whooping cough Experienced physicians have come to realize that every patient who whoops does not have whooping cough, and, conversely, that whooping cough may exist without the whoop For this reason the name "pertussis" is preferred to that of "whooping cough" by some physicians

Since 1916, the cough-plate method of Chievitz and Meyer has been used, routinely by some, for the isolation of the causative organism Because of certain difficulties encountered with this method, the nasal-swab method was introduced in 1940 In our hands, as well as in the hands of others, this method has represented a distinct improvement over the cough-plate method, especially in infants [3]

Some workers have advocated the use of agglutination and complement fixation tests to measure the level of humoral immunity, while others believe that the mouse-protective test is superior It seems probable that an agglutinative titer of 1 320 or higher is indicative of resistance to infection However, it is also clear to those who are experienced observers that certain individuals who possess a lower titer, or even none at all, are immune The recent demonstration by Keogh and his coworkers in Australia, that freshly isolated strains of H pertussis possess hemagglutinins for the red blood cells of man and certain other species and that a specific inhibitory antibody against this reaction can be demonstrated in the serum of immune persons, suggests another, perhaps a sharper method, of distinguishing the susceptibles from the immune [4] No doubt, you have anticipated the development of a simple skin test, similar to the Schick reaction which would be made available

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Pediatrics May 20 1948.

in the home has a full-time, twenty-four-hour nurse, the mother, to care for him. She understands his wants and his idiosyncrasies and is unsparing in her efforts. In the hospital, by contrast, he is cared for by at least three different nurses whose primary interests are usually elsewhere. He is exposed to ward infections and to a hospital routine which is new and disturbing. Only occasionally do the gadgets available in the hospital compensate for its disadvantages. Moreover, most procedures can be carried out in the home. A healthy move away from overhospitalization has already begun. At the Montefiore Hospital a program for the home care of patients with cancer is under way and is highly successful.

Stated in general terms, we err too often because of our willingness to accept an idea which seems reasonable even though it has not been proved, because we fail to make allowance for human variability, and because of an overwillingness to adopt the complex and expensive when the simple and cheap are as good or better. On the other hand, we are unwilling to rely on the adaptability of the human organism with the consequent resort to corrective devices which are often harmful. We tend to rush in with therapeutic procedures where knowledge is incomplete. We are too prone to adopt the attitude that "this or that procedure can do no harm," and too often we feel that now we have the answer, when all that has been accomplished is to lift a little the veil of ignorance.

Summary

I have outlined in this talk some of the more common errors in pediatric ideation and practice as I see them. These errors are not isolated ones but are an integral part of every-day practice. This is not to imply that I feel that we are not making progress. I feel very definitely that we are going forward. I have tried, merely, to point out the countercurrents in the onward flow of pediatric knowledge. We have it in our power to do much that is good. Let us not dilute the benefactions which it is in our power to bestow by practices which may be harmful.

Discussion

John D. Craig, M.D., *New York City*.—I will limit my discussion to those subjects in which I do not agree with Dr. Bakwin's views or to those that I feel should be emphasized.

Indiscriminate Tonsillectomy.—It has been my impression that in the past ten years, especially among pediatricians, the trend has been to do tonsillectomies only on those patients where there have been definite indications after carefully weighing the facts. Available data on this subject are scarce, and I do not know the importance of Dr. Bakwin's opinion, since he did not give us necessary supporting figures.

Care of the Newborn.—The onus of the use of formula feeding in babies only a few hours old, whether to keep them quiet or to prevent loss of weight, in most instances, lies directly with the doctor. A simple, direct order (written) that newborns shall have nothing by mouth for the first twenty-four hours, and glucose water for the second twenty-four hours will be carried out in the same way that other written orders are carried out.

Rooming-In.—Some great need at the time, whether good or bad, created the change from home delivery to hospital delivery. The present trend to the rooming-in system requires expensive structural changes in existing hospitals. Would it not be better to encourage the liberalization of rules and regulations pertaining to the visits between mother and baby, in order that they may be carried out within the structural setups we have? When the baby goes home, usually within a few days, he will have to fit into the available space, i.e., if there is a spare room he will be put there, and, if not, he will be put with the other children or the parents.

Premature babies.—We do keep healthy small babies in the hospital too long. In Dr. Hess's premature center in Chicago he allows them to go home at 4½ pounds. In New York City the Board of Health suggests that they be kept until weighing 5½ pounds. As a first step could we not at least ease this back to 5 pounds for those who are doing well?

Penicillin and Sulfa Therapy.—Even too much sulfa is prescribed where there are no definite clinical indications, especially in the simple, upper respiratory infections. Any number of times a mother has told me that after a moderate fever her child has been cured by two doses of sulfa. This is, of course, not true. It might be better to stick to your aspirin at the same time, leave a prescription for your favorite sulfa drug to be started, either by telephone or when you re-examine the child.

Overreliance on Hospital Care.—I have always thought it was far easier for a doctor to practice in an urban community than in the country. If he is rushed or does not wish to take the time to observe the patient until hospitalization is indicated and explain same to the parents, he is prone to hospitalize the patient and let the resident work the case up for him. The country doctor is on his own. Unless hospitalization is clearly indicated, it would be better to wait before you consider it. Ask yourself, is it really necessary?

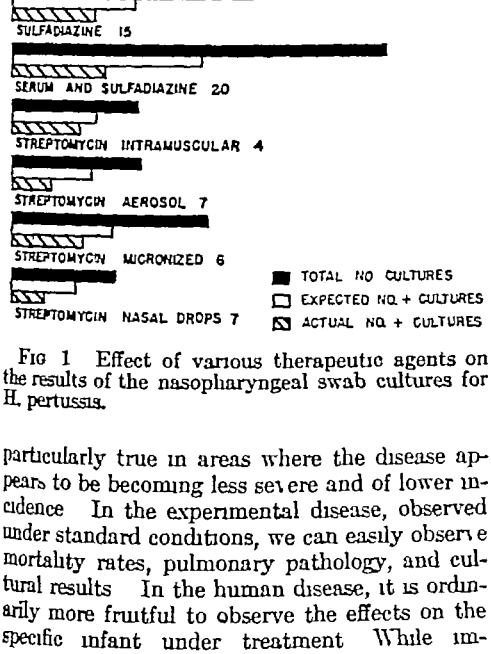

FIG 1 Effect of various therapeutic agents on the results of the nasopharyngeal swab cultures for H. pertussis.

particularly true in areas where the disease appears to be becoming less severe and of lower incidence In the experimental disease, observed under standard conditions, we can easily observe mortality rates, pulmonary pathology, and cultural results In the human disease, it is ordinarily more fruitful to observe the effects on the specific infant under treatment While improvement of clinical symptoms, such as lessening of the cough and decrease in vomiting, usually result from effective therapy, these are variable symptoms, and their evaluation introduces the factor of clinical impressions

It is, therefore, useful to observe the effect of a therapeutic agent on such objective criteria as the disappearance of the causative organism from the respiratory tract, the trend of number of leukocytes, and the prevention of hilar lesions, as shown by the x-ray The results of

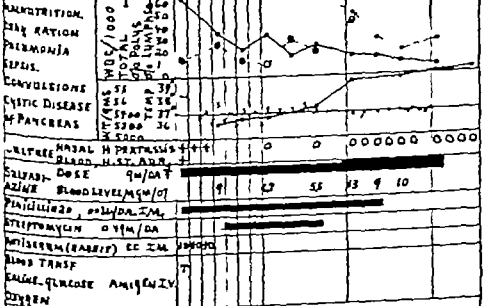

FIG 2 Influence of various therapeutic procedures on the course of severe pertussis.

some of our observations in respect to the f two criteria are illustrated in Figs 1 and 2

Summary

Relatively recent studies in pertussis have in cated the following

1 The necessity of the use of cultural meth to supplement clinical diagnosis The nasal c ture method which is superior for this purp should be more widely applied Bacteriolo diagnosis is particularly important when spec preventive and therapeutic agents are be tested

2 General therapeutic measures for seriou ill patients should include adequate professio care, the maintenance of proper nutrition, a the administration of oxygen.

3 Immune serum of high antibacterial tit either human or rabbit, is indicated There evidence that antitoxin serum is also of the peutic value, as is also sulfadiazine Prelimin studies suggest that streptomycin may be the peutically effective, particularly as a supplem to other agents

Discussion

Jerome L Kohn, M D, *New York City*—Fr our experience at the Willard Parker Hospital, per cent mortality rate for infants under one y is excellent There are children in whom th has been such extensive damage to the nervous s tem before admission that survival is impossib In others there is almost complete consolidation a atelectasis of the lungs

There is no question that the nasopharyng culture is far superior to any other culture meth in use H pertussis is a very fickle bacteriu The bacteriologist must be specially trained. Wh we had a change of bacteriologists, the percenta of positive cultures dropped appreciably for se eral months

When considering the differential diagnosis, wish to add, to the list given by Dr Bradford, infa tuberculosis and cystic pancreatic fibrosis have had a number of children with these con tions in the last year The cough simulates that whooping cough

In our experience the Strean skin test was not much value The Flosdorf agglutination test w much more useful. Flosdorf suggested that t test be read within twenty-four hours, but we ha found it best to reread it after forty-eight a seventy-two hours This avoided many false po tives The test was often negative in young i fants, but in children over one year it was positi in 88 per cent of the patients tested The test b came positive about three weeks after the onset cough In a number of instances in which t nasopharyngeal cultures were positive the sk test was negative There were very few false po tives We occasionally obtained negative sk tests in the ward personnel.

for this purpose Considerable effort has been directed to this end Two materials that have resulted from recent studies on the antigenic structure of H pertussis are the agglutinogen and the heat labile toxin In the hands of certain investigators, particularly Flosdorf and Strean, these substances, when used as skin-testing materials, have given interesting if not promising results [5 6] It is interesting that the agglutinogen gives a positive reaction when immunity is present, while the toxin, like the Schick test, is positive when susceptibility exists It appears now from recently reported experiences that the agglutinogen is the more valuable of these two skin-testing materials

In recent years, my associates and I have been interested in applying methods of passive protection to the very young infant who is either exposed or who is in the early period of the disease It was observed that convalescent and adult immune serum had occasionally been used for this purpose In 1936, Kendrick introduced hyperimmune human serum This work was actively extended by McGuinness and his associates, and its superiority over ordinary convalescent serum soon became apparent Laboratory tests revealed the high protective value of hyperimmune serum against the experimental disease in mice When this serum was injected into an infant during the catarrhal period of whooping cough, antibody values of the infant's serum comparable to those existing during convalescence were regularly observed This type of serum has proved effective in the prevention and modification of the disease

In 1939, it seemed practical to attempt the production of an immune rabbit serum This was originally prepared by injecting rabbits with suspensions of living, freshly isolated H pertussis The antiserum which resulted possessed high agglutinin and mouse-protective titers but very little antitoxin The globulin fraction prepared from this antiserum contained practically all of the antibody of the original serum and, when restored to the original volume, was as equally protective as was the original antiserum This antibacterial serum and a similar one prepared by Silverthorne and Brown have proved to be definitely effective in preventing the disease in exposed infants [7] Two other interesting types of antisera have since been introduced an antitoxin prepared by injecting rabbits with the toxic material obtained from the organism, and a combined antibacterial and antitoxic serum prepared by injecting the animal with both organism and its toxin. The antitoxin in high dilution neutralized the toxin, possessed a low agglutinative titer, but protected mice against the experimental disease resulting from either the intranasal or intra-abdominal route of inoculation The observations of Dr Katsampes, in our laboratory, indicate that the antitoxin also inhibits the development of hyperlymphocytosis, which characterizes both the murine and human type of infection Studies now in progress suggest that certain fractions prepared from hyperimmune human serum and whole blood plasma are also highly protective

In addition to the usual accepted methods of symptomatic treatments, such as the use of oxygen and adequate nursing care, it appears certain that sulfadiazine, penicillin (for control of secondary invading organisms), and the various types of immune serums are indicated Preliminary studies suggest that Aerosporin and Polymyxin may possess interesting therapeutic possibilities [8 9]

Since the organism is sensitive to streptomycin in concentration of from 1 to 3 micrograms per ml of medium, this agent has also been carefully tested against the experimental as well as the human disease [10] Although it is clearly effective in the treatment of experimental murine disease, definite conclusions cannot yet be drawn in regard to its value against the human infection

Treatment

When one considers therapy in whooping cough, one must keep in mind not only the fatality risk but serious sequelae, such as those of the cerebral and pulmonary type That seriously ill infants are best treated in properly equipped hospitals is readily admitted The findings of Dauer adequately support this opinion

The generally recognized essential requirements for the adequate care of an infant suffering from pertussis have been summarized in the recent paper by Kohn and Fisher [1] They are as follows

"1 An experienced medical and nursing personnel
2 The use of oxygen
3 Aspiration of the upper respiratory tract
4 Chemotherapy
5 Hydration and the use of parenteral therapy
6 Special feeding technic.
7 The use of hyperimmune and rabbit serums"

For more than a decade, we have been interested in testing the therapeutic value of various agents against the experimental murine disease When these agents proved protective, they were tried in the treatment of the disease in infants

As is well known, it is often difficult to assess the therapeutic value of an agent in a disease as variable in its clinical course as pertussis This is

NEW DEVELOPMENTS IN BCG VACCINATION

KONRAD E BIRKHAUG, M D , Albany, New York

(From the Division of Laboratories and Research, New York State Department of Health)

EXPERIMENTAL studies and clinical experience prove that a spontaneous primary infection with tubercle bacilli which renders the organism hypersensitive to tuberculin confers an incomplete but relatively significant resistance against a subsequent tuberculous infection and that the first victims of tuberculous disease are tuberculin-negative individuals who have escaped a spontaneous and nonprogressive primary tuberculous infection

A direct result of the modern trend to defer the primary tuberculous infection from childhood to adult life is an increasing susceptibility among tuberculin-negative individuals of early adult age to contract a serious clinical tuberculosis when they are intimately exposed to infection with tubercle bacilli This modern trend in the epidemiology of tuberculosis has brought about a reorientation toward the use of artificial immunization against tuberculosis by means of killed or attenuated living tubercle bacilli So far, only the avirulent and living BCG (Bacille Calmette-Guérin) vaccine has regularly produced hypersensitiveness to tuberculin and an incomplete but significant protection against tuberculosis The vaccine has been used in some ten millions of people during the past twenty years It is unrealistic, therefore, to claim that BCG vaccination is still in the experimental stage Nevertheless, there exists a lamentable lack of unassailable statistical proof of the effectiveness of BCG under rigidly controlled conditions in man, although such evidence is highly suggestive in animal experimentation Unanimity obtains, however, as to its harmlessness and near unanimity in regard to its almost complete protection against the clinical manifestations of postprimary tuberculosis in children and adolescents and an incomplete but highly significant protection against clinical pulmonary tuberculosis in adults

In a refreshingly critical article, Professor G S Wilson contends that the documentary evidence in favor of BCG vaccination is insufficient to prove conclusively that this mode of artificial immunization has any protective effect at all, at least in a civilized population like that of Great Britain [1] The past twenty years of uninterrupted BCG vaccination on more than one million persons in Scandinavia, which the author reviewed last year, provides the other side of the picture [2] Professor Arvid Wallgren of Stockholm, whose experience with BCG vaccination in children has placed him in the forefront of specialists on this subject, remarked recently that the vaccine has been so successful in Sweden that it would now be impossible to provide two identical groups of vaccinated persons and unvaccinated controls, because the physicians would regard it as unjustifiable to take the risk of leaving a control group unvaccinated merely to satisfy statisticians [3] He even goes so far as to counter Professor Wilson with the statement that no follow-up study of BCG vaccinated persons has so far been reported in which the vaccine has proved entirely ineffective, and this includes the New York City records of Levine and Sackett [4 5] Wallgren offers the opinion that countries which have adopted BCG vaccination are satisfied as to its value and they are not likely to abandon it until a more efficient prophylactic method is introduced He does not hesitate to advise his colleagues in countries which look on BCG vaccination with suspicion "Give BCG vaccination a fair trial, and you will be convinced of its effectiveness"

The country which is making the most energetic attack on tuberculosis is Norway, although her present tuberculosis mortality rate is less than 50 deaths per 100,000 population Norway has already enacted laws for the obligatory tuberculin testing of the entire school population, obligatory miniature chest radiographic examination of the entire population, and obligatory control of all open cases of tuberculosis On December 8, 1947, the Norwegian parliament passed a new law for the compulsory tuberculin testing and BCG vaccination of certain groups of persons. In discussing this law, the *Lancet* makes the following statement

> this radical measure encountered hardly any opposition, because in the past twenty years tens of thousands of people (in a nation numbering only three million) had had direct experience of BCG, because the doctors, tuberculosis specialists in particular, were in favour of it, and because the Norwegian department for social affairs (corresponding in some respects to our Ministry of Health) had prepared a comprehensive memorandum as a guide to the legislators This memorandum recalled that in March, 1946, the head of the Norwegian army medical service pointed out that

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Public Health Hygiene and Sanitation May 19 1948.

Of all the means at our disposal for the treatment of whooping cough, we believe that the use of oxygen is the most effective agent It is of value in infants with extensive pulmonic involvement and also in children who have severe frequent exhausting paroxysms without extensive pulmonary involvement. It is of great value also in children who are having frequent convulsions Human hyperimmune serum, we felt, was of great value in the treatment of severe whooping cough However, it had no effect on the finding of H pertussis in the nasopharynx

Up to the present, streptomycin has been administered to about 160 patients at the Willard Parker Hospital The initial plan was to rotate the method of administration, by (1) intranasal drops, (2) aerosol, (3) intramuscular injection, and (4) no streptomycin In the dosage used by us we felt that the intranasal method had very little therapeutic value The aerosol and intramuscular injection, on the other hand, seemed to have some therapeutic value In severely ill children we were forced to break this pattern and administer streptomycin by aerosol and intramuscular injection In a few patients human hyperimmune serum was also given For some complications sulfonamides and penicillin were used

Last winter we gave much larger doses and in the infants combined the aerosol and intramuscular injections In the older children we used aerosol alone, and, whenever possible, the nebulizer was put directly into the child's mouth With the above technic we feel that we have influenced the course of the whooping cough In a number of instances we have been able to have controls in members of several families In the treated child the paroxysms often became decidedly less prolonged and less frequent within three days There was no improvement in the condition of the child serving as a control until treatment was begun several days later

When the smaller dosage of streptomycin was used, there seemed to be little effect on the nasopharyngeal cultures However, in the group treated this winter we have gotten many more negative cultures after completion of treatment

OVERWEIGHT INCREASES INCIDENCE OF DISEASE

Overweight is a serious menace to health because it appears to increase the incidence of many diseases, according to three Rochester, Minnesota, researchers

Writing in the January 8 issue of the *Journal of the American Medical Association*, Clifford F Gastineau, M D , of the Mayo Foundation, and Edward H. Rynearson, M.D , and Alice Karslake Irmisch, M S , of the Mayo Clinic, say that between the ages of 45 and 50 years, 25 pounds of excess weight results in an increase of 25 per cent in mortality

"Greater degrees of overweight are a correspondingly greater hazard to life and health," they point out. "Overweight has been found to be associated with an increased incidence of high blood pressure, diabetes, cancer, heart disease, kidney disease, hardening of the arteries, liver disease, and varicose veins"

Emotions, training and habit "exert a considerable influence" in determining whether people overeat or undereat, they say, adding "Investigations of the lean and fat by a number of psychiatrists have suggested a strikingly high incidence of psychologic aberrations The apparently increased incidence of neuroses in association with obesity or leanness may be open to some question, since most such investigations have not included psychiatric studies of persons of normal weight for control purposes.

"Glandular disorders are rarely a cause of either pronounced obesity or leanness. It is difficult to hazard a guess whether inheritance or environment exerts the greater influence on eating habits. If mother prides herself on setting a good table, if dad eats heartily and with obvious enjoyment, if the household attitude and feeling is that good food in generous quantities is the end and purpose of life, it is not surprising that an entire family may become obese without the mediation of heredity Imitation of elders and attitudes acquired in childhood may govern eating habits in later life"

In general, the best way to get rid of excess weight is to eat less, the researchers indicate Several medicines which have been used for reducing accomplish little, and massage, local applications of heat, and exercise have no effect on local deposits of fat they say

Among the controls, 53 died from tuberculosis—a rate of 3 5 per 1,000 person-years, 56 died from other causes—a rate of 3 7 per 1,000 person-years" And Aronson concludes that "This controlled study indicates that the use of BCG vaccine is a safe and practical procedure and that it has significantly reduced the mortality from tuberculosis in a highly infected population during the nine to eleven year period of observation "[10]

The most extensive and carefully controlled BCG study in infants is that of Rosenthal and coworkers in Chicago, among a low-income group in which there was a relatively high degree of exposure to tuberculosis [11] The infants were largely those delivered at the Cook County Hospital, and the multiple puncture method of vaccination was employed during the first few days of life If there was a case of open tuberculosis in another member of the child's household, the infant was isolated at the hospital for six to twelve weeks before being returned home Infants in the control group series, subject to such exposure, were similarly isolated The results of the first seven years observation were reported in 1945 and brought up to date in January this year Of the children not directly exposed to tuberculosis in the household, 11 cases of demonstrable tuberculosis occurred in 1,417 vaccinated in comparison with 39 cases among the 1,414 controls There was one death from tuberculosis in the vaccinated groups and seven deaths in the control groups Of children directly exposed to tuberculosis in their households there were two cases, with no deaths in 151 vaccinated in comparison with five cases and four deaths in 105 controls, giving morbidity rates of 3 86 per 1,000 person-years in the vaccinated and 17 60 in the controls As the control groups in this study were adequately followed up and equalized with the vaccinated groups, in every possible respect, the figures must be regarded as highly significant

These observations and the result of vaccination under war conditions in Scandinavian countries produced a most favorable impression in this country Professor Kai Jensen, of Copenhagen, visited in New York in the spring of 1946, and his records were thoroughly discussed by the staff of the State Department of Health In July the Division of Laboratories and Research was authorized to undertake the preparation of vaccine and in October, I joined the Division and organized a laboratory for that purpose Dr Edward S Godfrey, Jr, then New York State Commissioner of Health, held a conference the same month in which the Department's program was formulated The Department's judgment proved to be quite similar to that of the conference held in Washington the previous month under the auspices of the United States Public Health Service The conference recommended extensive study before general use or commercial manufacture The federal and New York programs are quite similar and should helpfully supplement each other Since the federal program had been planned by Dr Herman E Hilleboe, then Assistant Surgeon General and now New York State Commissioner of Health, the further correlation of the two studies is assured

On January 8, 1947, the Subcommittee on Child Welfare of the Medical Society of the State of New York discussed the use of the BCG vaccine in New York State as a part of the Tuberculosis Control Program This Committee was of the opinion that an educational program should be inaugurated to inform the medical profession of this State about BCG immunization.

The Committee on Public Health and Education, with the Committee on Child Welfare, and representatives of the New York State Department of Health, met with representatives of the nine medical schools of New York State in New York City on February 12, 1947 After a thorough discussion of BCG immunization, it was recommended that an advisory committee be appointed by the New York State Department of Health and the State Medical Society to work out a plan whereby instruction would be available for those who are to be in charge of BCG immunization programs, as well as for county medical societies, hospital staffs, and other medical groups

On March 12, 1947, the BCG Advisory Committee held its first meeting in New York City Preliminary plans were drawn up for the distribution and use of the vaccine It was decided that, for the present, only a limited number of physicians should be allowed to use the vaccine and only in selected groups of tuberculin-negative persons who work or reside in an environment where they are intimately exposed to tuberculous infection, such as nurses, medical students, hospital and sanatoria personnel, etc

Since the first Washington conference on BCG vaccination in September, 1946, the interest in immunization against tuberculosis had steadily grown "So great, indeed, had been the demand from every quarter," according to Francis J Weber, Medical Director, Chief, Tuberculosis Control Division of the United States Public Health Service, "for additional information concerning the course of BCG investigations that an evaluation and review of recent work in the field had become increasingly appropriate To that end, a second conference convened in New York City on March 9 1948," which was attended by a

about half the men called to the colours were tuberculin-negative, and that B C G immunisation could not be satisfactorily achieved on a purely voluntary basis In the following September a committee of experts reported that compulsory B C G immunisation was desirable (1) for all persons in a tuberculous environment, (2) for doctors, nurses, hospital workers, and other groups with a high tuberculosis morbidity, (3) for men liable for military service, and (4) for youngsters at the school-leaving age, students and others Soon afterwards the Norwegian Tuberculosis Doctors' Association unanimously passed a resolution in its favour

In a commentary on the various paragraphs of the Bill now enacted the department for social affairs says that, though in the world at large the number of persons inoculated against tuberculosis now runs into millions, no case of tuberculosis has so far been traced to B C G The Oslo public-health service has found that the positive tuberculin reaction achieved with B C G immunisation is nearly always present five to six years later On the west coast of Norway, where opposition to vaccination against smallpox is common, there is no such opposition to vaccination against tuberculosis In several towns where B C G vaccination has been provided for those of school-leaving age, the percentage voluntarily accepting the offer has ranged from 50 to 90 It is calculated that if no compulsion is used the immunisation of all who need it will take too long, but on the other hand compulsory immunisation must be confined at present to the groups requiring it most, for the people who can undertake it are not unlimited [6]

A noticeable change in favor of BCG vaccination is taking place in Soviet Russia, where every infant is being immunized at birth, in South America, Mexico, Australia, New Zealand, Japan, China, India, and the Near East, where extensive immunization programs are being planned The most gigantic BCG program is being carried out today by the World Health Organization in war-stricken countries of Europe, under the auspices of the Danish Red Cross, with the active support of the Danish Public Health Service and of the State Serum Institute in Copenhagen The sum of nearly one million dollars has been earmarked by the Danish Red Cross and two million dollars by the World Health Organization for BCG vaccination in Poland, Jugoslavia, Hungary, Austria, and the American and British zones in Germany About sixty doctors trained in BCG vaccination and twice that number of nurses are planning to test about 50 million persons with tuberculin and to vaccinate about 15 million tuberculin-negative persons during 1948 and 1949 Three aeroplanes have been purchased for the supply of fresh vaccine at short intervals to the various centers in which the teams happen to be working Since practically everyone over twenty-five years of age in these countries is tuberculin-positive, BCG vaccination becomes limited to persons under that age [7]

New Developments in BCG Vaccination in America

What then is the American attitude toward BCG vaccination today? The need for adequately controlled BCG studies in man has been fully appreciated in this country Fortunately, a few such long-term, controlled investigations have now progressed to a point which permits some definite conclusions to be drawn

Baudouin reported a study based on BCG vaccination of more than 20,000 infants in Canada [8] Restricting his report to children who were exposed to open cases of tuberculosis in their homes, he found that the morbidity from tuberculosis in 793 vaccinated cases was about 70 per cent less and the mortality 47 per cent less than in 1,239 controls In his series the resistance seemed to be maintained throughout the period of seven years observation

Aronson and Palmer reported an extensive BCG study in Indians from one to twenty years of age living on four reservations in the United States and in twelve communities in Alaska [9] The economic level of the group was low, and there was a high degree of exposure to tuberculosis There were 1,550 vaccinated individuals and a satisfactory control group of 1,457 with negative tuberculin reactions who were not vaccinated These were followed for six years or more by means of repeated physical examinations, chest x-rays, and tuberculin tests The tuberculosis mortality rate was four among the vaccinated, all starting during the first two years after vaccination, as compared with 28 among the controls, which were fairly evenly distributed over the six-year observation period. The number of manifest tuberculous was 40 among the vaccinated, or 4.7 per 1,000 person-years, and 185, or 24 3 per 1,000 person-years in the controls The latter were evenly distributed over the six-year period, but the rate among the vaccinated fell progressively from 11 8 during the first year to less than 1 per 1,000 person-years during the sixth year This suggested that the degree of protection increased rather than decreased during this period under the conditions obtaining in this group As late as May 16, 1948, Aronson reported before the Fourth International Congresses on Tropical Medicine in Washington, D C, that the vaccinated group has now been "observed for a total of 16,406 person-years, the control group for a total of 15,207 person-years During this time six persons among the vaccinated died from tuberculosis, a rate of 0 4 per 1,000 person-years. Deaths from other causes were 49—a rate of 3 0 per 1,000 person-years

it is recommended that the intracutaneous method be used. Comparable doses of O T for the two-test procedure are 0 01 mg O T for the first test dose and 0 1 mg for the second dose When a single test of O T is used, the dosage recommended is 0 1 mg of O T Interpretations should be made in the same manner as with P P D

2 Take chest x-ray of the non-reactors before vaccination, whenever practicable

3 Give BCG vaccine only to non-reactors Vaccination should be performed within two weeks of the tuberculin test

4. Test vaccinated group with tuberculin eight to ten weeks after vaccination If P P D was used before vaccination, use 0 0002 mg P P D for this retesting If O T was used before vaccination, use 0 1 mg O T for the retesting

5 Revaccinate those previously vaccinated who remain non-reactors to tuberculin upon retesting

6 Whenever possible, all persons comprising the initial group, including the initial prevaccination reactors as well as the initial non-reactors should be observed for as long a period of time as possible, and preferably for at least five to ten years, with semiannual chest x-ray examinations and annual tuberculin tests By repeating tuberculin tests at yearly intervals, those who revert from positive to negative can be identified

7 Revaccinate those reverting to tuberculin-negative status following vaccination

Consultation and advisory service by the State Department of Health, including assistance in planning a local program, will be available and may be requested at any time Arrangements may be made for instruction and demonstration in vaccination procedures Requests for such service or information should be made to the Division of Tuberculosis Control, 28 Howard Street, Albany 7, New York

It should be noted that the BCG program for the State of New York makes no provision for a control nonvaccinated group The Division of Tuberculosis Control is planning, however, a systematic, annual follow-up examination of the vaccinated persons with tuberculin tests and chest x rays, for the purpose of evaluating the influence of BCG immunization on tuberculosis morbidity and mortality rates in groups of intimately exposed persons

BCG vaccination of tuberculin negative nurses and medical students is now a regular practice in seven of the State's nine medical schools A dozen nurses' training schools and teaching hospitals as well as several tuberculosis hospitals and clinics have likewise entered upon the systematic BCG immunization of tuberculin negative nurses, doctors, and employees Vaccination programs have also been launched in some of the State's mental hospitals and plans are being formulated for BCG immunization work among the tuberculin-negative population in Harlem where the current tuberculosis mortality rate is more than eight times that among the white population in New York City

The New York State BCG Program may seem a very modest endeavor in comparison with the extensive vaccination work carried out in the Scandinavian countries and more so in view of the gigantic immunization program, entered upon by the World Health Organization, of more than one million vaccinations per month in Poland, Jugoslavia, Hungary, Austria, and the American and British zones in Germany However, if the preliminary conclusions of the BCG Advisory Committee for the State of New York become confirmed by the work now in progress, we may hope that the vaccine will soon be available for use on a more extensive scale

Conclusion

The New York State Department of Health and the Medical Society of the State of New York recommend that BCG immunization be used extensively in tuberculin negative reactors in groups of occupationally exposed persons, such as nurses, medical students, and hospital personnel, in population groups with high tuberculosis morbidity and mortality, and where there has been a known exposure to tuberculosis or where an exposure is likely to occur, as in the households of patients returning home from hospitals or sanatoria For the present, the vaccine will not be distributed generally

Discussion

Arthur B Robins, M D, *New York City*—I shall confine my discussion to three aspects of the subject presented which are of special public health significance at this time, case-finding, BCG, and streptomycin

One plan for tuberculosis case-finding currently proposed is the community-wide survey as demonstrated so brilliantly by the United States Public Health Service in Milwaukee, Minneapolis, St Paul, and now in Washington, D C This is not feasible in New York City at this time There are more than 6,000,000 individuals over fifteen years of age in this City Even if we assume that 100,000 persons can be x-rayed by each survey unit annually a minimum of 60 such units would be required to cover the adult population in New York City in the course of a year In our experience, approximately 5 per cent of those x-rayed require further study This would call for the re-examination of over 300,000 persons If the tuberculosis prevalence rate of 2 per cent found in the 160,000 x-ray examinations done in 1947 is applied to the entire adult population, continued supervision would be required for at least 100 000 cases of tuberculosis This exceeds the total number of individuals examined in our chest clinics last year The usual finding of only one to two active cases of pulmonary tuberculosis in each

larger group of specialists than had met in 1946 to formulate the original policy [12] The majority of the Conference favored the use of BCG among restricted categories of people which permitted long-term follow-up studies to determine the best methods of administering the vaccine, the duration of tuberculin hypersensitiveness produced by vaccination, and the protective value against tuberculous disease In order to obtain more accurate knowledge than is now available concerning the vaccine, the Conference felt that the Public Health Service should assist State, local, and other official agencies with vaccination centers necessary for this activity and should also make provision for the eventual participation of the private physician Such selective vaccination programs should be promoted among contacts of open cases, medical and nursing personnel, hospital, sanatorium, and laboratory employes, inmates of penal and mental institutions The Conference also recommended the development of controlled BCG studies with State, territorial, and local health agencies, in good-sized population groups where the prevalence of tuberculosis is great, such as in the North American Indian population, parts of Alaska, Puerto Rico, Hawaii, and the Philippines, and segments of our great cities Finally, it was also recommended to assist State and local health departments in the development of large-scale trial of the value of BCG vaccination in the general population in a number of metropolitan areas and, whenever possible, in conjunction with community x-ray surveys These recommendations mark a definite advance from the position taken by the first Washington conference This wider application of vaccination represents a compromise between the two extreme trends of thought expressed by minority groups, favoring either a general use of BCG in the United States or no use of the vaccine except in controlled research studies

By April 26, 1948, the BCG program for the State of New York had advanced to the stage of official rules being promulgated by the Commissioner of Health, Dr Herman E Hilleboe, pursuant to Article XVI, Section 311-a of the Public Health Law, on "Vaccine and Vaccination against Tuberculosis" [13] This was followed by the issuance on May 7, 1948, of a booklet, *BCG Vaccination*, by New York State Department of Health and the Medical Society of the State of New York This publication sets forth the official BCG vaccination program for the State The first part of the booklet deals with the administrative aspects of the program, and the second part is a technical guide for physicians

The opening paragraph reads as follows

> BCG vaccination is one of the known methods of reducing morbidity and mortality from tuberculosis, and at present is the only known practical method of inducing specific resistance to tuberculosis There is general agreement on two points (*a*) it is safe, (*b*) it serves to convert non-reactors to tuberculin to reactors through infection with avirulent and *benign bovine* tubercle bacilli There is sufficient evidence of the effectiveness of BCG to warrant its use in selected population groups in which the infection rate is high Persons who do not react to tuberculin in such groups might otherwise be first infected with virulent organisms BCG vaccine is not to be administered indiscriminately, because it can be of benefit only to those persons who have NOT been infected by the tubercle bacillus It must be emphasized that BCG vaccine has NO value in the treatment of tuberculous disease

The vaccine is recommended for use in selected groups as follows

> Tuberculin negative persons (*a*) in groups occupationally exposed, such as nurses, medical students and hospital personnel, (*b*) in population groups with high tuberculosis morbidity and mortality rates, and (*c*) where there has been a known exposure to tuberculosis or where an exposure is likely to occur, as in the households of patients returning from hospitals or sanatoria
>
> Local full-time health departments should be in a position to judge the need for and the timeliness of a BCG program in their respective localities The details of the program are to be carried out by local personnel and facilities Other local agencies which will participate in this program are medical schools, nurses' training schools, general hospitals, hospitals for the tuberculous, and tuberculosis clinics
>
> For the present, BCG vaccine will be distributed on request to (1) local full-time health departments, (2) medical colleges and teaching hospitals, (3) superintendents of public tuberculosis hospitals and directors of tuberculosis clinics, and (4) additional hospitals and institutions with specially trained physicians who have been designated by the State Commissioner of Health to administer BCG vaccine

The procedures recommended are as follows

> 1 Tuberculin test the entire group Use purified protein derivative intracutaneously In groups in which there has been a known unduly high exposure to tuberculosis it is preferable to use two test doses of P P D 0 00002 mg for the first test dose and 0 0002 mg for the second dose When a single test is used, the dosage recommended is 0 0002 mg of P P D Interpretations of the tests should be made at forty-eight to seventy-two hours, preferably the latter A reaction to tuberculin should not be interpreted unless there is definite induration or edema of at least 6 to 8 mm diameter, regardless of whether redness is present or not If old tuberculin is used,

ABDOMINAL SURGERY IN INFANCY AND CHILDHOOD

EDWARD J DONOVAN, M D , New York City

(From the Department of Clinical Surgery, College of Physicians and Surgeons, Columbia University, and St. Luke's and Babies Hospitals)

THERE are certain qualities necessary in a man who wishes to be successful in the surgery of infants and children. First of all, he must be fond of children, understanding, sympathetic, and most important of all requisites, he must be gentle at all times He must be a keen observer and able to seize his opportunities as they present themselves, since it is often necessary to make the diagnosis not only without the cooperation of the patient but in spite of his opposition. He must not consider an infant or a child as a small edition of an adult, subject to the same diseases as adults and reacting in the same way

While at times almost every adult surgical condition may be found in an infant or a child, the converse does not hold true, as children suffer from several abdominal conditions such as acute mesenteric lymphadenitis, congenital pyloric stenosis, idiopathic intussusception, and certain malignant tumors, such as Wilms' tumor of the kidney, neuroblastoma of the adrenal or sympathetic nerve cells, which have no counterpart in adult life The pathologic process in a child is often exactly the same as that found in adults but is modified by the child's reaction to it. It is for this reason that many diseases of infancy and childhood are abrupt in their onset, intense in their manifestations, and of short duration Children do not suffer from the degenerative diseases of adult life, and their fresh young tissues react most satisfactorily to surgical trauma Their powers of healing are tremendous and through the process of growth and development may overcome great handicaps The best example of this power is the way that an infant will heal a postoperative incisional hernia by growth only, while these hernias in adults always need surgical repair

Another way in which abdominal surgery in infants and children differs from that in adults is the children's reactions to surgical trauma There is a very definite limit to the amount of abdominal surgery that an infant or child can tolerate, yet it has always been amazing to see how much surgery even a very young infant is able to stand if the surgeon remembers that he is operating upon an infant instead of an adult Children do not stand rough handling of their tissues, are very easily disturbed by the loss of blood, and will resist vigorously up to a certain point, but beyond that point the drop may be precipitous and unheralded The surgical attack on the offending organ should be as direct as possible, as there is practically no indication in abdominal surgery of infants and children for the so-called exploratory laparotomy of adult life

It is now generally agreed that any child about to face an operation must be in the best possible condition as far as fluid balance is concerned No longer are the long periods of starvation and purgation before operation considered either necessary or desirable, since it is much more important to increase his fluid intake right up to the time of operation than to remove a quantity of fluid from his gastrointestinal tract by use of purgatives There is no excuse nowadays for operating on any child who is not in fluid balance, as the necessary fluids may easily be supplied in a matter of a few minutes or perhaps an hour Many a successful operation has proved to be a failure because the patient was anemic, dehydrated, or in no condition to stand an operation when the delay of perhaps an hour in replenishing his lost fluids would have assured the successful outcome There is no abdominal condition in an infant or child which is so urgent that the child need be operated on when he is not properly prepared. Clyses or infusions of glucose and saline and transfusions of whole blood or plasma are too easily done to allow any child to be operated on without these benefits No better example of the benefits of proper preparation for operation is needed than the present low mortality in the surgical treatment of pyloric stenosis In the days when these babies were operated on as emergencies and when the medical profession did not appreciate the importance of fluid balance, the mortality was as high as 35 per cent As soon as it was found that these babies needed to have their lost fluids restored more than an emergency operation, the mortality began to drop and continued to do so until it has now reached the level of 1 per cent.

It has also been stated, and I believe quite without justification, that diagnosis of abdominal conditions in infants and children is more difficult than in adults This I believe depends almost entirely upon the examiner's approach to his problem The sick child, particularly if he has a painful lesion in his abdomen, considers every stranger who approaches his bed as an enemy who is only going to add to his discomfort If the proper approach is made—and this means being

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Pediatrics May 20 1948.

thousand persons examined would hardly seem to justify the expenditure of time and money involved, even if the facilities needed for a project of this magnitude were available

A more practicable approach is the x-ray examination of selected groups, the groups in which the bulk of the 3,100 deaths and 7,600 new cases of tuberculosis last year occurred Concentration of our efforts in these groups should lead to finding a larger number of active cases of the disease and finding them earlier Analysis of the data for 1947 indicates that approximately 70 per cent of all male deaths from tuberculosis occurred in men over forty-five and predominantly in white males in poor economic circumstances Almost the same proportion of female deaths occurred in women under forty-five The nonwhite population contributed 30 per cent of all deaths, and these were mostly in younger persons The distribution of new cases by age, sex, and race presented a similar picture

Case-finding among these persons can be done in several ways The x-raying of all hospital admissions is highly productive and should become a routine hospital procedure Recent studies show that a significantly higher proportion of active tuberculosis is found among patients consulting private physicians for a multiplicity of complaints than in the so-called apparently healthy population Routine screening of all private patients by fluoroscopy or x-ray is indicated The entire mass x-ray survey program should be directed more selectively at older white males and younger females, particularly in the nonwhite population Women attending prenatal clinics, domestics, and people receiving public assistance should be x-rayed almost routinely Such a program can and should be continuous, and the services of the Department of Health are freely available for this purpose

The problem of the use of BCG in New York City rests on practical rather than theoretic grounds The mortality from tuberculosis in childhood has been reduced to so low a level that the need for BCG must be doubted In fact, it is only when the twenty to twenty-four-year age group is reached that the number of tuberculosis deaths becomes sufficiently great to justify considering the administration of BCG to the large number of individuals involved This is the group in which least is known about the effect of the vaccine and the duration of the immunity it produces Until these questions have been answered, the routine administration of BCG to adolescents and young adults in New York City would seem to be premature Such investigations are under consideration by the Health Department

Just a few words about streptomycin In the enthusiasm over the first effective antibiotic against the tubercle bacillus, the fact that the case must be found before it can be treated must not be overlooked The earlier it is found, the greater is the likelihood that streptomycin will control the infection Streptomycin offers the strongest justification for the expansion of our efforts to find early cases of tuberculosis On the other hand, the injudicious use of the drug may not only do the patient no good but may even deprive some unfortunate contact of his best chance of getting well. This very real danger places the public health responsibility for the use of streptomycin squarely on the shoulders of the clinician

OSTEOPATHS LOSE KANSAS CASE

The three-judge Federal court convened at the request of four Kansas osteopaths, in a unanimous decision November 16, 1948, upheld the constitutionality of the Kansas osteopathic act In doing so, the court gave full recognition to the right of the state to confine osteopaths to manipulative therapy and to deny to them the right to "use or administer medicinal therapeutics or operative surgery with instruments" The court pointed out that, prior to and since the enactment of the osteopathic act in 1913, "the science of osteopathy has been and is now based upon the concept that the curative powers for bodily disease, infirmity or disability are within the body itself, and, if the structural integrity of the body is maintained, the natural cures will combat the disability, that the art and science of osteopathy lies in detecting and correcting structural derangements in the body by manipulative therapy"

In Kansas, the court said, "the osteopathic profession is classified and regulated as a drugless and knifeless healing art or science" An appeal from this decision may be taken direct to the United States Supreme Court.—*J A M A, November 14, 1948*

ABDOMINAL SURGERY IN INFANCY AND CHILDHOOD

EDWARD J DONOVAN, M D , New York City

(From the Department of Clinical Surgery, College of Physicians and Surgeons, Columbia University, and St Luke's and Babies Hospitals)

THERE are certain qualities necessary in a man who wishes to be successful in the surgery of infants and children First of all, he must be fond of children, understanding, sympathetic, and most important of all requisites, he must be gentle at all times He must be a keen observer and able to seize his opportunities as they present themselves, since it is often necessary to make the diagnosis not only without the cooperation of the patient but in spite of his opposition. He must not consider an infant or a child as a small edition of an adult, subject to the same diseases as adults and reacting in the same way

While at times almost every adult surgical condition may be found in an infant or a child, the converse does not hold true, as children suffer from several abdominal conditions such as acute mesenteric lymphadenitis, congenital pyloric stenosis, idiopathic intussusception, and certain malignant tumors, such as Wilms' tumor of the kidney, neuroblastoma of the adrenal or sympathetic nerve cells, which have no counterpart in adult life The pathologic process in a child is often exactly the same as that found in adults but is modified by the child's reaction to it. It is for this reason that many diseases of infancy and childhood are abrupt in their onset, intense in their manifestations, and of short duration Children do not suffer from the degenerative diseases of adult life, and their fresh young tissues react most satisfactorily to surgical trauma Their powers of healing are tremendous and through the process of growth and development may overcome great handicaps The best example of this power is the way that an infant will heal a postoperative incisional hernia by growth only, while these hernias in adults always need surgical repair

Another way in which abdominal surgery in infants and children differs from that in adults is the children's reactions to surgical trauma There is a very definite limit to the amount of abdominal surgery that an infant or child can tolerate, yet it has always been amazing to see how much surgery even a very young infant is able to stand if the surgeon remembers that he is operating upon an infant instead of an adult Children do not stand rough handling of their tissues, are very easily disturbed by the loss of blood, and will resist vigorously up to a certain point, but beyond that point the drop may be precipitous and unheralded The surgical attack on the offending organ should be as direct as possible, as there is practically no indication in abdominal surgery of infants and children for the so-called exploratory laparotomy of adult life

It is now generally agreed that any child about to face an operation must be in the best possible condition as far as fluid balance is concerned No longer are the long periods of starvation and purgation before operation considered either necessary or desirable, since it is much more important to increase his fluid intake right up to the time of operation than to remove a quantity of fluid from his gastrointestinal tract by use of purgatives There is no excuse nowadays for operating on any child who is not in fluid balance, as the necessary fluids may easily be supplied in a matter of a few minutes or perhaps an hour Many a successful operation has proved to be a failure because the patient was anemic, dehydrated, or in no condition to stand an operation when the delay of perhaps an hour in replenishing his lost fluids would have assured the successful outcome There is no abdominal condition in an infant or child which is so urgent that the child need be operated on when he is not properly prepared. Clyses or infusions of glucose and saline and transfusions of whole blood or plasma are too easily done to allow any child to be operated on without these benefits No better example of the benefits of proper preparation for operation is needed than the present low mortality in the surgical treatment of pyloric stenosis In the days when these babies were operated on as emergencies and when the medical profession did not appreciate the importance of fluid balance, the mortality was as high as 35 per cent As soon as it was found that these babies needed to have their lost fluids restored more than an emergency operation, the mortality began to drop and continued to do so until it has now reached the level of 1 per cent

It has also been stated, and I believe quite without justification, that diagnosis of abdominal conditions in infants and children is more difficult than in adults This I believe depends almost entirely upon the examiner's approach to his problem The sick child, particularly if he has a painful lesion in his abdomen, considers every stranger who approaches his bed as an enemy who is only going to add to his discomfort. If the proper approach is made—and this means being

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Pediatrics May 20 1948.

friendly and kind, restoring the child's confidence in you, and making him think that you are his best friend—he will allow you to do many things, such as a rectal examination which is painful and adds greatly to his discomfort, while someone else in attempting to accomplish these things in a different way will be wholly unsuccessful For example, if the child is suspected of having an acute appendix, do not start your abdominal examination by palpating his right lower quadrant Start on the left side and work around gently to the right lower quadrant If you start by hurting him, you are almost surely doomed to fail Symptoms alone may make a diagnosis in an adult, but this is not true for a child A very careful and thorough abdominal and rectal examination is essential in all abdominal surgical conditions

The actual operation should be done as quickly as is consistent with careful handling of tissues and complete hemostasis, but speed must never be attained by hurried, careless work Each structure should be seen rather than felt and intra-abdominal manipulation should be kept at a minimum Because of their thin abdominal walls, infants and children are much more apt to disrupt their abdominal incisions than adults Disruption of a surgical wound is a serious complication, because it practically always means a second anesthetic, often in a very critical period of the child's convalescence and perhaps before he has fully recovered from the first anesthetic For this reason, great care must be given to the layer closure of all abdominal incisions It is also an excellent plan to use retention sutures of silk on all abdominal incisions, except perhaps on the McBurney incision

The child's postoperative reaction to an abdominal operation is, for the most part, most gratifying Postoperative respiratory infections and atelectasis occur very rarely Children never have to be catheterized nor do they require cathartics after operation They are usually ready and eager to take the nourishment that they require and need not be urged to move around the bed or sit in the chair when the proper time comes They are also very tolerant of such things as infusions, Miller Abbott tubes, etc, far more so than many adults

The greater part of the abdominal surgery of the first year of life is the direct result of some congenital anomaly Infection, therefore, plays a minor role in the abdominal surgery of this period, but, after the child is a year old, infection forms the background of many abdominal pathologic processes as it does in adult life The genitourinary tract is probably the most common site for congenital anomalies, but the gastrointestinal tract is not far behind and it is the latter anomalies which concern us most today It is impossible in a paper of this kind to cove all of the abdominal surgical conditions in in fants and children, so that I am going to discus the congenital anomalies of the gastrointesti nal tract, attempting to accentuate the most im portant points in the diagnosis and treatment o these conditions

One of the first of the congenital anomalies o the gastrointestinal tract is congenital atresia o the esophagus It is considered first because it is found at the upper end of the gastrointestinal tract and also because it makes its presence known but a few hours after the child is born This anomaly exists in four different types, but one type is by far the most common, occurring in at least 85 per cent of the cases, and is the only one we need to discuss today This anomaly consists of a closed upper esophageal pouch, completely separated from the lower esophageal segment which communicates with the trachea at or just above the bifurcation One may suspect the presence of this anomaly if the newborn baby seems to have an unusual amount of saliva or mucus in his mouth and pharynx Your suspicion may then be confirmed by passing a catheter, about size 16 F, down the esophagus and encountering a complete obstruction about 12 cm from the anterior alveolar arch Your suspicions of the presence of the anomaly should be increased if, in addition to the presence of the abnormal amount of secretions in the mouth and pharynx, the baby exhibits severe distress with the very first drink of water he is allowed by mouth He regurgitates it through his mouth and nose immediately, becomes cyanotic, and has quite a serious time as the result of taking the fluid Further confirmation may be obtained by injecting a small quantity of lipiodol (never barium) into this catheter and taking an x ray Barium should not be used for this x-ray, as the baby will aspirate it into his trachea and it will spread through his bronchial tree Lipiodol under these circumstances is quite harmless If the lower esophageal pouch communicates with the trachea, as it usually does, the same x-ray plate will show a normal amount of air or gas in the stomach and intestines This baby should be operated upon as quickly as possible, for he will have an aspiration pneumonia in a matter of three or four days The reason for this is that there is always a great amount of secretion and mucus in the closed upper pouch which he will regurgitate and then aspirate into his trachea and bronchi The ideal operation is to disconnect the fistula from the trachea and do an end-to-end anastomosis between the two esophageal segments Unfortunately, this is not always possible because of the distance between the two seg-

ments or because of the great disparity in the size of their lumens If the ideal operation cannot be done, the upper pouch must be brought out in the neck with the hope of later establishing an external esophagus Great progress has been made in the past ten years in the surgical treatment of this anomaly and, as surgeons' experience increases, many more end-to-end anastomoses will be accomplished

Another early congenital anomaly which needs surgical repair early in life is hernia into the umbilical cord This condition is present at birth and should be corrected as quickly as possible, because the sac of the hernia, which is made up of amnion and peritoneum, is so thin that if allowed to dry it will crack and permit infection to pass from the outside to the peritoneal cavity This condition is usually easily corrected by excising the sac and closing the defect in the abdominal wall with through-and-through silk sutures

Passing down the gastrointestinal tract, the next congenital anomaly that is encountered is pyloric stenosis This condition is caused by hypertrophy of the circular muscle of the pylorus which oftentimes is five or six times its normal thickness, while all other structures at the pylorus are normal. This condition occurs about seven times more often in males than in females and very frequently in the first child of a family Vomiting, which is always the first symptom, usually does not begin until the baby is two weeks old The vomiting, which is a regurgitation at first, soon becomes projectile in character The vomitus never contains bile, which is a very important differential point between pyloric stenosis and congenital duodenal obstruction The vomitus may contain bright red blood or coffee-ground material which is due to the rupture of a gastric mucosal vessel during the forceful vomiting or to the associated gastritis which is present in a large majority of the cases The diagnosis of pyloric stenosis is made by palpating the pyloric tumor which is present in every true case of pyloric stenosis and is pathognomonic since it is found in no other condition These babies soon become dehydrated, lose weight rapidly, and become constipated because they are losing all of their fluid by vomiting They should all be operated on as soon as the pyloric tumor is palpated and the fluids that they have lost by vomiting have been completely restored.

They should never be considered emergencies, as there is really no hurry about operating on them, and they should never be operated on until the tumor is palpated and until they are completely hydrated The Fredet-Rammstedt operation is successful in all cases and gives a permanent result as shown by the follow-up of cases that has extended over the years The mortality should not be greater than 1 per cent

Congenital duodenal obstruction may be divided into two groups depending on whether the obstructing lesion is intra- or extraluminal The common causes of both groups are as follows

Extrinsic Causes	Intrinsic Causes
1 Developmental bands	1 Atresia
2 Volvulus of the mid-gut loop	2 Stenosis
3 Fixation of the duodenum in an abnormal position	3 Intraluminal diaphragm or membrane

There is quite a difference in the clinical behavior of the two groups, as the extrinsic lesions are apt to start as incomplete obstructions which may become complete, perhaps while you have the baby in the hospital for observation These lesions do not always require immediate attention directly after birth as an intrinsic lesion often will, because the latter usually caused complete obstruction and calls for a major surgical operation when the baby is but a few hours old Success with this type of surgery depends, to a large extent, on how quickly the diagnosis is made and the thoroughness of the preparation before operation The diagnosis of any type of duodenal obstruction is suspected if the baby vomits bile A plain plate of the abdomen usually discloses the enlarged duodenum distended with gas, with no gas shadow beyond it if the obstruction is complete Anastomosis of the jejunum to the dilated duodenum either in front of or behind the transverse colon is the operation of choice

There are many causes of congenital obstruction of the small or large bowel in newborn infants The most common causes are atresia, developmental bands, various forms of malrotation, and meconium ileus The diagnosis of intestinal obstruction may easily be made with the help of a plain plate of the abdomen and the obstruction located either in the small or large bowel by this means, but it is impossible to determine the cause of the obstruction until laparotomy is done It is wise to be careful of the use of barium mixtures in making the diagnosis of intestinal obstruction, as you may convert an incomplete obstruction into a complete one by so doing All of the information necessary may be obtained by a plain plate of the abdomen. All cases of intestinal obstruction in the newborn should be operated upon immediately, as sometimes the delay of an hour or two may make a great difference in the outcome of the operation.

Every patient with congenital atresia of the bile ducts should be operated upon in the hope that it may be possible through some type of

anastomosis to deliver the bile into the intestinal tract Unfortunately, so little of the extrahepatic duct system is developed that it is impossible to accomplish this in the majority of cases The liver and the extrahepatic ducts go through a very complicated process in their development, so that it is not to be wondered at that these anomalies occur quite frequently The history in almost every case shows the presence of jaundice which appears shortly after birth and persists beyond the period one would expect physiologic jaundice to do The jaundice is accompanied by clay-colored stools in many, but not all, cases Passage of a duodenal tube and no finding of bile in the duodenal drainage is an excellent test The diagnosis actually depends upon the findings of obstructive jaundice by laboratory tests Operation should not be done until the patient is at least six weeks old and has been under careful observation for several days Physiologic jaundice has usually disappeared by the third week of life

Congenital diaphragmatic hernia may exist in one of several forms One of the most common types shows the defect to be in the posterior part of the chest where the embryonal fibers of vertebral and costal origin have failed to fuse This opening is called the foramen of Bochdalek Hernias through the esophageal hiatus are the next most common variety The diagnosis of most congenital hernias may be made by taking a plain plate of the chest This will show the gas bubbles in the chest, collapse of the corresponding lung, and displacement of the heart to the opposite side of the chest Any infant or child who has coils of bowel in the chest should be operated upon as quickly as possible, otherwise he is a candidate for intestinal obstruction, the worst complication that can befall a patient with diaphragmatic hernia It is also important not to delay operation because the abdomen will not develop if all of its contents are in the chest So, by waiting to repair the hernia, the operator may find that the abdomen is too small to contain all of the structures he brings down from the chest We have successfully operated upon several small infants who were in such respiratory distress that they had to be kept in oxygen until they were anesthetized

Meckel's diverticulum is another congenital anomaly whose possible presence in the abdomen must not be forgotten It may be troublesome because when it becomes inflamed the signs are impossible to differentiate from those of acute appendicitis It is, moreover, much more apt to cause intestinal obstruction by becoming wrapped around some loop of intestine, or it may be the cause of intussusception When it contains aberrant gastric mucosa, as it frequently does, a gross abdominal hemorrhage may be th first indication of its presence The treatmen in all cases is to remove the diverticulum

Congenital malformations of the rectum an anus seem to be all too frequent The mos common anomaly in female babies is an abnorma position of the anus, which is located in the pos terior vaginal wall The anus should be re moved and transplanted to its normal position but this operation should not be attempted unti the girl is about ten years old It must be done before menses start, but it should not be done too early in life The transplantation of the rectum anh anus should be preceded by a completely defunctioning transverse colostomy A splendid result may be expected In boys the anus, anal canal, rectosigmoid, or the rectum may be absent The diagnosis of what part of the large bowel is present may usually be made by taking a plain plate of the abdomen If the rectum or sigmoid is absent, a colostomy must be done The large majority of boys with imperforate anus have a congenital communication between the bladder or the posterior urethra and the rectum, and this fistula is usually diagnosed by the spontaneous passage of meconium through the penis or by the passage of urine into the rectum This fistula will require surgical closure, sometime after we have been able to establish continuity of the gastrointestinal tract

Duplication of any part of the gastrointestinal tract may occur in children, but by far the most common site is in the terminal ileum Duplications usually develop from embryonic rests and lie in the mesentery of the bowel they parallel They also have the same blood supply as the viscus they parallel and, for this reason, it is impossible to remove them without compromising the blood supply and the adjacent loop of gut They very frequently do not contain the same type of mucous membrane as the gut whose mesentery they share, and frequently contain gastric mucous membrane which ulcerates and may cause very serious gastrointestinal hemorrhage They usually communicate with the bowel at one end, but frequently they do not do so They do not show in a gastrointestinal x-ray series, so that they are frequently diagnosed by the process of exclusion They should be completely removed with a corresponding length of the gut they parallel

There are many abdominal surgical conditions in infants and children which have no relation to the anomalies, and I would like to call attention to the salient features in the care of some of the more common of these conditions

The earliest and probably the most common surgical emergency in children between the ages of five and eighteen months is idiopathic in-

intussusception. This condition occurs much more frequently in boys than in girls, and often in the healthiest and most vigorous of the male children. The history in almost all cases is the same, i.e., a strong healthy male child between the ages of five and eighteen months gets a very acute abdominal pain for no reason known to the mother. This pain is so acute that he cries out, may become pale and covered with perspiration, and there is no doubt in the mother's mind that something acute has taken place inside his abdomen. He may recover from this initial shock in a few minutes only to have a recurrence of the acute attack later. He soon passes blood or bloody mucus by rectum, but it is well to remember that it is possible for him to pass one or more perfectly normal stools before they show the bloody mucus. With a history such as this, one should suspect the child of having an acute intussusception. The diagnosis is confirmed by palpating an abdominal mass, usually running transversely across the epigastrium. Operation should be done as quickly as it is possible, because every hour of delay may decrease the operative chance of reducing the intussusception. The mortality in the treatment of intussusception may all be attributed to delay in diagnosis or delay in operation.

Acute appendicitis may occur at any age. We have seen several cases in infants less than one year of age. This is another condition where the mortality is almost entirely due either to delay in diagnosis or delay in the operative treatment. No amount of skill on the part of the surgeon may overcome the harm caused by delay as stated above. The diagnosis is probably no more difficult in infants and children than it is in adults. The history in almost every case is that of generalized abdominal pain followed by vomiting. The most reliable of all physical signs is definitely localized tenderness or rebound tenderness over McBurney's point. We prefer to use a McBurney incision on all males and on all females under twelve years of age. After twelve years of age, we prefer to make a right rectus incision in girls. There is no doubt whatever in the surgeon's mind that acute appendicitis is the cause of the trouble. It is very difficult to treat other conditions than acute appendicitis through a McBurney incision.

The care of inguinal and umbilical hernias in infants often causes the attending physician no end of worry. A simple statement of the indications for surgical treatment of this condition may be helpful. Because so many inguinal hernias in infants will heal spontaneously during the first year of life, they are not all considered to be surgical. Many of them will be helped by the use of a truss. In other words, the only indication for the surgical repair of an inguinal hernia in an infant under one year of age is that the hernia is troublesome, and by that I mean that it is frequently becoming incarcerated, and the physician has to be called to reduce it. After the infant has reached the age of one year, very few inguinal hernias will heal spontaneously, so that they should all be operated upon. The mortality and the recurrence rate in the surgical treatment of inguinal hernias are both zero. Similar conditions and indications apply to umbilical hernias in infants. Many umbilical hernias occur in infants who have rickets, and as the rickets improve and by the process of growth and development of the child, an umbilical hernia may be cured spontaneously up to the age of four years, so that it is our policy not to operate upon umbilical hernia before the child is four years old, unless the hernia becomes repeatedly incarcerated. Very few umbilical hernias will heal spontaneously after the child has reached the age of four years.

Incompletely descended testes should be brought down to the scrotum before puberty, as the testicle undergoes its greatest development at puberty and has a far better chance of becoming a good testicle if it is in the scrotum. The best time for operation is between the ages of eight and twelve years. Since for most incompletely descended testes there is a mechanical reason why they do not descend into the scrotum, I do not believe that many of them are helped in their descent by the use of hormones. Many parents request a trial of hormone treatment, and I see no real reason why it should not be tried if done judiciously.

Infants and children are excellent subjects for carefully planned and skillfully executed abdominal surgical procedures. They will respond most gratifyingly to the careful handling of their tissues and will get well in spite of the greatest odds if they are given a chance.

Discussion

John Aikman, M.D., *Rochester*.—Dr. Donovan's paper shows what may be accomplished by teamwork and by devoting special attention to surgery of children. It is through the work of these children's surgeons that so much has been accomplished.

Dr. Donovan has emphasized the value of x-ray and the diagnosis of gastrointestinal and other abnormalities. I would like to add that more intravenous pyelography will probably bring out the diagnosis of more congenital abnormalities of the urinary tract.

I admire the author's stand on delay of operations on hernias. I have long felt that the general surgeon rushes in on these cases. I am surprised that he does not find that the antibiotics have greatly influenced his results.

anastomosis to deliver the bile into the intestinal tract Unfortunately, so little of the extrahepatic duct system is developed that it is impossible to accomplish this in the majority of cases The liver and the extrahepatic ducts go through a very complicated process in their development, so that it is not to be wondered at that these anomalies occur quite frequently The history in almost every case shows the presence of jaundice which appears shortly after birth and persists beyond the period one would expect physiologic jaundice to do The jaundice is accompanied by clay-colored stools in many, but not all, cases Passage of a duodenal tube and no finding of bile in the duodenal drainage is an excellent test The diagnosis actually depends upon the findings of obstructive jaundice by laboratory tests Operation should not be done until the patient is at least six weeks old and has been under careful observation for several days Physiologic jaundice has usually disappeared by the third week of life

Congenital diaphragmatic hernia may exist in one of several forms One of the most common types shows the defect to be in the posterior part of the chest where the embryonal fibers of vertebral and costal origin have failed to fuse This opening is called the foramen of Bochdalek Hernias through the esophageal hiatus are the next most common variety The diagnosis of most congenital hernias may be made by taking a plain plate of the chest This will show the gas bubbles in the chest, collapse of the corresponding lung, and displacement of the heart to the opposite side of the chest Any infant or child who has coils of bowel in the chest should be operated upon as quickly as possible, otherwise he is a candidate for intestinal obstruction, the worst complication that can befall a patient with diaphragmatic hernia It is also important not to delay operation because the abdomen will not develop if all of its contents are in the chest So, by waiting to repair the hernia, the operator may find that the abdomen is too small to contain all of the structures he brings down from the chest We have successfully operated upon several small infants who were in such respiratory distress that they had to be kept in oxygen until they were anesthetized

Meckel's diverticulum is another congenital anomaly whose possible presence in the abdomen must not be forgotten It may be troublesome because when it becomes inflamed the signs are impossible to differentiate from those of acute appendicitis It is, moreover, much more apt to cause intestinal obstruction by becoming wrapped around some loop of intestine, or it may be the cause of intussusception When it contains aberrant gastric mucosa, as it frequently does, a gross abdominal hemorrhage may be the first indication of its presence The treatment in all cases is to remove the diverticulum

Congenital malformations of the rectum and anus seem to be all too frequent The most common anomaly in female babies is an abnormal position of the anus, which is located in the posterior vaginal wall The anus should be removed and transplanted to its normal position, but this operation should not be attempted until the girl is about ten years old It must be done before menses start, but it should not be done too early in life The transplantation of the rectum anh anus should be preceded by a completely defunctioning transverse colostomy A splendid result may be expected In boys the anus, anal canal, rectosigmoid, or the rectum may be absent The diagnosis of what part of the large bowel is present may usually be made by taking a plain plate of the abdomen If the rectum or sigmoid is absent, a colostomy must be done The large majority of boys with imperforate anus have a congenital communication between the bladder or the posterior urethra and the rectum, and this fistula is usually diagnosed by the spontaneous passage of meconium through the penis or by the passage of urine into the rectum This fistula will require surgical closure, sometime after we have been able to establish continuity of the gastrointestinal tract

Duplication of any part of the gastrointestinal tract may occur in children, but by far the most common site is in the terminal ileum Duplications usually develop from embryonic rests and lie in the mesentery of the bowel they parallel They also have the same blood supply as the viscus they parallel and, for this reason, it is impossible to remove them without compromising the blood supply and the adjacent loop of gut They very frequently do not contain the same type of mucous membrane as the gut whose mesentery they share, and frequently contain gastric mucous membrane which ulcerates and may cause very serious gastrointestinal hemorrhage They usually communicate with the bowel at one end, but frequently they do not do so They do not show in a gastrointestinal x-ray series, so that they are frequently diagnosed by the process of exclusion They should be completely removed with a corresponding length of the gut they parallel

There are many abdominal surgical conditions in infants and children which have no relation to the anomalies, and I would like to call attention to the salient features in the care of some of the more common of these conditions

The earliest and probably the most common surgical emergency in children between the ages of five and eighteen months is idiopathic in-

intussusception This condition occurs much more frequently in boys than in girls, and often in the healthiest and most vigorous of the male children. The history in almost all cases is the same, i.e., a strong healthy male child between the ages of five and eighteen months gets a very acute abdominal pain for no reason known to the mother This pain is so acute that he cries out, may become pale and covered with perspiration, and there is no doubt in the mother's mind that something acute has taken place inside his abdomen. He may recover from this initial shock in a few minutes only to have a recurrence of the acute attack later He soon passes blood or bloody mucus by rectum, but it is well to remember that it is possible for him to pass one or more perfectly normal stools before they show the bloody mucus With a history such as this, one should suspect the child of having an acute intussusception. The diagnosis is confirmed by palpating an abdominal mass, usually running transversely across the epigastrium Operation should be done as quickly as it is possible, because every hour of delay may decrease the operative chance of reducing the intussusception The mortality in the treatment of intussusception may all be attributed to delay in diagnosis or delay in operation

Acute appendicitis may occur at any age. We have seen several cases in infants less than one year of age This is another condition where the mortality is almost entirely due either to delay in diagnosis or delay in the operative treatment No amount of skill on the part of the surgeon may overcome the harm caused by delay as stated above. The diagnosis is probably no more difficult in infants and children than it is in adults The history in almost every case is that of generalized abdominal pain followed by vomiting The most reliable of all physical signs is definitely localized tenderness or rebound tenderness over McBurney's point We prefer to use a McBurney incision on all males and on all females under twelve years of age After twelve years of age, we prefer to make a right rectus incision in girls unless there is no doubt whatever in the surgeon's mind that acute appendicitis is the cause of the trouble It is very difficult to treat other conditions than acute appendicitis through a McBurney incision

The care of inguinal and umbilical hernias in infants often causes the attending physician no cause of worry A simple statement of the indications for surgical treatment of this condition may be helpful Because so many inguinal hernias in infants will heal spontaneously during the first year of life, they are not all considered to be surgical. Many of them will be helped by the use of a truss. In other words, the only indication for the surgical repair of an inguinal hernia in an infant under one year of age is that the hernia is troublesome, and by that I mean that it is frequently becoming incarcerated, and the physician has to be called to reduce it After the infant has reached the age of one year, very few inguinal hernias will heal spontaneously, so that they should all be operated upon The mortality and the recurrence rate in the surgical treatment of inguinal hernias are both zero Similar conditions and indications apply to umbilical hernias in infants Many umbilical hernias occur in infants who have rickets, and as the rickets improve and by the process of growth and development of the child, an umbilical hernia may be cured spontaneously up to the age of four years, so that it is our policy not to operate upon umbilical hernia before the child is four years old, unless the hernia becomes repeatedly incarcerated. Very few umbilical hernias will heal spontaneously after the child has reached the age of four years

Incompletely descended testes should be brought down to the scrotum before puberty, as the testicle undergoes its greatest development at puberty and has a far better chance of becoming a good testicle if it is in the scrotum The best time for operation is between the ages of eight and twelve years Since for most incompletely descended testes there is a mechanical reason why they do not descend into the scrotum, I do not believe that many of them are helped in their descent by the use of hormones Many parents request a trial of hormone treatment, and I see no real reason why it should not be tried if done judiciously

Infants and children are excellent subjects for carefully planned and skillfully executed abdominal surgical procedures They will respond most gratifyingly to the careful handling of their tissues and will get well in spite of the greatest odds if they are given a chance

Discussion

John Aikman, M.D., *Rochester*.—Dr Donovan's paper shows what may be accomplished by teamwork and by devoting special attention to surgery of children It is through the work of these children's surgeons that so much has been accomplished

Dr Donovan has emphasized the value of x-ray and the diagnosis of gastrointestinal and other abnormalities I would like to add that more intravenous pyelography will probably bring out the diagnosis of more congenital abnormalities of the urinary tract

I admire the author's stand on delay of operations on hernias I have long felt that the general surgeon rushes in on these cases I am surprised that he does not find that the antibiotics have greatly influenced his results

R. Franklin Carter, M D , *New York City* —After considerable experience in the management of abdominal conditions in infancy and childhood, the general surgeon will appreciate and understand the importance of the special features in this field as pointed out by the author Certain qualities in the man may be desirable, but certainly the man must realize that the child is not a small edition of the adult in a surgical way before he can become as successful in this field as he may after such a realization Throughout the whole discussion that we have just heard there is evident a profound understanding and appreciation of the importance of these special features

Special conditions encountered in infants and children, as well as the difference in reaction of the child to pathologic conditions seen in adult life, have been pointed out for our guidance The prompt and severe reaction of an infant to conditions common to both infant and adult has often discouraged the pediatrician as well as the surgeon in instituting radical surgical measures

Exploratory laparotomy in childhood is rarely, if *ever, indicated because of subjective symptoms* The severe abdominal symptoms encountered in the adult in association with psychosomatic conditions are not seen in the child Vomiting is at times a very misleading sign in children when it is seen in connection with a behavior problem

The belief that children, and especially infants, could not withstand as much surgery as adults is gradually being dispelled With an equal degree of preparation beforehand and an adequate immediate preparation, such as having an infusion started through a cut-down procedure, and with plenty of blood on hand, any surgical procedure can be planned and carried out on the child to the same extent that it could be in the adult Surgical shock may appear quickly and with little warning in the midst of extensive abdominal operations in children To wait until shock appears before starting an infusion on a child is not so safe as in an adult, this is especially true of infants The child may be so small that actually there is not room, during the operation, for anyone to get near enough to start an infusion Therefore, all infants should have an infusion going through a cut-down cannula in place or a well-secured needle before the abdominal incision is made in cases in which resection of intestine may be necessary

We have all heard the statement that diagnosis of abdominal conditions in children is more difficult than in adults This may be due to the examiner's approach to the problem, but it is also very materially influenced by the examiner having an erroneous opinion on the subject, such as, that acute appendicitis does not occur under a certain age or that children do not have some other conditions, therefore, something common to childhood must be looked for Vomiting in infants is more often caused by incorrect eating than it is in the adult, but it may be the result of organic disease in infancy just as it is in adult life

Wound disruption is, or was, common in infants until we realized that the omentum in very young infants contains little fat It may be caught in t wound closure without being detected In t position, the wound is bathed in peritoneal flu healing is interfered with, and disruption may resu

The surgical conditions encountered during t first year of life make up the most interesting gro of all conditions found in childhood In them have a surgical opportunity to restore the continu of the intestinal tract, relieve obstruction, and move or relieve developmental defects A spec experience in the management of these patients is necessity in order that prompt diagnosis can be ma and proper surgical relief measures instituted knowledge of the most common lesions causing o struction, their most frequent location, and t proper operation to employ is of paramount impo tance to anyone in this field Exploratory lapa otomy and disemboweling the patient to search f the obstructing lesion is a shocking procedure I the presence of an existing shock of intestinal ol struction, the exploration may very well be mo than the infant can stand Therefore, emergency temporary relief measures such as ileostomy or colo tomy become necessary procedures to use instea of removal or proper short circuiting operation Infants tolerate ileostomy poorly Colostomy wi complicate the second operation by its presence i the field An accurate diagnosis as to the site an most probable cause of the obstruction before open ing the abdomen with a direct and prompt exposur of the lesion under local anesthesia will enable th surgeon to perform a permanent or complete opera tion in one stage

The use of the x-ray in patients with suspected obstruction of the gastrointestinal tract in infancy *has been variously advocated It is thought that* partial obstruction may be converted into a complete one by the presence of the barium above the lesion Such a stenosis will ultimately result in obstruction in any event so that, if it be precipitated by the mixture, we feel the information obtained by its use justifies the risk involved in patients with suspected lesions in the stomach or duodenum A preliminary exposure of the abdomen to detect the presence of intestinal gas will prevent the use of a barium mixture in atresia of the esophagus, small intestine, and lower bowel The x-ray will locate the site of the lesion in the duodenum With this information the surgeon can quickly reach the area and determine the cause The barium mixture should be thoroughly washed from the stomach before operation An indwelling catheter in the stomach, after thorough lavage, should be a routine preoperative measure in all patients with obstruction Any patient going to the operation with a dilated stomach is apt to eructate or vomit during the handling of the stomach and thereby inspire gastric content into the bronchi and set up postoperative complications much more serious than the operation itself

Congenital anomalies of the bile ducts present a problem with biliary obstruction that should be diagnosed by the third month of life or earlier The prompt use of all the blood and urine tests together with duodenal drainage will establish the diagnosis early After three months of age the enlarged liver

makes the operation very difficult, liver damage becomes severe, and the ducts above the atresia are found to have become caked with inspissated bile Restoration of bile flow in the presence of liver damage and bile casts may never take place after the obstruction is relieved if the patient is not operated on before the finer bile capillaries become clogged

In five instances of congenital lesions of the ducts with complete biliary obstruction under treatment at the New York Post-Graduate Hospital during the past year, two were found to be amenable to surgery at the time of the operation A congenital cystic formation of the common bile duct was relieved by cholecystogastrostomy and a complete atresia of the common hepatic duct by hepaticoduodenostomy The patient with cystic formation has recovered, the second case, with complete atresia, has bile in the stool and is developing well, although a little jaundiced still The three cases in which restoration of bile flow could not be accomplished were in the older age group, the oldest being twenty-two months of age The main intrahepatic bile ducts were explored in both lobes of the liver without finding a lumen large enough to anastomose satisfactorily to the intestinal canal The terminal bile capillaries were distended with bile casts From the cut surface of the liver, small amounts of bile drained for a few weeks after the operation. Some improvement was noted from the hepatotomy and external drainage of the intrahepatic areas, but nothing approaching a real bile flow could be established for turning into the intestinal canal We hope to get cases earlier for no one knows whether the condition is entirely due to changes during intrauterine life or whether the process may not continue on after birth Earlier operation should reveal less clogging of what ducts may be found and give the liver a better opportunity to re-establish external secretion after the ducts are opened up

As we have said, this paper of Dr Donovan's contains most valuable points for every general surgeon to study carefully for improving his diagnosis and operative procedures to be used in this special field of surgery in early life

---

A TRIBUTE TO DOCTORS

For my dough, the most important people in the world are doctors

If you cut yourself, if something starts biting at your insides, if your kid breaks out in spots, whom do you holler for? Your Congressman? The president of your bank? The Secretary of War? Not on your tintype. You send for the man with the little black satchel.

I sometimes think it wouldn't make very much difference to this world if it took most of its inventors, [illegible] and generals, and ground them up for [illegible]

Inventors have given us a lot of cute things to play with—steam heat, electric lights, radio and the telephone But inventors are also responsible for the airplane, the submarine and the atomic bomb, which has the world standing on one foot

I feel pretty much the same about politicians as I feel pretty much the same about politicians whether being in charge for five thousand years, they've never got us up the well-known creek. Every twenty years or so, one of them makes the same speech that his predecessors of yesterday, my country is at war with your country "

And as for generals, I never could get very excited about any of them. Patton was a picturesque fellow but let's face it Was he as important a strategist as Pasteur, who put the hex on germs, or Lister who put the finishing touches to penicillin? Not in my book

When I was a kid, I had scarlet fever, and they tacked up a sign on my house and nobody could come near me But a small gent with a black bag walked right in I can still see the tiny red veins on his nose and smell the iodoform and tobacco on his suit

I remember asking my mother, "Can't doctors catch scarlet fever? She said they couldn't—but she was fibbing The list of doctors who were killed by the bugs they were chasing would stretch from here to Valhalla.

During the last century, doctors have added something like thirty years to the average life expectancy I can't speak for the fellow next door, but I wouldn't swap one spring of the extra thirty for a chunk of gold as big as Radio City

Of course, the great standouts of medical science don't need any ballyhoo from me But the doctor who rides around in that 1937 Chevvy could use a little applause. In a civilization that rates a guy by how big a check he can write, the doctor knocks his brains out for less than we pay a bricklayer or a plumber Sun or slush, he's on tap if you're in trouble Twenty-four hours a day he stands ready to stop what's hurting you.

To me that's as important as anybody can get — *From "Wine Women and Words," by Billy Rose 1948*

A COOPERATIVE PROGRAM IN RESTAURANT HYGIENE

MEREDITH H THOMPSON, D Eng , Troy, New York

(Director of Environmental Hygiene, Rensselaer County Department of Health)

ALTHOUGH faulty restaurant hygiene has not been proved to be a major cause of mortality, and the correction of errors in food handling in restaurants may not be considered the most important function of a health department dedicated to the reduction of mortality, prevention of disease, and promotion of health, public demand and the dramatic nature of food-borne disease compel the local health department to serious consideration of the problem How-ever, in a program of restaurant hygiene, the health department should place emphasis upon those phases of the problem having a direct bear-ing on the public health This the Rensselaer County Department of Health has attempted to do

The Rensselaer County Department of Health is one of the newest county health departments in New York State, having been established Novem-ber 1, 1946, the first under new laws passed by the 1946 State Legislature This county health department differs from those previously func-tioning in New York State in that the unit was the first to have included within its jurisdiction a city of more than 50,000 population, namely, Troy, New York, where the health department head-quarters are located

Organization of the Department

The Division of Environmental Hygiene, the sanitation arm of the department, was organized on January 1, 1947 Organization of this unit or similar units entails at least four major func-tions

1 Classification and adequate training of both transferred and new personnel Some employes had no previous sanitation experience, while others had experience in limited fields

2 Detailed field surveys of existing sanitary conditions

3 Establishment of adequate and efficient sy s-tems of records and methods of reporting

4 Determining and establishing policies and procedures for all personnel, functions, and records

Although all four functions are important and of interest to those associated with the organiza-tion or many phases of a health unit, at this time we are considering the policies and procedures of a restaurant program At the outset of operation it was agreed that the over-all policy of the environmental sanitation division should be of education, cooperative supervision, and operative and instructive inspection The for such a policy was indicated forcefully by preliminary survey of some 350 restauran determine existing sanitary conditions, v indicated that many conditions, including washing, dish handling, food storage, and handling were unsatisfactory at most of the ing establishments surveyed This conditi not necessarily peculiar to Rensselaer Co but would probably become apparent elsew by a similarly intensive and detailed survey

This survey indicated that, although ins tions (more properly called visits) had carried on for many years by city and S agencies, no noticeable permanent improvem had been accomplished, and, more import that the employes and managements had l or no knowledge of restaurant hygiene It also apparent that the restaurant employes, i most areas, had little respect for and were friendly toward the inspector This had l admitted subsequently by numerous emplo who give the reasons for their attitude as unconstructive criticism, noncooperativen lack of personal knowledge, and police attitud most previous inspectors

Food outbreaks such as occur at restaur are not prevented by police methods, but by g day-by-day hygienic technics of the owners employes, who, therefore, require educat instruction, and cooperation The preventio Staphylococcus poisoning and Salmonella in tions caused by food-handling establishme depends upon the knowledge of the propriet and employes as to the cause of these conditic and their willingness to take proper precautic Education is more important than inspection

Organization of the Program

These were the major factors to be taken i account in organizing an efficient and progress restaurant hygiene program for Rensse County It was believed that such a progr could be carried out only if (1) department p sonnel were qualified and well trained in aspects of restaurant hygiene, (2) departme personnel were instructed in public relations, (restaurant management and personnel we educated to know the reasons for and how accomplish desired conditions, (4) the departme provided a cooperative and instructive inspectic

Presented by invitation, at the 142nd Annual Meeting of the Medical Society of the State of New York, Section on Public Health, Hygiene and Sanitation May 20 1948

service, and (5) a method of getting voluntary compliance with sanitary regulations by the restaurant personnel and management could be devised All of the items are important, and all must be accomplished for a program to be progressive. Without any one of these a completely adequate program is not probable

Training of Personnel

The training of personnel in restaurant hygiene and public relations was accomplished in part over a period of approximately one year, by an intensive in-service training program, including classroom lectures, demonstrations, and field inspections It was furthered also by eliminating from this work that group of personnel who were not only not qualified but also seemed incapable of becoming qualified

It is necessary to remember that sanitary inspectors are important in the public relations of the health department, since they have personal contact with the public They may help sell and build up public confidence in the work of the department, or may seriously hamper the progress of their own program and the efforts of other branches to gain complete public support It is necessary that the inspectors have tact and a good personality, are neat, and have a fundamental understanding of the work

All personnel of the division on inspection work are instructed to make no recommendations for alterations or changes, unless the inspector is able to provide a logical reason for requiring the alteration or change and show how it can be accomplished This practice works wonders on many inspectors, because they must stop and consider each recommendation before making it, with the result that few impractical recommendations are made The inspector also finds that he has less tendency to criticize when it is necessary for him to provide a logical explanation.

Education of Restaurant Personnel

The education of restaurant managers and personnel has been carried out partially through the institution of food handlers schools similar to other such schools held throughout the United States in the past ten years These schools consist of four sessions of approximately one and one half hours duration each At these sessions, lectures, demonstrations, and visual aids are used to the fullest extent School enrollees are given an idea of what germs are and their relation to the transmission of disease, how to wash and handle dishes, how to refrigerate, display, store and handle food, and, of great importance, personal hygiene

Why do these people need to know about germs? Suppose an inspector has made swab tests of dishes and silverware of a restaurant, and the bacterial counts are high It is the inspector's job to educate the dishwasher or other personnel on methods of dishwashing, handling, and storage The inspector returns to the restaurant and begins a friendly explanation about the restaurant's dirty dishes The dishwasher, perplexed, picks up a glass, closely scrutinizes it, and rightfully states, "This glass looks clean to me" The inspector states, "Physically the glass is clean, but numerous germs or bacteria are present on the glass, and they must be removed"

How can this dishwasher be expected to remove something he can't see and doesn't know about? If he knew a little about what bacteria are and how they function he might be expected to see the reasons for the inspector's trying to get better dishwashing, disinfection, and satisfactory dish handling, as well as refrigeration Unless the employe knows some of the background of his particular problem he can't be expected to do a good job It isn't axiomatic that, since a person operates a restaurant or does a particular job in a restaurant, he knows all about food handling or all about his particular job He may have ten years of experience, but it may be ten years of one-year experiences

All persons attending all four sessions of a food handlers school and passing a simple true-false type quiz are issued a certificate of attendance

Inspection Service

A cooperative and instructive inspection service is in force 100 per cent today The success with which cooperative and instructive inspection works is best illustrated by the facts that restaurant personnel willingly discuss their problems with the inspector, actually point out things they believe they may be doing incorrectly, and telephone the health department office asking that the inspector pay them a visit The restaurant employes have come to know that the health department is trying, by cooperation, to maintain certain standards at eating establishments, in order to protect the health not only of the public but also of the employe The employe is convinced that an inspector will not criticize him unjustly or just to show his authority, but, instead, if some item isn't satisfactory, will explain what is unsatisfactory, why it is unsatisfactory, and either tell or show him how to correct it The employe also knows he will be given an opportunity to give his views on the subject and receive serious consideration—and it's surprising how often the restaurant employe has a good reason for his method of operation

A COOPERATIVE PROGRAM IN RESTAURANT HYGIENE

MEREDITH H THOMPSON, D Eng , Troy, New York

(Director of Environmental Hygiene, Rensselaer County Department of Health)

ALTHOUGH faulty restaurant hygiene has not been proved to be a major cause of mortality, and the correction of errors in food handling in restaurants may not be considered the most important function of a health department dedicated to the reduction of mortality, prevention of disease, and promotion of health, public demand and the dramatic nature of food-borne disease compel the local health department to serious consideration of the problem However, in a program of restaurant hygiene, the health department should place emphasis upon those phases of the problem having a direct bearing on the public health This the Rensselaer County Department of Health has attempted to do

The Rensselaer County Department of Health is one of the newest county health departments in New York State, having been established November 1, 1946, the first under new laws passed by the 1946 State Legislature This county health department differs from those previously functioning in New York State in that the unit was the first to have included within its jurisdiction a city of more than 50,000 population, namely, Troy, New York, where the health department headquarters are located

Organization of the Department

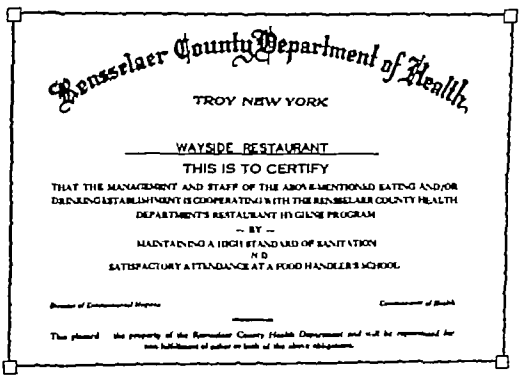
Inspection Service



A cooperative and instructive inspection service is in force 100 per cent today The success with which cooperative and instructive inspection works is best illustrated by the facts that restaurant personnel willingly discuss their problems with the inspector, actually point out things they believe they may be doing incorrectly, and telephone the health department office asking that the inspector pay them a visit The restaurant employes have come to know that the health department is trying, by cooperation, to maintain certain standards at eating establishments, in order to protect the health not only of the public but also of the employe The employe is convinced that an inspector will not criticize him unjustly or just to show his authority, but, instead, if some item isn't satisfactory, will explain what is unsatisfactory, why it is unsatisfactory, and either tell or show him how to correct it The employe also knows he will be given an opportunity to give his views on the subject and receive serious consideration—and it's surprising how often the restaurant employe has a good reason for his method of operation

Previously, the only instruction an employe received from an inspector was, "Don't do this," "Don't do that"—with possibly a $25 fine added No one usually stopped to explain, for example, why cream-filled pastry should be refrigerated But, after fining or a police-like inspection, has that inspection agency actually accomplished anything? We believe not, and the records seem to bear us out Instead, the employe and restaurant owner are both angry at the inspecting agency for (1) wasting the taxpayers' money, (2) wasting the owner's and the employe's time, (3) usually making impractical requirements, and (4) providing no assistance This type of inspection procedure causes personnel to become upset and more careless, consequently creating a more serious health hazard within their own establishment than existed prior to the inspection

Let us not forget that the restaurant owner and employe prefer to be treated like human beings, and that they have the same sense of American fairness as other people The modern inspector should be a coworker and friend, not the old type police inspector with badge and uniform

Securing Voluntary Compliance

Securing voluntary compliance is being accomplished by the use of a well-designed, attractive, framed placard which may be displayed by

Rensselaer County Department of Health

TROY NEW YORK

WAYSIDE RESTAURANT

THIS IS TO CERTIFY

THAT THE MANAGEMENT AND STAFF OF THE ABOVE-MENTIONED EATING AND/OR DRINKING ESTABLISHMENT IS COOPERATING WITH THE RENSSELAER COUNTY HEALTH DEPARTMENT'S RESTAURANT HYGIENE PROGRAM

— BY —

MAINTAINING A HIGH STANDARD OF SANITATION

AND

SATISFACTORY ATTENDANCE AT A FOOD HANDLER'S SCHOOL

Director of Environmental Hygiene — Commissioner of Health

This placard is the property of the Rensselaer County Health Department and will be repossessed for non-fulfillment of either or both of the above obligations.

FIG 1

the management, indicating not necessarily approval by the health department but (1) that at least 50 per cent of their personnel have attendance certificates indicating voluntary attendance at a food handlers school conducted by the Rensselaer County Department of Health, and (2) that the management and employes are voluntarily maintaining optimum sanitary standards (Fig 1) The placard, the property of the health department, is issued only after two consecutive inspections indicate all conditions are satisfactory, and may be repossessed for noncooperation on important points of sanitation or not sufficient personnel holding attendance certificates

The appearance of the placard in the window of one restaurant causes the customers of the nearby eating establishment to ask the manager why his establishment doesn't display a placard Continued explanations, such as, "My dishes aren't clean," become embarrassing to the manager, with the result that he requests information as to what is necessary to obtain the placard By this method it is found unnecessary to issue annual permits—the issuing of which takes a great deal of time of an office staff, and which, after being issued, usually have very little significance to the health department or to the consuming public, who constitute the main reason for restaurant hygiene In many departments using annual permits, no attempt is made to revoke permits for infractions of the sanitary code unless the department is certain of successful prosecution in court Therefore, it appears simpler and more effective in getting corrections merely to indicate that certain corrections should be made to obtain a placard, or, if a placard is already possessed, that certain additional corrections or alterations should be made to prevent it being necessary for the health department to repossess the good-standing card

Conclusion

Under this plan of education and cooperation, the eating establishments in Rensselaer County have shown tremendous improvement At the same time, an atmosphere of friendship has been built between the health department, the owner, and the employe It is believed that this cooperative restaurant hygiene program has accomplished and will continue to accomplish more in public health results than a system of policing prosecution, and fines

---

THE GASTROPHILE

My very best friend is my stomach,
A source of great joy and delight,
I push it about in the daytime,
And often far into the night.
But (such are the beauties of friendship),
Although I've abused it for years,
It noisily greets me at dawning
And promptly burps up its worst fears

—Anonymous

IMPORTANCE OF VASOCONSTRICTION IN THE TREATMENT OF ACUTE AND CHRONIC MAXILLARY SINUSITIS

A REGINALD EVERETT, M D New York City

(From St Luke's Hospital and Ear, Nose and Throat Outpatient Department)

A REVIEW of the literature reveals little reference to the importance of decongesting the antral mucous membrane A detailed study and follow-up of 171 cases of acute and chronic maxillary sinusitis has led us to believe that many of the failures with the local use of penicillin and the sulfonamides may be attributed to this [1] Because of numerous conflicting reports as to the degree of benefit derived from various preparations of these compounds, it was decided in 1944 to investigate systematically the effects of the more popular agents in the treatment of acute and chronic sinusitis

Shortly after Turnbull advocated the use of sodium sulfathiazole in the treatment of sinusitis, we evaluated the use of a freshly prepared 5 per cent solution of sodium sulfathiazole instilled into the maxillary sinuses after irrigation with normal saline solution [2] Soon thereafter, there became available a stabilized preparation containing 2 5 per cent of sodium sulfathiazole and a vasoconstrictor, 0 125 per cent dl-desoxyephedrine hydrochloride * One particular advantage of this product was the presence of a vasoconstricting agent Furthermore, it was considerably less irritating to the nasal mucosa than plain sodium sulfathiazole in higher concentration Several years experience with the use of this compound had shown that it produced highly satisfactory results in the treatment of acute and chronic sinusitis (Table 1) Encouraged with our results we continued our studies with other therapeutic agents

As is true of infections elsewhere in the body, it seems rational to select the compound most efficacious for dealing with a specific organism or strain It would seem logical that sulfadiazine might succeed where sulfathiazole failed However, the results with Pickrell's solution, which contains sulfadiazine but no vasoconstrictor, were not so impressive in these cases as the results with sulfathiazole containing the vasoconstrictor Tyrothricin was also investigated, as a 1 per cent solution in isotonic sodium chloride In approximately 50 instances of antrum irrigations, the results were not sufficiently impressive to warrant the continued use of this substance

The wide use of penicillin and the favorable results of its intramuscular injection and, in certain cases, of its topical application indicated that its local use for sinusitis might prove beneficial Therefore, in December, 1944, my colleagues and I began investigating the effects of penicillin instilled into the maxillary sinus after irrigations in cases both of acute and of chronic infections After irrigation of the antrum and displacement of the isotonic solution of sodium chloride with air, 2 to 4 cc of isotonic solution of sodium chloride containing 10,000 units of penicillin per cubic centimeter was instilled and allowed to remain in the sinus The results were disappointing, as can be seen in Table 1 The published reports of others indicated similarly poor results [3–6] Fowlkes wrote, "I have not been able to obtain satisfactory results with the local use of penicillin instilled into the sinus cavities, either in acute or chronic cases" [4] Woodward and Holt reported good results in acute cases but failures in all of their chronic cases [7]

In reporting a comparative study of 95 cases of the local use of penicillin and of Sulmefrin in acute and chronic sinusitis, we concluded that the results with the sulfonamide in combination with a vasoconstricting agent was much superior to the plain penicillin in saline solution [1]

More recently, we have studied the effects of a newly developed ephedrine salt of penicillin * The results have been surprisingly good, comparing favorably with the Sulmefrin in the acute cases and more effective in the chronic cases (Table 1) The response in some of the chronic cases was spectacular, and we are in agreement that many patients were thus spared antrotomies or Caldwell-Luc operations To date we have treated 60 cases of maxillary sinusitis with Tersavin. A total of 53 of these was cured, a considerable number having previously received one or more of the other forms of medication without apparent benefit

Since the results with the two therapeutic agents containing a vasoconstrictor had been good and the results with the three containing no vasoconstrictor had been poor, we became curious as to whether or not the whole benefit came from the vasoconstriction Therefore, we treated a similar group of cases, instilling only a

* Sulmefrin.

* Tersavin—buffered tablets of the l-ephedrine salt of penicillin G Experimental material supplied through the courtesy of Dr E. L. Sevringhaus Hoffmann La Roche Nutley New Jersey

TABLE 1.—Comparison of Results with Various Therapeutic Agents in the Treatment of Maxillary Sinusitis

Maxillary Sinusitis	Sodium Sulfathiazole and dl Desoxyephedrine —Hydrochloride— Cured	Not Cured	Penicillin in —Normal Saline— Cured	Not Cured	l Ephedrine Salt of —Penicillin G— Cured	Not Cured	dl Desoxyephedrine Hydrochloride in —Normal Saline— Cured	Not Cured
Acute	35	3	9	7	31	3	9	3
Subacute	8	0	2	0	4	0		
Chronic	13	6	3	8	18	4	0	5
Total	56	9	14	15	53	7	9	8

vasoconstricting agent, 0 125 per cent desoxyephedrine The results were inferior to Sulmefrin and to Tersavin in both acute and chronic cases but in the acute cases were superior to plain penicillin (Table 1) All five of the chronic cases failed to respond to the desoxyephedrine, but four of these were later cured with Tersavin. The only reason for this series being small is that the results were not sufficiently impressive to warrant its further use

After a careful analysis we have come to the conclusion that the presence of an effective, nonirritating vasoconstrictor in low enough concentration to avoid undesirable secondary effects, together with an antibiotic or chemotherapeutic agent is essential to obtain consistently prompt and effective results This is not surprising if one takes into consideration the intense edema of the mucous membranes lining the sinuses during an infection The introduction of a solution containing a vasoconstricting agent produces decongestion and shrinkage of the mucous membrane, thus exposing a greater surface area to the bacteriostatic component Patients with acute and chronic ethmoiditis showed good response to treatment when Sulmefrin and Tersavin were instilled into the antrum The prolonged and gradual escape of the bacteriostatic and vasoconstricting agent into the middle meatus has provided increased drainage to the ethmoid cells and has exposed them to more prolonged contact with the bacteria-inhibiting compound Their enhanced effectiveness in maxillary sinusitis is attested to by the decreased number of individual treatments required for resolution of the disease process (Table 2) Dysart in measuring the overflow capacity of the antrum found that during an acute attack of sinusitis the capacity of 2 or 3 cc might later become 12 or 15 cc after resolution of the infection, indicating the degree of edema of the sinus mucous membrane [6]

TABLE 2.—Average Number of Instillations Needed to Effect a Cure

	Acute	Chronic
Sulfathiazole with ephedrine	3 4	6
Penicillin in saline	4 6	6
Penicillin in ephedrine (Tersavin)	3 1	4 9

Mode of Treatment

Cultures from the antrum were taken, the amount and type of pus recorded, and, after appraisal of the history, the patients were classified as acute, subacute, or chronic (Table 3)

TABLE 3.—Type of Bacterial Infection Encountered

	Acute	Subacute	Chronic
Pneumococcus	28	2	5
Staphylococcus albus	23	3	11
Staphylococcus aureus	15	1	10
Streptococcus hemolyticus	10	1	1
Streptococcus nonhemolytic	8	3	7
Streptococcus viridans	5	2	8
Micrococcus catarrhalis	3	3	1
No growth	3	0	0
Hemophilus influenza	1	0	2
Colon aerogenes group	0	0	2

Irrigation with normal saline solution was carried out through the middle meatus by means of the Bowers cannula The solution was displaced by air, inclining the head toward the opposite side The head was then deviated to the other side of the midline, and the antrum completely filled with the Sulmefrin or desoxyephedrine solution, in the cases of plain penicillin dosage 2 to 4 cc of saline solution containing 10,000 units per cubic centimeter were employed When Tersavin was used, one buffered tablet containing 30,000 units of penicillin and 9 mg of ephedrine was dissolved in 4 or 5 cc of sterile tap water and was instilled into the antrum None of these patients received any chemotherapeutic or antibiotic agents systemically

No serious evidence of irritation or of sensitivity has been encountered nor have we noted any side- or after-effects from the ephedrine or the desoxyephedrine Of the three cases in which we cultured Hemophilus influenza and the two of the colon group, none responded to either the Tersavin or the Sulmefrin It may be of interest to point out that, although the manufacturer of Tersavin recommends that distilled water be used in the preparation of the solution from the tablets, we routinely employed sterile tap water without observing any deleterious effects therefrom

Favorable results with parenteral streptomycin in laryngotracheobronchitis cases with positive influenza cultures and the known susceptibility of the colon group to streptomycin have led

us to the use of streptomycin locally in the antrum—5 mg per cc in 1/4 per cent ephedrine We are encouraged by the results, but our present experience is too limited for further comment at this time

Summary

1 A series of 171 cases of acute and chronic maxillary sinusitis treated with sulfathiazole, penicillin, and/or a vasoconstrictor is presented

2 A vasoconstricting agent in combination with a bacteria-inhibiting compound appears to be essential in treating these infected mucous membranes

3 The crystalline l-ephedrine salt of penicillin G is the most effective and one of the least toxic agents which we have used in the treatment of acute and chronic sinusitis

ANNOUNCEMENT

The Board of Medical Examiners of the New York State Education Department has notified the State Department of Health of action taken by the Board of Regents with respect to the medical licenses of the following persons

Maynard Smith Owen, Delaware, Ohio License revoked, annulled and canceled, effective September 30, 1948

Louis Klein, 68 Pratt Street, Hartford, Connecticut. To be censured and reprimanded, effective September 30, 1948

Walter G Connor, Detroit, Michigan Osteopathic license revoked, annulled and canceled, effective August 4, 1948.

Ellis Charles Johnson, 151 16th Street, Buffalo, New York. Physiotherapy license revoked, annulled and canceled, effective July 13, 1948

Benjamino Aquaro, also known as Benjamin Aquaro-Deodati, 637 Lorimer Street, Brooklyn, New York. License suspended for a period of six months from July 29, 1948

Robert J Tuttle, 92 West Main Street, Gowanda, New York License revoked, annulled and canceled, effective July 6, 1948

Charles S Yongue, 654 Madison Avenue, New York Suspension of license for six months modified to suspension for two months, suspension being effective July 13, 1948 to September 13, 1948

Emery Gibson Minckler, 141 East 150th Street, New York. License revoked, annulled and canceled, effective July 8, 1948

Edward H Willie, New York State. License which was annulled and canceled April 26, 1928, restored, effective July 31, 1948

Edward O MacDonald, Roselle Park, New Jersey To be censured and reprimanded, effective October 19, 1948

Albert G Pohly, 24 West 59th Street, New York. To be censured and reprimanded, effective December 6, 1948

Lloyd Gray, New York State Vocational Institute, West Coxsackie, New York. License revoked, annulled and canceled, effective December 3, 1948.

VISCERAL ACTIVITY IN SMALL BOWEL PERFORATION

BERNARD J FICARRA, M D , Brooklyn, New York

(From the Department of Surgery, Saint Peter's Hospital)

IN A PREVIOUS survey I reported 18 cases of traumatic perforation of the small intestine due to nonpenetrating abdominal injuries [1] At that time attention was called to the fact that blunt trauma to the abdomen can result in multiple rents in the small intestinal tract Following an injury of this type the patient may be free of acute symptoms for many hours after the trauma Subsequently, the first sign of intra-abdominal pathology may be a complicating peritonitis At the time of operation certain observations were made which assisted in determining the reason for this absence of abdominal signs In the early stages of acute traumatic perforation of the small intestine, only a small amount of intestinal contents empties into the peritoneal cavity The reason for this is a protecting mechanism on the part of the small intestine as a response to noxious stimuli This clinical observation has been verified in experiments on the small intestine of rabbits Such an experimental study is the topic of this paper

Protective Physiology

Normal activity of the small intestine is produced by muscular and nervous elements The exact mechanism by which this is regulated, however, is not fully known The nervous component of small bowel activity resides in the sympathetic and parasympathetic nervous systems The vagi increase the tone and activity of the small intestine The sympathetic chain has the opposite effect of decreasing the tone and activity Physiologically, it is known that, even though the vagus and sympathetic nerve supplies may be divided, small bowel peristalsis continues Excised segments of the small intestine continue to exhibit rhythmic activity This activity is not unlike cardiac activity when the heart is extirpated from the thoracic cavity For this reason it is logical to suppose that intestinal movements may be continued by means of local activity of the muscular layers These layers are both circular and longitudinal fibers which apparently have an intrinsic activity similar to cardiac muscles The application of mechanical and chemical stimuli to the small intestine as it resides within the peritoneal cavity of the rabbit produces a contracture above the point of stimulation and relaxation below this point This activity is controlled and produced by Auerbach's plexus, which brings about coordinated intestinal activity Some physiologists have applied the term "law of the intestine" to this activity of contraction and relaxation following stimulation of the small intestine

This normal physiologic activity is an inherent characteristic of the small intestine It is also a protective mechanism which prevents an excessive spilling of intestinal contents into the peritoneal cavity following traumatic rents through all layers of the small bowel Experimentally, perforations were made in the small intestine of rabbits These commenced in the serosa, passed the mucosa and entered the lumen of the bowel Immediate active contraction of the small intestine above the site of perforation with relaxation below this site always occurred (Fig 1)

FIG 1 Small intestine of a rabbit showing contraction and relaxation of the intestine above and below the point of noxious stimulus Area is marked with a hemostat.

This activity prevented the elimination of intestinal contents above the site of perforation The relaxation below the point of injury permitted the emptying of intestinal fluid into the distal segments of the intestine without the extravasation of intestinal contents into the abdominal cavity This procedure was performed innumerable times on the intestinal tracts of rabbits. Never have the above results failed to occur The procedure was repeated at the same site on many occasions until muscular fatigue prevented additional responses to noxious stimuli Muscular fatigue, however, did not occur sooner than four hours following constant stimulation

This activity of small intestines explains clinically the apparent delay of clinical symptoms in the group of patients previously reported [1] From the evidence offered experimentally it appears proper to assume that, in traumatic perforations of the small intestine, human intestinal activity closely parallels that observed in the rabbit A rent in the small intestine may occur in a patient who has been the victim of blunt trauma to the abdomen. However, the protective activity of contraction above with relaxation below the point of perforation prevents the spillage of intestinal contents into the peritoneal cavity, thus delaying the onset of peritoneal irritation and its subsequent chain of symptoms However, when muscular exhaustion occurs, this protective activity ceases and the initial signs of peritonitis occur If this type of patient is operated upon within this period of protective muscular activity of the small intestine, the prognosis is better than after the onset of peritonitis This fact is in keeping with the results of our survey of 18 patients who had small bowel perforations The conclusions drawn from our study of 18 cases coincided with the experience of others that traumatic perforation of the small intestine is associated with an unusually high mortality This mortality can be definitely lowered if surgical intervention occurs within that period of protectivity exercised by small intestine

This experimental observation is offered as clinically important because of the fact that several questions associated with the traumatic abdomen can be answered First, the freedom of serious symptoms immediately following blunt injury to the abdomen is explained Second, the optimum time of surgical intervention is during this period of protectivity Exploratory laparotomy during the protective period will be the deciding factor in lowering the mortality in traumatic intestinal perforations

Conclusions

1 Experimental and clinical observation on the protective activity of small intestine physiology in traumatic perforation is recorded

2 The clinical importance of this observation in lowering the mortality in traumatic perforations of the small intestine is explained

3 This protective activity is a characteristic of the small intestine beyond the duodenum and does not include the colon.

LAWS REGULATING DP DOCTORS PROTECT AMERICAN PEOPLE

Laws which confront foreign physicians who want to practice medicine in the United States were set up as a protection against unqualified and incompetent doctors, explains an editorial appearing in the November 13 issue of the *Journal of the American Medical Association*

The editorial says in part

"The laws regulating medical licensure were not adopted for the protection of the medical profession but for the protection of the American people against unqualified and incompetent doctors The laws of the various states differ Some states require full citizenship, others require first papers, some require a year of internship in a hospital within the state, many of them demand fully accredited credentials which physicians from foreign countries frequently do not have.

"The medical schools of many of the foreign countries have been in a deplorable state since the beginning of the Nazi invasions. Recently (at the Forty-Fourth Annual Congress on Medical Education and Licensure, Chicago, February 10, 1948), Dr Irving S. Wright of New York, civilian consultant in medicine to the Surgeon General of the United States Army, reported on a study of the schools of Europe. One of the chief difficulties has been the attempt of the schools to take on more students than they could teach properly, since they suffer from a lack of teaching personnel and equipment

"Europe was completely shut off from scientific information developing elsewhere in the world during at least the years 1939 to 1944. Foreign doctors knew nothing whatever of the development of antibiotic drugs, of new methods of anesthesia, and of any other new medical technics which had been developed elsewhere Estimates indicate that there are about 2,000 physicians in DP camps. It is unlikely that more than a few of these will eventually come to the United States.

"Many of them will accompany the people with whom they fled from their own countries Most of them had such a difficult time keeping alive during their flight that they had little opportunity to keep abreast of medical knowledge. The younger physicians graduated from medical schools which have had a serious time trying to survive since 1933

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

AT ITS meeting on December 9, 1948, the Council considered the following matters, taking action as indicated

Secretary's Report

Remission of Assessments—Remission of annual assessments was voted on account of service with the armed forces for one member for 1948 and three members for 1947

Communications—1 Letter from Dr William A Petry, president of the Greene County Medical Society, December 2, 1948 "Please tell me if or not the State Society approved of a member putting such titles as F A C S , F I C S , Diplomate of Am Board of Int Med , on his stationery, business cards, prescription blanks, etc"

It was voted that this be referred to the Committee on Questions on Ethics

2 Letter from Martha R Wegner, executive secretary, New York State High School Athletic Protection Plan, Inc , November 29, 1948, requesting the State Society to send copies of the Plan's General Information Bulletin to the membership

After discussion, *it was voted* that the Secretary be instructed to reply, stating New York State High School Athletic Protection Plan, Inc , can secure names of physicians from the Medical Directory of New York, New Jersey, and Connecticut, also

It was voted that the Bureau of Medical Care Insurance study this corporation's insurance form.

Meetings—On November 12, 1948, your Secretary was present at a meeting in the New York City Office of the State Education Department which was attended by Dr Robert R Hannon, Executive Officer, Dr Richard A Kovacs and Dr Madge C L McGuinness, as well as several licensed physiotherapy technicians, their lawyer, Dr Irwin A. Conroe, Assistant Commissioner for Professional Education, Dr Jacob L Lochner, Jr , secretary of the State Board of Medical Examiners, and Mr James A. Malaney, Executive Secretary of Professional Conduct

The physical therapy technicians seemed desirous of having the existing law changed so as to allow them legally to practice without the prescription or supervision of a licensed physician They stated brazenly that they did so now and for that reason claimed the law should be changed

On November 18 your Secretary attended the Middle Atlantic States Regional Conference on Medical Service of the American Medical Association, at the Philadelphia County Medical Society, Philadelphia, Pennsylvania. Also present were Dr Carlton E Wertz, chairman, Committee on Medical Service, Dr J Stanley Kenney, Councilor, Dr Laurance D Redway, Assistant Managing and Literary Editor of the NEW YORK STATE JOURNAL OF MEDICINE, and Mr George P Farrell, director of the Bureau of Medical Care Insurance The morning session was devoted to the subject, "What Is the Responsibility of the Practitioner in Regard to Hospital Financing?" The afternoon session was spearheaded by Dr Paul R Hawley and the subject was "Blue Cross-Blue Shield Commission Proposals." During luncheon, Dr Joseph S. Lawrence discussed the "Washington Horoscope" Dr J Stanley Kenney was selected to be a member of the Executive Committee of this body for the ensuing year

On November 23, your Secretary attended a meeting of the Advisory Council on Nursing of the New York State Education Department in Albany Among other business at this meeting, it was voted to recommend that the Department of Education support a proposed bill to allow dentists legally to give orders to nurses, in caring for patients

On November 28 and 29, 1948, your Secretary attended the American Medical Association Conference of State Medical Association Secretaries and Editors at the Hotel Statler, St Louis, Missouri. The program included a Symposium on Medical Legislation, a Symposium on Osteopathy, a Report on Cooperative Medical Advertising Bureau, conferences on Medical Society Radio Programs, Medical Hospital Prepayment Plans, and Medical Legislation. Also, a clinic was held regarding state medical journals at which *Arizona Medicine*, the *Pennsylvania Medical Journal*, the *Journal of the South Carolina Medical Association*, and the *Texas State Journal of Medicine* were discussed from a symptomatic and therapeutic standpoint Dr Paul R. Hawley addressed the conference on "Medical and Hospital Care Prepayment Plans" and Dr James C Sargent, chairman of the American Medical Association Council on National Emergency Medical Service, delivered an address entitled, "Medical Care of the Nation in the Event of Another War"

On November 30 and December 1, 1948, your Secretary attended the Interim Session of the House of Delegates of the American Medical Association in St Louis, Missouri

Also, on December 1, 1948, your Secretary conferred for an hour with Mr Rolen Waterson, executive secretary of the Alameda County (California) Medical Association, regarding prevention of suits for malpractice

Since returning to New York your Secretary has attempted to accomplish the work which had accumulated during his absence He has attended committee meetings, yesterday and the day before, and on December 7 he attended a meeting of the Board of Censors of the Medical Society of the County of New York.

It was voted that the report be *approved* and the recommendations *adopted*

Treasurer's Report was accepted

Report of the Executive Officer

Dr Hannon stated he had been busy with his usual office routine, and preparing for future legislation

Activities of Committees

Legislation—Dr Holcomb, acting chairman, reported verbally as follows

I would like to give a report to the Council on our meeting of November 9 at the Hotel Roosevelt Those present were Dr Mott, Dr Mitchell, Dr Kenney, Mr Martin, and Mr Clearwater for our legal department, Mr Farrell, Dr Anderton, Mr Dwight Anderson, Mr Walsh, Mr Miebach, and Dr Hannon, our executive officer

At that time we took up the mandates from the House of Delegates

The first is our acknowledgment of the splendid work done by Mr Dwight Anderson and his staff

in preparing the *Legislative Manual* for county society presidents and legislative chairmen It is comprehensive, direct, and gives them a definite idea of the procedures necessary to introduce legislation in the State legislature

In the matter of the Wicks Commission Report, a letter was sent out, as approved by this Council. I have interviewed one of the staff of Senator Wicks' office, who has a great deal to do with, and is conversant with this report which deals with all of the professions He has gone over our communication, and he has given me the assurance that it is the intent of Senator Wicks to hear the various groups in Albany, when he will take up the specific objections we have made In other words, we will be given a hearing before legislation is enacted It is splendid that we have such assurance.

Dr Hannon has notified the New York State Dental Society that the Legislative Committee and the Council approved the proposed amendment to the Nursing Law favored by them You will recall that had to do with allowing a dentist to write or authorize treatment by nurses of a hospital patient

The first question we discussed was Section 94 which pertained to the abolishment of the Medical Practice Committee of the Workmen's Compensation Board. This was a mandate from the House of Delegates that the Legislative Committee have introduced a bill to abolish the Medical Practice Committee We have heard arguments for introducing this bill, and also for introducing a bill that would cut down the activities of the Medical Practice Committee

We find that it will be extremely difficult perhaps to get favorable legislation on the abolishing of this Medical Practice Committee. Apparently many of the legislators are kindly toward it I think the Department of Labor favors such a committee, but we will carry out the mandate of the House of Delegates and introduce the legislation

Dr Hannon has called my attention to the fact that last year, of the questionnaires he sent out to all the sixty-one county medical societies, only six were answered—all affirmative However, with such meager support you can see it will not be easy to get favorable legislation on this matter

On Section 106, the bill to amend the law for relief by injunction, we decided that the Tartikoff Bill, in which is eliminated certain words, such as "criminal," was the better bill of the two, and we recommend that bill. I might call your attention to the fact that this injunction bill is favorably reported by the Wicks Commission I have spoken to the member of the staff of Senator Wicks's office to whom I previously referred. He feels that there is a good chance of the injunction bill being adopted.

In our county society meeting this week I asked to have passed a resolution favoring this bill (the injunction bill) The society requested Senator Wicks and our assemblyman to introduce the bill themselves This resolution was passed and will be sent to the two legislators Of course, a copy will be sent to the Albany office for Dr Hannon.

You will recall that in the *Legislative Manual*—perhaps you have not read it yet—we have advocated the adoption of this plan of having county societies pass resolutions on important legislation and instructing their secretaries to send copies to their local legislators I feel that the legislators in Albany think of the medical profession as purely 22,000 votes I don't think they consider that we have a great deal of influence on public opinion, or that at least we are too lazy or too indifferent to exercise it. I feel if some of the county societies, when they receive information regarding important legislation, will carry on this procedure, we will exercise a direct influence on legislation in Albany

The podiatry legislation was another thing that came from the House of Delegates, a difficult problem When this resolution was referred to the Council protesting about podiatry legislation, the bill had already passed It had been signed by the Governor and is in force Our feeling is that to attempt to do anything about the podiatry law will only weaken our position in regard to other important legislative matters

It was voted that the Council expresses *approval* of the Legislative Committee's recommendation not to do anything regarding podiatry legislation unless a new bill is introduced

The question on the Lien Law, another mandate from the House of Delegates, was brought up at our county society and it was decided by your Legislation Committee to introduce the 1938 bill with changes that have been suggested. As you recall, the lien bill gives the physician a lien on judgments that before we have not had. Our county society has already passed a resolution favoring such a lien bill. It will be sent to our two legislators, but I am not sure just how that will work in the Legislature I think other professions are protected, but the medical profession is not—a crying shame!

There is also the question of another section to amend the law concerning group practice or partnership This was referred to the Council by the House of Delegates for action before the 1949 legislative session Lest there be criticism of the Legislative Committee and the Council for not taking decisive action in this matter, I believe it will be important that we discuss what has taken place regarding this proposed legislation and the reason for not attempting legislation at this time

There has been in this partnership legislation a great deal of conflicting and controversial opinion by influential groups, and our feeling is that this matter should be studied before we attempt to have introduced legislation which might be ill-founded and may meet with tremendous resistance

I am going to ask Dr Hannon if he will outline briefly the problem we have with this particular question.

Dr Hannon "The proposal is that we have amended those sections of the law that were passed in 1947, the so-called Milmoe-Griffith Bills, which were for the benefit of the Health Insurance Plan of New York City

We have had many discussions on this I have talked to Mr Clearwater and Mr Martin The general opinion is that unless we have a strong argument we will meet with defeat, which will just strengthen the present law It will be rather difficult, in view of the support that those bills had from many members of the medical profession in their passage, to get sufficient united support from all of the medical profession to make our attempts successful

This same matter is being considered by the Planning Committee, and they have several problems along the same line"

Dr Holcomb "I would perhaps, as all committees do when their hands are tied, look for support. My feeling would be that, if the Council could recommend that the Legislative Committee with the Planning Committee or other interested groups

should study this question further, in an attempt to have introduced satisfactory legislation that might have some possible chance of passing, it might be of help, before we get our next spanking from the House of Delegates I am not seeking an out, but I think you all realize that when we are confronted with insoluble problems, we simply wish to have the concurrence and help of the Council in carrying on further study before we can have introduced such legislation.

I would like to ask at this time that a motion be made that the matter of group practice, partnership, etc , be subjected to further study, because we are not able to initiate such legislation at this time "

It was voted that the matter of group practice, partnership, etc , be subjected to further study as it is not feasible to have legislation regarding it initiated at this time

The next matter is the question of Sections 116 and 117 pertaining to bills making x-ray diagnosis the practice of medicine, also pathology, physical therapy, and anesthesiology Our feeling in the Committee, after a long discussion on this matter, was that we did not seem to be getting anywhere You have four divergent groups, four groups that have different ideas, and we are asking for more time to confer with each one of these groups and get an expression of opinion as to the definite legislation that they wish to have introduced—the type of legislation

Our next matter is another resolution about the title of "Doctor" appended to your name, in your letters, and making it mandatory that that be applied on stationery, signs, or something of that kind The Legislative Committee felt that this should have further study as well, because it has so many implications

As regards the report of the study on the Domestic Relations Law, we were asked to have introduced a bill to shorten the period of time for the premarital blood test At the present time persons must obtain a license within thirty days after the serologic examination and physical examination Then they have sixty days in which to use the license That is a total of ninety days The suggestion was to cut that down to fifty-five days Studies were made of two hundred and fifty people, and it was found that 93 per cent were married within four weeks of the date of their physical examination, and about 55 per cent were married within two weeks Senator Desmond and the New York City Department of Health are considering again the introduction of such a bill Senator Desmond in a letter stated that, in light of the views expressed by well-informed doctors, it is probably not desirable that such a bill be introduced Our Legislative Committee decided to recommend to the Council that such legislation be not introduced this year

We had another question that was extremely important—making it compulsory to use iodized salt in New York State. We had several communications about the importance and uselessness of iodized salt. As a result it was decided that medical evidence does not warrant the passage of legislation making iodized salt mandatory in this State

Mr President, I ask approval of our recommendations.

It was voted that the recommendations of the Legislative Committee be *approved*

Constitution and Bylaws.—Mr Clearwater reported that the Ontario County Society proposed bylaws had been considered However, these included provision for associate members who would not be members of the State Society

After discussion, *it was voted* that this matter be laid over for a month, for further discussion and report

Mr Clearwater read the following correspondence

MEDICAL SOCIETY OF THE COUNTY OF ULSTER

My dear Dr Anderton

We have a problem to solve here in our County which you will be able to understand after reading the carbon copy of my letter to the Attorney General at Albany

Am also enclosing the reply from the Attorney General's office We do not have a paid attorney for our society and it was suggested that perhaps the Attorney for the State Society may take the matter up for us and let us know what the decision was in the case cited. If this cannot be done please advise what our next step should be

Thanking you in advance, I remain

Yours very truly
F H Voss, M D F A C P
Secretary

This is the letter to the Attorney General of the State of New York, dated November 16, 1948

My dear Sir

At the Comitia Minora (Executive Committee) meeting of the Medical Society of the County of Ulster held November 12th I was directed to address a letter asking your opinion on the following matter

The Comitia Minora desires to know if a physician, now a member is found to be enrolled in a political party which advocates the overthrow of the Constitution of the United States, and holds a membership card, proven by the U S F B I whether or not the said County Society may expel or cancel his membership?

Our Bylaws state that a physician must be a citizen and qualified by the N Y State Board of Regents

Respectfully submitted
F H. Voss M D F A C P
Secretary

The Attorney General's Assistant, Ruth Kessler Toch, replied to Dr Voss, November 19, 1948, as follows

I have your letter of November 16 1948.

Since the Attorney General is authorized to advise only officials and departments of the State government I regret that I cannot give you an opinion upon your problem I suggest that a private attorney could advise you on the scope of your disciplinary jurisdiction as provided in the Membership Corporation Law and the constitution and bylaws of your society

Informally and unofficially I call your attention to the case of *Ewald v Medical Society of the County of New York* 144 App Div 82 which contains some discussion on the subject.

Mr Clearwater That Ewald case is a general case that provides that medical societies have powers to discipline members, but this case is different There is this power to discipline a man who indulged in some real medical fraud, but that is not helpful to this particular problem.

One thing I noted is that they refer to a man who advocates the overthrow of the Constitution of the United States That is a little different from the overthrow of the government of the United States I don't know whether that is exactly what they intended to say, but it strikes me that this is a matter that could very well be referred to the Constitution and Bylaws Committee, to see if the State Society wishes to take action which might be a precedent in future matters of the same sort

After discussion, *it was voted* to refer this matter to the Committee on Constitution and Bylaws.

Supplementing this report, Dr Reuling stated that the Council at the meeting last month voted that

the matter of partial payment of county society dues and State assessment be referred to the Committee on Constitution and Bylaws. There has been no meeting of the Committee, and this is simply a report of the chairman to the effect that it is his feeling that our bylaws are perfectly clear in the matter May I read Bylaws, Chapter I, Section 1

> The active members shall be all active members in good standing of the component County Medical Societies. A copy of the roster of such members certified to be correct by the secretary of such County Society shall be evidence of the right of the members whose names appear therein to membership in this Society No member who has been dropped from the roll of a component County Society by reason of failure to pay dues shall be accepted by another Society except by regular transfer after reinstatement in the original Society

Section 2 The term "good standing" is hereby defined as

> (a) A member is in good standing when his dues to his County Society and the assessment of the State Society have been paid when they are due and payable. The dues year shall coincide with the fiscal year January 1 to December 31 of each year
>
> (b) A member whose dues and assessments are unpaid after May 31 of any current year is not in good standing He is in arrears for dues. He has lost his right to malpractice defense by Counsel of the Medical Society of the State of New York for any acts upon which suit may be predicated during the period of his arrears. This last is not recoverable, even when he becomes reinstated. Immediately upon payment of dues during the current year, his right to malpractice defense by Counsel of the Medical Society of the State of New York shall be restored from that date.

It is the opinion of the chairman of the Committee that the matter is entirely covered in our present bylaws and needs no further action.

It was voted that, as the matter is entirely covered in the present bylaws, no further action was needed.

Convention.—A letter from Dr Ingegno, chairman of the Subcommittee on Scientific Program of the Council Committee on Convention, regarding payment of expenses of certain speakers, was referred to the Convention Committee.

Economics.—Mr Farrell, director of the Bureau of Medical Care Insurance, made the following report

Mr Farrell attended the annual meeting of County Society Secretaries in Albany, November 4

November 15—Your Director conferred with the Executive Director of Genesee Valley Medical Care, Inc, Rochester, on the proposed State-wide contract He spoke to the senior medical students of Syracuse University College of Medicine, November 16, on "Voluntary Medical Care Plans and the Effect They Will Have on Economics in Medical Practice"

November 18—Mr Farrell attended the Middle Atlantic States Regional Conference of the Council on Medical Service of the American Medical Association in Philadelphia.

Mr Farrell was present at the Interim Session of the A.M.A House of Delegates in St. Louis, November 30 to December 3 Prior to the opening of the House, Mr Farrell appeared before the Council on Medical Service, November 29, and spoke regarding the position of the Council of the State Society on the proposals for Blue Cross-Blue Shield Association and Blue Cross-Blue Shield Health Service, Inc.

On November 30 by invitation, Mr Farrell attended a meeting of the State Society delegates to discuss the proposals for the Blue Cross-Blue Shield Association and the national insurance corporation

Mr Farrell was present December 1 at a meeting of the Reference Committee on Report of the Council on Medical Service Attached is a supplementary report of the Council on Medical Service on the A.M C P proposals to form a national insurance company which was unanimously adopted by the House.

December 2—Mr Farrell conferred with Dr Wertz, chairman of the Committee on Medical Service, and Dr Aaron, chairman of the Subcommittee on Medical Expense Insurance of the Committee on Economics in Buffalo, relative to the A.M.A. Interim meeting

SUPPLEMENTAL REPORT ON A.M.C P PROPOSAL TO FORM A NATIONAL INSURANCE COMPANY

I *Decision Up to the House of Delegates.*—Decision as to whether or not it is desirable to form a national insurance company or a reciprocal enrolling agency to supplement the present prepayment program is now before the House of Delegates for action at this present session The Council on Medical Service has accomplished the principal purpose of its preliminary report of October 2 1948 namely guarding and guaranteeing the right of the House of Delegates to speak for American medicine on this important subject. (A copy of the October 2 report, approved by the Board of Trustees was sent to each member of the House previous to this meeting.) The right of the House of Delegates to determine its own and medicine s course of action was sustained by representatives of the Council on Medical Service and representatives of various state plans at the A.M C.P meeting at French Lick, Indiana in October

II. *Physicians Should Study Proposal.*—The second purpose of the October 2 statement of the Council was to make it possible for physicians throughout America to have an opportunity to study thoroughly the proposal for a national insurance company

Although many state and county medical societies and groups have considered the insurance proposal and both proponents and opponents have been active in presenting their claims the medical profession is not yet fully informed in regard to the scope of the proposal. Less than three months ago the printed proposal of the Blue Cross-A.M.C P insurance company was distributed to the Blue Cross and Blue Shield plans. The printed proposal was not sent to all state and county medical societies at that time, and, therefore few state medical organizations have had the opportunity to take action.

III. *An Enrollment Agency Still Should Be Considered.*—At the June 19 meeting of representatives of state and territorial medical associations, it was evident that more complete agreement could be reached by the profession for the development of a national enrollment agency than for the formation of a national insurance company The Council reported this fact to the House of Delegates at its Annual Meeting in Chicago in June, 1948.

Sufficient detailed, concrete evidence has not yet been presented therefore it is not possible to rule out further consideration of an enrollment agency at this time. The Council is of the opinion that an enrollment agency, if it received the wholehearted support of the officers of A.M C.P would gain the acclaim of a great majority of physicians and not raise the doubts and raise the repercussions resulting from the present proposal.

IV *Bill of Particulars.*—Proponents claim a national insurance company is necessary to underwrite national accounts. In answer to a request for specific information concerning these accounts the Council received the following letter from Dr Hawley

> I have just received a letter from Mr Frank Van Dyk, manager of the National Enrollment Division of Blue Cross. When I requested this information from him, I also asked him to send it to you but, in case he has not, I am furnishing you a summary
>
> In the files of the National Enrollment office are recorded 1 955 national employers. We do not believe this *list to be complete.*
>
> Within the past two or three years Blue Cross has competed in the bidding for the coverage of 22 national employers who have a total of 214,450 employes, without success These have all chosen commercial insurance instead of nonprofit.
>
> In the same period Blue Cross has lost 42 accounts of national employers which they had previously had, and these accounts total 456 800 employes.

A statement from Mr Van Dyk has not been received and the Council is of the opinion that the data so far supplied is inadequate and hence suggests that the House should receive the answers to the questions set forth in the Bill of

Particulars before arriving at a decision. (A copy of the Bill of Particulars is attached, see Addenda 1.)

V *Alternate Proposal*.—The Council suggests that the House give consideration to further study of this entire subject by some impartial group such as the Brookings Institution.

VI. *Findings of Council*.—The Council is making independent inquiries relative to demands for national contracts (Findings of the Council to date appear in Addenda 2.)

The Council reminds the House that the Council's promotion of prepayment plans predates the activation of A.M.C.P. A M C P has been in operation only since December, 1946.

The cumulative experience and data pertaining to the individual plans together with that of A M C P are not yet sufficient to warrant the inauguration of such an irrevocable step as contemplated in the *A.M C P* proposal.

The Council is convinced that the primary strength of the voluntary plans lies in their flexibility. The present plans are meeting local needs for which they were developed. This is evidenced by the acceptance of these plans by the public. The Council is further convinced that the A M C P proposal would have an adverse effect upon the autonomy of the local plans.

VII. *Political Phase.*—The whole subject must be considered in the light of two national developments which in a way offset each other. (1) The re-election of President Truman with his program for compulsory sickness insurance. According to adherents of the *A M C P* plan this strengthens their belief that the creation of a national insurance company is now obligatory to further the voluntary prepayment movement and thereby offset socialized medicine; and (2) The proceedings of the Department of Justice against medical organizations in Oregon and California and rumored investigations elsewhere. This should be a warning to those who propose a national insurance company involving the present state and county medical society plans in interstate business, thereby making them vulnerable to government prosecution.

VIII. *Conclusion*.—In conclusion the Council points up the fact that in its opinion neither the election results nor demands by any group nor the fact that Blue Cross is going ahead with its own insurance company regardless of A.M.A. actions, has materially changed the fundamental principles and philosophy expressed by the Council in its statement of October 2.

It does believe that whether or not the House decides to approve a national insurance company that clarification of the functions and relations of A.M.A. and the A.M C P is vital to the future progress of the voluntary prepayment movement in America. The Council believes that a definite statement of the House delineating the functions of A M.C P as a trade organization which it was set up to be and of the Council as the policy making body is essential to a smooth-running combination to moment and impel the voluntary prepayment health movement which is so vital in the battle against socialized medicine. Hence the Council recommends that the House of Delegates

1. Approve the formation of a national enrollment agency and disapprove the proposal for the formation of a national insurance company.
2. Approve the statement delineating the field of operation of the Council and *A.M C P which was* presented to the Board of Trustees in December 1946 and approved by the Board but not approved by the A M C P Commission. (Copy is attached Addenda 3.)
3. Recommend that A.M C P make necessary changes in its Constitution and Bylaws which would take A.M C P out of the policy making field.
4. Reaffirm the Council's authority to promote the voluntary prepayment plan program in America.

ADDENDA 1.—BILL OF PARTICULARS IN REGARD TO NATIONAL ENROLLMENT

Those who advocate a national Blue Cross-Blue Shield insurance company (Blue Cross-Blue Shield Health Service Inc.) have made general statements that hundreds of companies and groups demand health coverage on a national, rather than a state or local basis. The Council on Medical Service believes that specific information should be made available to support these general claims.

Proponents for Proposals for the Blue Cross Blue Shield Association and Blue Cross-Blue Shield Health Service Inc have stated repeatedly that these organizational structures are necessary. They claim they are necessary for two reasons first, in order to bid successfully for the enrollment of employes of national employers and second to conserve and continue to service those national accounts which are now enrolled.

National Accounts are said to be those firms which have groups of employes in areas not served by a single plan.

This may be an unsatisfactory definition, but nevertheless it is used in the proposals.

There are many medical and nonmedical people (including some who have had the most extensive and comprehensive experience with prepayment medical care plans) who do not believe the agencies to be created by these proposals are necessary.

There are others who believe that a national enrollment agency might be desirable in order to assist in enrolling employes who may reside in areas served by more than one plan. Those in this category state that some enrolling agency other than an insurance company could coordinate enrolling and servicing activities and still retain the autonomy of state and local plans.

When literally interpreted these proposals are far reaching and constitute great concentration of corporate powers as well as powers to determine professional and other policies.

Before any further efforts are made toward forming either the organization called for in the proposals or an enrolling agency to which local plans could subscribe on a voluntary basis it seems that certain information is desirable. Documentary evidence is considered necessary in order to formulate sound planning.

The answers to the following items are minimal in determining a course of action.

1. Names and number of national accounts which now have their employes enrolled in Blue Cross Plans and which will discontinue such enrollment in the absence of the formation of Blue Cross-Blue Shield Health Service, Inc.
2. Number of employes and the number of dependents who will be affected by Number 1.
3. Names and number of national accounts which now have their employes enrolled in member *A.M C P* plans and who will discontinue such enrollment in the absence of the formation of Blue Cross Blue Shield Health Service Inc.
4. Number of employes and the number of dependents who will be affected under Number 3.
5. Names and number of national accounts which do not now have their employes enrolled in Blue Cross plans but which would enroll their employes if Blue Cross Blue Shield Health Service Inc became operative.
6. Number of employes and number of dependents who would be affected under Number 5.
7. Names and number of national accounts which do not now have their employes enrolled in member A.M C P plans but which would enroll their employes if Blue Cross-Blue Shield Health Service Inc became an operating insurance company.
8. Number of employes and number of dependents who would be affected by Number 7.
9. Number and names of national accounts which demand that all benefits (surgical medical and/or hospital) for employes shall be uniform regardless of the residence of the employe.
10. Number of employes and number of dependents involved in Number 9.

All of the above items involve primarily the attitudes of employers since the majority of such coverages are made available to employes by virtue of employer cooperation and in most cases employer contribution toward the costs.

Not so many years ago, the employer (or a committee representing management only) decided what, if any, types of social insurance benefits the employes would be eligible to receive. Management selected the plan or plans determined the amount to be contributed by the employer and announced the plan or plans and the net costs to the eligible employes. The employes were then free to participate or not participate as they wished.

More recently many of these employe benefits have become the subject of negotiation between management and labor. Sometimes the negotiations are carried on by a committee representing both labor and management. The labor members of such committees are selected by the employes themselves. In other cases unions (representing union leaders rather than union members) make specific demands relative to insurance benefits and employer contributions.

In addition to getting specific data on the ten above items it might be well to attempt to secure similar information with regard to employe and union demands.

To obtain expressions of the reactions of management and employers, it is suggested that the following agencies be contacted: United States Chamber of Commerce American Management Association, Industrial Relations Association, and the Federation of Employee Benefit Associations. As some of these sources are contacted, it is probable that many other valuable sources may be discovered and explored.

In order to make any undertaking complete factual data should also be requested from all recognized labor and employe organizations which are interested in the problems under consideration.

ADDENDA 2.—FINDINGS OF THE COUNCIL TO DATE

In addition to inquiries directed to A M C P the Council is exploring other sources of information relative to National Accounts.

Some of the organizations contacted include the Industrial Relations Association the United States Chamber of Commerce and certain insurance companies and associations. Time has not permitted a complete or thorough study of all possible sources of information.

[Continued from page 426]

To date, replies to inquiries seeking specific data indicate there is no uniform pattern nor a uniform demand for social insurance benefits.

Some national employers have indicated a desire for uniform social insurance benefits for all employes, regardless of residence for the following reasons

1 Lower costs
2 The company transfers many of its personnel from branch to branch, and where uniform coverage is in effect, such benefits are not disturbed and
3 Many company employes and executives travel extensively These employes and executives know they are entitled to stipulated benefits regardless of where they may be when these benefits are needed

One large employer indicated that it was company policy to deal with insurance companies rather than Blue Cross. This company established this policy several years ago because the company did not believe in the avowed policy of Blue Cross—i.e. service benefits. This company operates in several areas and the branches are more or less autonomous The branches are permitted to negotiate their own social insurance programs.

Insurance companies which operate in all states are in a position to underwrite uniform benefits for employes of national employers Certain information received from one large insurance company indicates that it receives bids from employers to underwrite varying benefits for different employes

Recently an insurance association chose 25 representative business firms to determine the existence of uniformity of benefits pertaining to national accounts. Of these 25 firms, twelve companies employing some 426 000 persons had nation wide surgical benefit programs. The remaining thirteen firms employing over 2 160 000 persons did not have a nation-wide surgical benefit program.

A recent publication entitled *The Experience of 123 Companies Having Employee Benefit Plans* published by the Dartnell Corporation also indicates a lack of uniformity of benefits among the corporations included in that study.

The Council on Medical Service has received numerous letters and telegrams stating opposition to the Blue Cross A M C P proposal for a national insurance company and copies of resolutions from several county and state medical societies expressing disapproval of the proposal.

Some resolutions have approved the October 2 statement of the Council and the Board of Trustees. Other resolutions have urged serious consideration of the proposal by the House of Delegates of the A M A before any action is taken

One resolution encouraged the formation of a National Agency for Voluntary Health Service Plans, but did not approve the specific proposal under consideration.

There is a wide difference between the total enrollment of most Blue Cross plans and the total enrollment of coordinated prepayment medical care plans

In the aggregate Blue Cross enrollment exceeded coordinated prepayment medical care plan enrollment by approximately 18,000 000 on June 30 1948.

ADDENDA 3 —RECOMMENDATIONS OF THE COUNCIL ON MEDICAL SERVICE WITH REGARD TO A.M C.P

The A M C P —An organization of the plans themselves. Primarily interested in the internal problems of organization and administration. Its function might well be to assist plan managers in specific problems concerned with the details of actual plan operation and cooperation with the Council in the over all program.

Some of the subjects and problems with which A.M.C P should be primarily concerned are

1 Physical setup of plan offices and service equipment.
2 Personnel setup of plans
3 Standardization of methods or systems of keeping actuarial data on plan experience
4. Standardization of forms used by plans.
5 Uniformity of contracts and provisions for reciprocity among plans.
6 Methods and media to be employed in selling, etc.

The Council —The Council should assume the major role of promoter director and coordinator on a nation wide basis. Promotion includes

1 Urging all areas (through the state and county medical societies) to make some sort of adequate program of prepayment available to the public
2 Providing consultation and field service to the state and county medical societies including A.M C P in this field service where needed.
3 Assisting the state and county medical societies in educating the doctors (and the public) to the need for prepayment programs.
4. Providing publishable data and information on all of the plans to state and county medical societies to national publications groups and conferences and for A.M.A. publications.
5 Striving for a basis of cooperation among all voluntary agencies.

Direction includes

1 Over all studies on growth specific contract provisions (x ray etc) enrollment practices and other items in which over all suggestions and exchanges of ideas might be applicable
2 Setting of standards for plans and issuing the Seal of Acceptance ' including nation wide recognition of the Seal as the emblem of doctor-sponsored medical care plans.
3 Studying other programs of medical service including indigent care contract practice cooperatives, etc to evaluate them and determine their place if any, in the A M A. medical care program.

Coordination includes

1 Providing a clearing house for ideas and data including central file on factual information
2 Assisting A.M C P in selling its recommendation to the doctors and the plans.

Approved by the Board of Trustees December, 1946.

Dr Wertz, chairman, supplemented this report by stating that in spite of the action of the American Medical Association, the Blue Cross people are having a meeting in Chicago to consider the formation of a national health insurance company

Also the following letter was read and discussed

December 6 1948

Dr L. Howard Schriver President
Associated Medical Care Plans
550 South Wells Street
Chicago 6, Illinois

Dear Doctor Schriver

At the Interim Meeting held in St. Louis last week the American Medical Association rejected certain Proposals presented by Associated Medical Care Plans for the organization of an insurance company to provide combined hospital and medical coverage on a national basis. At the same time the A.M.A. reaffirmed its belief in voluntary prepaid medical care insurance conducted on the local level and pledged its support to every state medical society sponsoring medical care plans

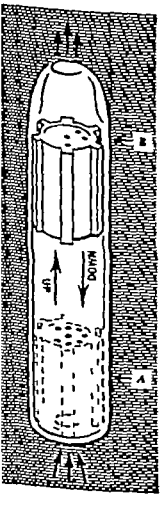
It was our understanding that A.M C P would abide by the decision of the A.M A. in this matter Yet, the *New York Times* of December 3 1948 states

> Despite the A.M.A. s reaffirmation of its stand against socialized medicine and any form of compulsory sickness insurance the Blue Cross-Blue Shield Commission announced it would proceed with its plans to set up a national insurance company a nation wide, nonprofit organization to combat Federal plans. Dr Paul R. Hawley executive officer of the commission said the commission would meet December 9 in Chicago to lay the groundwork for a stock company to sell voluntary medical and hospital insurance in a package deal through Blue Cross units with the cooperation of Blue Shield organizations Blue Cross units now prepay hospital insurance Blue Shield is for the doctors fees.

As Blue Shield Commissioners from District No 2 may we protest the foregoing statement, call attention to the fact It was made without our knowledge or consent, and that it is contrary to the sentiments of the District.

We do not question the right of the Blue Cross Commission to arrange for hospital coverage on a national basis but we think participation of Blue Shield representatives in such a plan in order to provide medical coverage in a single package could rightfully be construed as a circumvention of the wishes of the medical profession expressed by the A.M A hence a breach of faith on the part of A M C P

Bearing in mind the recent rejection of a national medical plan it would be a great mistake to try to force doctors to take part in a national hospital plan (including medical services) for no plan hospital or medical can succeed without the free and wholehearted cooperation of the medical profession. This cannot be obtained through subterfuge or by defiance of the A M.A.



Therefore in order not to forfeit A.M A support of A.M C P and to assure cooperation between hospitals and the medical profession we suggest that the Blue Cross Commission be requested to postpone action on the matter of national hospital coverage pending an early joint meeting of the full membership of both Commissions If this is not agreeable to the Blue Cross Commission we recommend the Blue Shield Commissioners withdraw and have the meeting of December 9 go on record as being held by the Blue Cross Commission for hospital insurance purposes only We are aware that some plan executives represent both hospitals and medicine but in the present situation we believe it wise for them to act for hospitals alone.

May we request that you make these views known to our

colleagues on the Blue Shield Commission Some idea of their reactions, also your own, would be greatly appreciated.

Sincerely yours
JOHN F MCCORMACK
Commissioner District No 2
FREDERIC E ELLIOTT M D
Commissioner District No 2

No action was taken

Dr Wertz, chairman, reported further that Governor Dewey was going to hold a hearing on sickness disability insurance legislation, and he felt that the Society should be represented

It was voted that the Council request Dr Wertz to represent the Medical Society of the State of New York at the proposed hearing regarding sickness insurance

Malpractice Insurance and Defense Board.—The Council approved the recommendation of the Malpractice Insurance and Defense Board that continuation of insurance be denied a certain member

Planning Committee for Medical Policies—Dr Kenney, chairman, reported that the Planning Committee at a recent meeting considered three major problems, the reorganization of the district branches, the relationship of hospitals to the practice of medicine, and the inclusion of medical services in hospital insurance contracts The Committee also discussed group practice

Publication Committee—Dr Kosmak, chairman, reported verbally as follows

The Publication Committee had its meeting yesterday afternoon with full attendance We were also favored by the presence of Dr Simpson

A number of routine matters were discussed, including that of a possible change in the format of the JOURNAL and its enlargement

After discussion, the Council *voted* to approve the recommended inclusion of the Union Health Center in the 1949 *Directory*

Public Health and Education—The report as distributed with the agenda is as follows

Activities of the Chairman

November 18—In New York City conferred with Dr Leonard Greenburg, director of the DIVISION of Industrial Hygiene and Safety Standards of the New York State Department of Labor and Chairman of the Study Committee on Industrial Health

November 19—Your chairman spoke on the subject "State Medical Society BCG Program" at the fall meeting of the Brooklyn Tuberculosis and Health Association in Brooklyn

November 30, December 1 and 2—Your chairman attended the Interim Session of the House of Delegates of the American Medical Association

December 7—In New York City attended the meeting of the Planning Committee

December 9—In New York City a meeting of the Council Committee on Public Health and Education and the Study Committee on Industrial Health was held Some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health and the City of New York Department of Health were present

Also on this day in New York City a meeting of the Council Committee on Public Health and Education and the chairmen of all of the Subcommittees was held. Also present were some of the officers of the Medical Society of the State of New York and representatives of the New York State Department of Health.

Subcommittee on Blood Banks—Lester J Unger, M D, chairman, reported that the Subcommittee on Blood Banks of the Council Committee on Public Health and Education of the Medical Society of the State of New York has held three meetings The first was in Albany on July 28, 1948 Present were representatives of the Council Committee on Public Health and Education, officers of the Medical Society of the State of New York, of the Subcommittee on Blood Banks, and representatives of the New York State Department of Health, and the City of New York Department of Health A free discussion of the blood bank problems ensued, and all of those who attended expressed their views A representative of the State Department of Health presented recommendations for a State-wide blood bank program under the auspices of the New York State Department of Health

A meeting with representatives of the American National Red Cross took place on August 27, 1948, in New York Representatives of the same groups present at the first meeting were also present and representatives of the American National Red Cross, the North Atlantic Headquarters and the Rochester Regional Blood Bank attended At this meeting the representatives of the American National Red Cross discussed the policies of the National Blood Donor Program

The third meeting was held September 16, 1948, in New York. Those present were Dr John J Masterson, Dr Morris Maslon, Dr Eugene L Lozner, and Dr Lester J Unger Present as guests were Dr Ralph T B Todd, Dr I Jay Brightman of the New York State Department of Health, Dr Ernest I Stebbins and Dr G Foard McGinnes representing the American National Red Cross Dr Mitchell, because of illness, was unfortunately unable to attend. The purpose of this meeting was to explore the possibility of reconciling the differences between the policy of the Blood Program of the American National Red Cross and the so-called "proposed Westchester Plan" This was desirable because the official letter of our Society to the members appointed to this Committee stated that the resolution passed by the House of Delegates of the Medical Society of the State of New York on May 17, 1948, directed that your Subcommittee use as an example the "proposed Westchester Plan" This plan allocates certain duties to the American Red Cross

After considerable discussion it was asked whether or not any of the provisions of the so-called "proposed Westchester Plan" were acceptable to the American National Red Cross Dr McGinnes suggested that Dr Stebbins reply to this, and the latter informed your Committee that the "proposed Westchester Plan" was not acceptable, first, as a unit of the National Program of the American Red Cross, and second, that it was not entirely acceptable as a permissive program of the American Red Cross The following questions were submitted by Dr Todd for answer by the American National Red Cross

1 Is the fundamental philosophy of the American Red Cross Blood Bank Program to prepare for national emergency and civilian disaster?
(The answer was yes but with an added for civilians and when there was no disaster)
2 Does the A.R.C agree that the Civilian Blood Bank network be expanded sufficiently to accomplish this purpose?
3 Does the A.R.C agree to the deletion of the words free blood?
4. Will the A.R.C agree that all local publicity should

be subject to mutual agreement between the local Red Cross Chapter and the local medical society?

5 Does the A.R.C agree that the initial contact shall always be with the local medical society when a local blood bank program is contemplated by the A R.C ?

6 Will the A R.C agree to foster active program of conference with local blood bank officials on the best ways of securing integration with and improvement of existing facilities?

7 Will A R.C agree to adjudicate local disagreements at state and national levels?

8 Will A.R.C agree that their blood bank projects will not undermine in any way, existing blood banks?

9 Why is it that the A R.C will not recognize the so-called proposed Westchester Plan as a permissive program?

After discussion of the Committee's recommendations, *it was voted* that the Council grant Dr Mitchell permission to send the report of the Blood Bank Subcommittee to the county societies, who request information, as a study report, specifically stating that it is not the full and considered opinion of the State Society

Subcommittee on Mental Hygiene—S Bernard Wortis, M D , chairman, reports as follows

I would like to submit this report in connection with what has been happening with the New York State Mental Hygiene Advisory Council

The Subcommittee on Mental Hygiene of the Medical Society of the State of New York recommended to the Governor that an Advisory Mental Hygiene Council be appointed to work with the Commissioner of Mental Hygiene of the State of New York This Council was appointed and your chairman has been your representative on this committee

The first meeting of the Advisory Council was held on September 27, 1948, in Albany Present at the meeting were Dr Howard Potter, New York, Judge Collins, Nassau County, Dr Sharp, Buffalo, Miss Marion McBee, New York State Charities Aid, Dr Gorham, formerly professor of medicine, Albany Medical College, Mr Ralph King, State Welfare Agency, Dr J L Poole and Dr S Bernard Wortis, New York City

The agenda of the first meeting included (1) discussion of the function of the Council, (2) organization and meetings of the Council, (3) the work of the Council in relationship to Federal Health Projects, (4) consideration of the expansion of the educational program in mental hygiene by the State, (5) methods of approach and work with the medical profession, and (6) general hospital planning and legislation indicated

In addition, there is some general discussion given to problems of child guidance clinics, the State hospital building program, and also placed on the agenda was consideration of the better care of psychoneurotics, alcoholics, seniles juvenile delinquents, and mental defectives This first meeting was largely devoted to organization plans of the Council and several of the community service projects were reviewed and approved by the committee

A second meeting of the Council was held October 25, 1948, in New York City At this second meeting, there was consideration of general plans to be applied in the development of the New York State program under Federal funds and a consideration of recommendations to the Council concerning priorities for the granting of funds in various geographic areas of the State The main discussion at this meeting centered around the program of psychiatric care and setting up psychiatric services in general hospitals There was consideration of this problem under the problems of medical care, financing, and legislative requirements.

A third meeting is scheduled for November 29, 1948, in Albany and I will continue to keep the Committee informed of the work of the State Advisory Council

Postgraduate Instruction.—Postgraduate instruction is being given in the following counties Chenango, Clinton, Cortland, Jefferson, Nassau, Richmond, and Tioga

Postgraduate instruction has been completed in the following counties Fulton, Lewis, Monroe, Onondaga, Orange, Oswego, Schenectady, Schoharie, Sullivan, Tompkins, and Warren.

Dr Mitchell called the attention of the Council to a very attractive little magazine which is gotten out by the New York State Health Department called *The Health News*

Public Relations.—Dr Winslow, chairman, submitted the following report

Immediately following the November meeting of the Council at which Dr Arthur D Jaques of Lynbrook, New York, was nominated for the American Medical Association's Outstanding General Practitioner's Award, the Public Relations Bureau issued a news release and biographic material regarding Dr Jaques to the daily press and wire services and the weekly press in Nassau County All daily publications were furnished with photographs and the weekly papers with mats Further information was given to the *New York Herald Tribune* which resulted in a full column feature story

On November 15, copies of the commemorative booklet, *20,000 Years of Service*, were sent to all libraries in the State (335) Previously they had been mailed only to those libraries in the towns where fifty-year men lived

The manual for chairmen of legislative committees was completed, bound in a special cover, and mailed to 61 legislative chairmen throughout the State Additional copies were mailed to members of the Council and Board of Trustees and to executive secretaries of county societies Copies also are being sent to members of legislative committees as their names are received There have been a number of requests for copies of the manual from medical societies of other states

Mr Philip J Smith, newly appointed executive secretary of the Medical Society of the County of Richmond, visited the office of the Public Relations Bureau on November 19 for the purpose of determining the best manner of coordinating the work of his society with the State Society Members of the Public Relations Bureau staff spent considerable time with Mr Smith making him acquainted with various procedures

Following repeated difficulty in obtaining physicians to appear on public platforms, radio programs, etc , to support the medical profession's views in opposition to compulsory sickness insurance, a conference was arranged between Mr Barton Pevear, executive secretary of the Medical Society of the County of New York, and members of the Public Relations Bureau staff Mr Pevear reported that the New York County Society is preparing to organize an active Speakers' Bureau whose aim it will be to have available at all times doctors who are willing and able to represent the medical profession under such circumstances Preliminary plans were made to gather factual material and to make all the resources of the State Society available in assisting the inauguration and operation of this project It is planned to extend the same services to other counties as rapidly as they organize their speakers' bureaus

A request was received from Leo E Brown, executive assistant of the Medical Society of the State of Pennsylvania, to reprint the pamphlet *Dogs, Drugs and Doctors* Permission to reprint was granted with the understanding that credit would be given to the Medical Society of the State of New York

The Auxiliary booklet, *The Ladder*, was distributed to all members of the Council and Trustees, according to the Council resolution of November 11

The booklet, *Myth and Menace*, opposing the licensure of chiropractors, and a reprint of the booklet, *Medicine Men and Men of Medicine*, are on the press

During November, Mr Walsh spoke on legislation to the members of the Kings and Monroe County Auxiliaries He also attended three meetings of the Nassau County Speakers' Bureau and provided material and suggestions to both the Nassau and Monroe County Speakers' Bureaus

The following postgraduate sessions held under the auspices of the Committee on Public Health and Education were covered by releases to the press Alleghany, Jefferson, Lewis, Monroe, Nassau, Onondaga, Orange, Richmond, Schenectady, Schoharie, Sullivan, Tompkins, and Warren counties

Veterans Administration, Liaison with the — Dr Bauckus, president of the Veterans Medical Service Plan of New York, Inc , sent the following telegram, dated Buffalo, New York, December 8, 1948

> Dr Ethan Flagg Butler telephoned me today asking we continue contract until March 31 1949 He states this will give more time for headquarters to consider policies which were taken up at A M A meeting on Monday with Dr Magnuson I am in favor of doing this Please present to Council

It was *voted* that the Council *approve* continuation of the existing contract between Veterans Medical Service Plan of New York, Inc , and the United States Veterans Administration until March 31, 1949

War Memorial —Dr Anderton stated Dr Rooney requested him to report on account of his inability to be present, and state that letters and forms requesting proof for beneficiaries have been mailed Further action by the War Memorial Committee will take place as soon as replies have been received There are about sixty beneficiaries for the War Memorial Fund to be helped with their education

Woman's Auxiliary —Dr Beekman reported that there had been a meeting December 8, attended by Mrs Neptune and other members of the Board to discuss some of their problems on administration

Workmen's Compensation —Dr Kenney, chairman, reported verbally as follows

The activities of the Council Committee and the Bureau of Workmen's Compensation are proceeding in a rather happy way We are not settling all of the problems that are before us immediately, but the spirit of cooperation and effort seem to be improved judging from my observations as I go about the State, as I have been in the last few months

Last Friday in Buffalo, we had a meeting with the Conference Committee on Workmen's Compensation Problems which is a working group of the representatives of the county medical societies in the Eighth District of our State Society A meeting, with Miss Mary Donlon as chief speaker, was held last Friday night It was attended by the president of the Erie County Medical Society, Dr Bauckus, Dr Wertz of our Council, and by presidents, secretaries, and chairmen of the committees on workmen's compensation of these different county medical societies Some 25 or 30 people were there

It was an exceptional meeting Miss Donlon talked for a full hour She was asked a good many questions, and the whole spirit of the meeting was good and engendered a better feeling I am sure. A good many of the men met Miss Donlon informally after the meeting and sat down and talked with her about various problems that she could not cover during the meeting

The gist of Miss Donlon's paper and the chief thing she stressed was what she was pleased to call the "plus" services that doctors can render in workmen's compensation It is a subject upon which I have expressed myself in some remarks that I made around the district branches She feels that the doctor has a social service to render in workmen's compensation over and beyond the mere rendering of medical care and being remunerated for it She brought this out in a very pleasant way, and the attitude that she takes in this whole problem of workmen's compensation is that she is definitely against having anything happen which will lead to the breakdown of this social experiment in medical care She is with the Medical Society in that respect Her remarks got a very good press

I was accorded the privilege of speaking for some twenty minutes and discussed mostly the problems confronting the doctors and our own problems of acting as liaison between Miss Donlon and the group

I thought her reaction was very good to this meeting, and she expressed the hope, after the legislative session and the stress of work in Albany, of appearing before similar groups in other parts of the State to discuss mutual problems I think that is a feature in our relations that, if carried out, will be helpful to us

We had a meeting on Monday afternoon of this week of the Advisory Council to the Workmen's Compensation Board This meeting particularly was in reference to proposed legislation which the Labor Department is interested in We also discussed matters affecting the insurance carriers, particularly in regard to their increasing costs in meeting the problems of care to the injured workmen, both hospital and medical

Just a brief word in connection with the fee schedule This, as you know, has only been in existence about two months, and there are a great many problems of interpretation There is to be a meeting on December 13 with the chairman of the Board and the Advisory Council that drew up the fee schedule, on which the State Society is represented by Dr Van Etten and Dr Anderton Our director, Dr Kalish, has painstakingly prepared a very excellent brief of the complaints that have come in from all around the State and also matters that he has been able to detect himself in the law, which will come before that meeting

This new fee schedule is going to mean an increase of some ten million dollars a year in medical fees that the doctors of the State will receive over what they have been getting This increase is in addition to and beyond what the costs are for hospitals These costs have gone up so rapidly it is a matter of great concern and is under study at the moment with Miss Donlon I think she intends to try to have a bill introduced at this session of the Legislature giving her rather broad authority to adjust hospital fees to meet rising costs

Another thing for your information is that for

[Continued from page 434]

1948 there were over 800,000 new compensable cases in this State That gives you some idea of the vast size of the problem that is before all those concerned in the administration of workmen's compensation in this State

Miss Donlon brought out the fact that increasing costs of administering workmen's compensation both by her Board and by the carriers could be minimized if prompt reporting of accidents and compensable illness was done according to the legal requirements

It seemed to be the consensus of opinion of the Advisory Council in Buffalo the other afternoon that some kind of an official statement on the need for prompt reporting should be drawn up by the chairman of the Board and circulated to everybody concerned, the doctors, the carriers, and everybody else Miss Donlon accepted that suggestion with favor, and I think she will have such a statement prepared, but I would like to have you carry back to your county societies the word, which Dr Kaliski has as you know been continually stressing, that it is important to file the C-104 and C-4 forms promptly The C-104 form is usually the first notice of accident or compensable illness that the Workmen's Compensation Board or carrier gets The workman does not begin to receive his compensation until after the report is filed and processed That means that many times these injured workmen go on public welfare or temporary State care, pending the arrival of their workmen's compensation check Any tardiness is apt to increase costs tremendously

There is one thing I would like to mention, and that is next Monday, Tuesday, and Wednesday at the Association of the Bar of the City of New York, 42 West 44th Street, in Room 10, will be held the annual hearings of the Joint Legislative Committee on Industry and Labor, of which Mr Mailler is chairman Matters concerning workmen's compensation legislation will be discussed at four o'clock on Monday afternoon On Tuesday the hearings will be given over to rehabilitation and an inspection of clinics On Wednesday, I believe there will be further proposals regarding rehabilitation I would like to call to your attention the advisability of this Council's being represented in these various sections or somebody at least being there to present our views I propose to attend the meeting on Workmen's Compensation, and Dr Kaliski will certainly be there, but I thought maybe a representative from Dr Mitchell's committee or from some other source should attend

I will submit without reading this formal report from Dr Kaliski I don't think there is anything in it you can't read in due course

The report is as follows

REPORT OF COUNCIL COMMITTEE ON WORKMEN'S COMPENSATION

We have just been informed that the chairman of the Workmen's Compensation Board has called a meeting of the Advisory Committee on the new fee schedule to consider all inquiries and complaints concerning same at a meeting to be held on December 13 1948. This bureau has sent to the chairman our views suggestions, and recommendations concerning the fee schedule promulgated on September 1 1948 and there are certain recommendations concerning fees for all general practitioners promulgated on June 1 1947 Dr Nathan B Van Etten chairman of the Advisory Committee has informed us that he does not intend to remain a member of that Committee Dr W P Anderton is our representative on the Committee.

Examinations in diagnostic roentgenology and radiation therapy were held at the New York University Medical School on Tuesday November 30 1948. Three applicants from Queens County were examined. Two applicants failed to make a passing mark, and one passed for the D-2 rating.

We have received a communication from Dr E C Waterbury secretary of the Orange County Medical Society concerning an item which appears on page 7 of the fee schedule referring to the authorization of physicians by the chairman of the Workmen's Compensation Board. The statement referred to indicates that a physician who is desirous of rendering medical care shall first apply to and receive authorization from the chairman of the Workmen's Compensation Board. Dr Waterbury's inquiry asked whether this supplanted the provisions of the law which provide that a physician shall apply to the medical society in all counties having a population of less than one million while in the four counties having a population of one million or over, application is made and considered by the Medical Practice Committee. It was our opinion that while the authority to authorize physicians to render medical care under the Workmen's Compensation Law undoubtedly resides in the chairman of the Workmen's Compensation Board, the mechanism by which a physician may be authorized provides that he shall, in counties of less than one million population, first apply to the medical society which after examining the physician's qualifications shall make recommendations to the chairman of the Board upon which she acts. This procedure has not been changed nor has the law been modified. The entire matter will be drawn to the attention of the chairman at the proper time.

The routine work of the Department continues to be fairly heavy particularly in view of the uncertainty on the part of physicians as to the application of certain fees in the new fee schedule. It is our hope that the conference we have recommended for some time which will be held shortly, will result in prompt easement of the situation

Dr Kenney read the following letter from the Medical Society of the County of Albany

The General Practice Committee of the Medical Society of the County of Albany met in September and again in November It reviewed the new Medical Fee Schedule of the Workmen's Compensation Board issued under date of September 1 1948

It is obvious that the services of the general practitioner are not considered of great value. Unless approved for specialty rating his fees are covered in the first nine lines on page 11 first visit, office call including examination and report $3 50 office call $2 50 and hospital call, $2 50 and so forth the greatest fee being $15 as an assistant to a surgeon—and that only where there is no intern available The fee for office visits for compensation cases is not equal to the fees charged private patients in our county

The minimum fee schedule the general practitioner finds is also the maximum fee schedule—as interpreted by the insurance carriers The majority of the work done by the general practitioner is done at his office where he supplies the space equipment materials and nursing services in which case there are no hospital charges.

The Committee does not in any way wish to object to the fees allowed physicians with specialty ratings. It feels that they are justly entitled to additional fees for specialized services.

In reviewing the fee schedule for specialties on page 62 it is noted that complete office examination and written report $10 to $20 subsequent hospital or office visits $5 to $10 with pages of fees allowed for various procedures varying in amount from $10 to $300

Another comparison on page 21 reveals that the rates allowed for osteopaths are on the average, $1 00 more per visit than for the general practitioner This to say the least, is not flattering.

Records indicate that 75 to 80 per cent of the professional care rendered under workmen's compensation is still given by the general practitioner It is easy to understand how specialist fees may be raised leaving the rates of the general practitioner at their present minimum without greatly affecting the insurance payments for medical care. Yet, it is known that insurance rates to employers have been markedly increased in the last year There have also been increased benefits to the claimants. The Committee feels that somewhere along the line the general practitioner's interests must be considered.

Therefore the General Practitioners Committee of the Medical Society of the County of Albany recommends that:

1 The Society hereby recognize the inequities in the Medical Fee Schedule as they apply to the general practitioner

2 The Workmen's Compensation Committee be directed to review the fee schedule for the purpose of making recommendations for the correction of these inequities and that the Committee itself be enlarged to have greater representation by the general practitioner

3 The sentiment of this Society be reported to the Workmen's Compensation Committee of the Medical Society of the State of New York to Dr David J Kaliski director of the Bureau of Workmen's Compensation to Mary Donlon chairman of the Workmen's Compensation Board and a copy be sent to the secretary of each county society in the State of New York.

I would presume the Council will want to refer that in due course to this Committee, but I thought it should be read at this time

I would just like to comment on that, because the subject, long before I knew about this resolution, was discussed in Buffalo, too There seemed to be among the discussions from the practitioners there the opinion that too much stress has been put upon specialists and G P 's have been brushed over a little bit Dr O'Gorman talked quite a bit about it, as did Dr Dayton of Niagara, Dr Bell of Olean, and a number of others, and they were very critical of general practitioners' fees

This is the end of the year and the cooperation I have had from the director of the Bureau as evidenced by my personal experience and by the many comments and communications I have received from practitioners around the State upon the promptness and dispatch of his handling their complaints and his great assistance in getting their bills adjudicated is much appreciated I would like to record my thanks as chairman of the Committee for the cooperation he has tendered to me

The Chair referred the letter from Albany County on general practitioners care to the Workmen's Compensation Committee

Report of the Delegates to the 1948 Interim Session of the American Medical Association.—Dr Winslow presented the following report

The following delegates from the Medical Society of the State of New York attended the Interim Session of the House of Delegates of the American Medical Association at St Louis, Missouri, on November 30 and December 1, 1948 Leo F Simpson, Herbert H Bauckus, W P Anderton, Albert F R Andresen, Clarence G Bandler, James R Reuling, Floyd S Winslow, Ralph T B Todd, O W H Mitchell, Edward P Flood, W Guernsey Frey, Jr , John J Masterson, J Stanley Kenney, Thomas A McGoldrick, Andrew A. Eggston, Thomas M D'Angelo, Peter J Di Natale, George W Kosmak, Stephen R Monteith, Joseph P Henry, and Scott Lord Smith

Dr Monteith was a member of the Reference Committee on Rules and Order of Business, Dr Kosmak was chairman of the Reference Committee on Medical Education, Dr Andresen was on the Reference Committee on Hygiene and Public Health, Dr Winslow was chairman of a Reference Committee on Amendments to Constitution and Bylaws, Dr Flood was a member of the Reference Committee on Credentials, and Dr Kenney was chairman of the Reference Committee on Executive Session Also in attendance at the House of Delegates were Dr Chas Gordon Heyd, Dr Edward R Cunniffe, Dr Louis H. Bauer, Dr Frederic Elliott, Mr Dwight Anderson, Mr Frederic Miebach, Mr Thomas E Walsh, and Mr George P Farrell

On Tuesday, November 30, 1948, your delegates, the above-mentioned gentlemen, and Mr John McCormack, vice-president of United Medical Service, met from 5 05 until 6 P M Discussion was held regarding proposed amalgamation of Blue Cross and Blue Shield insurance plans in a national insurance corporation, and the proposed $25 per capita assessment of members of the American Medical Association The House of Delegates voted unfavorably upon a national insurance company but proposed a national recruitment office for hospital and medical care prepayment insurance The House also voted that an individual assessment of $25 each be levied by the Board of Trustees of the American Medical Association upon each member

Your delegates were diligent in their attendance at the meetings and competently represented our Society

American Medical Association Assessment.—Dr Anderton stated that a telegram had been received from Dr George F Lull, secretary of the American Medical Association, dated December 7, 1948, as follows

> The American Medical Association House of Delegates on December 1 created a committee to guide a nation wide plan of education on the progress of American medicine, the importance of the conservation of health and the advantages of the American system in securing a wide distribution of a high quality of medical care. As a first request of the Committee it is urged that you have a member of your Society preferably their family physician talk to your national legislators in order to inform them of the inferior type of medical care of the public that would result from the proposed compulsory sickness insurance program. The doctor who does the interviewing should have authoritative information on the subject. In order to better inform the person a booklet entitled, *Uncle Sam M.D* will be sent to every doctor in the United States as background material for informing the public

As a result of that telegram, at the request of a couple of the other gentlemen who were interested in it, he telephoned to Dr Lull and was told that the booklet had been presented at the Conference on Public Relations which met before the House of Delegates He stated that the booklet had gone to the printers but would not be ready for distribution for a couple of weeks

The second telegram, dated December 8, reads

> Recent interim session of House of Delegates unanimously decided to assess each member of the American Medical Association $25 You are requested to collect this assessment through your county units or any other way you desire Bill Association for any extra expense in connection with collection

After a lengthy discussion as to how the assessment should be collected and whether it were mandatory,

It was voted that the decision as to the best means of collecting the American Medical Association assessment of $25 be referred to a special committee composed of the officers and trustees to study and report at the next Council meeting

It was voted that the Medical Society of the State of New York request the American Medical Association to send a communication to each member of the American Medical Association explaining the purposes of the $25 assessment.

New Business

Appointments —The appointment by the president of Dr Elton R Dickson as a member of the Council Committee on Public Relations in place of Dr Dan Mellen was approved.

Two delicately balanced approaches to the problem of the menopause

Conestron oral therapy provides an especially flexible method of prescribing for the progressive physical and mental adjustments of the menopause. This method results in a minimum feeling of distress a maximum feeling of well-being for the patient *Conestron consists of water-soluble, estrogenic substances from natural sources Two strengths —0 6.25 mg and 1.25 mgs Bottles of 100 and 1000 tablets*

To supplement your advice and to enable your patients and their families to arrive at a better home adjustment during this difficult menopausal period the booklet *"Through One of Life's Progressive Changes"* is available to physicians, gratis, in distribution quantities

NECROLOGY

Ina Van Deerhoof Burt, M D , of Phelps, died at the age of eighty-one on January 2 Dr Burt, who received her medical degree from the Woman's Medical College of the New York Infirmary for Women and Children in 1895, was retired. She was a member of the New York State and Ontario County Medical Societies and the American Medical Association.

John Dugan, M D , eighty-two, died on November 12 Dr Dugan, a former resident of Geneva and Albion, was graduated from the University of Buffalo, School of Medicine, in 1896, and at the time of his death was a member of the New York State and Orleans County Medical Societies and the American Medical Association

Cyril Dustan, M.D , an authority on the health hazards in the handling of beryllium, a metallic element used in industry and in the development of atomic energy, died of a heart attack at his Brooklyn home on January 21 Dr Dustan, thirty-four years old, received his medical degree in 1943 at the Long Island College of Medicine He was a research associate at the Columbia University School of Public Health and, while at Columbia, had received the Fleischman Foundation medical scholarship His report on the medical aspects of beryllium poisoning, based on a year's study recently made for the Atomic Energy Commission, was almost complete, and he was preparing to leave to join the staff of the Tennessee Valley Authority to continue his research on beryllium He had been a member of the American Medical Association and the New York State and Kings County Medical Societies

Victor J Fingar, M D , forty-one years old, died at his West Ghent home on January 10 Dr Fingar, assistant medical director of the Equitable Life Assurance Society, was graduated from Albany Medical College in 1932 He served as a major in the Army Medical Corps in World War II and was attached to the Twelfth Air Force in North Africa and Italy Dr Fingar was formerly a general practioner in Brasher Falls, serving there also as a medical examiner for the Equitable Life Assurance Society

LeRoy Clarence Green, M D , died on December 29 at his home in Ashville He was seventy-seven years old Dr Green, a graduate of the University of Buffalo, School of Medicine, in 1895, interned at the Buffalo General Hospital and worked for a time under Dr Roswell Park, noted surgeon He had practiced in Chautauqua County for over half a century and was recently honored by the New York State Medical Society for his fifty years of service Dr Green practiced in Panama from 1897 to 1922, when he moved to Ashville He was a member of the New York State and Chautauqua County Medical Societies and the American Medical Association

Reuben Paul Higgins, M.D , sixty-eight, died on January 13 A physician in the town of Cortland, he received his medical degree from Johns Hopkins University, School of Medicine, in 1905 Dr Higgins served as chief ophthalmologist on the staff of the Cortland County Hospital. A former president and secretary of the Cortland County Medical Society, Dr Higgins was a diplomate of the American Board of Ophthalmology and a fellow of the American College of Surgeons He was also a member of the American Academy of Ophthalmology and Otolaryngology, the Central New York Eye, Ear, Nose and Throat Society, the American Medical Association, and the New York State and Cortland County Medical Societies

Louis Morgan Mooney, M.D , eighty-seven-year-old retired physician, died at his New York home on January 19 Dr Mooney was a graduate of the University and Bellevue Medical College in the year 1899 He had served as a consultant in gastroenterology at the Misericordia Hospital and had also served on the staffs of Polyclinic and St. Elizabeth's Hospitals Dr Mooney was a member of the New York State and County Medical Societies, the Celtic Medical Society, the Valentine Mott Medical Society, and the American Medical Association

Alfred Carlyle Prentice, M.D , of Endicott, for many years a practicing physician in New York City, died on January 14 at the age of seventy three Dr Prentice received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1901 and served his internship at Roosevelt Hospital

Dr Prentice was formerly associate surgeon at Vanderbilt Clinic and French Hospital and surgical lecturer at Polyclinic Hospital He had practiced in recent years in Endicott where he was an associate surgeon of Ideal Hospital He was also resident staff surgeon of Wilson Memorial Hospital, Johnson City

A former secretary of both the New York County Medical Society and the Physicians Mutual Aid Association, he was also a member of the New York State, Broome County, and Benjamin Rush Medical Societies, the Association of Military Surgeons, and was a member and former delegate of the American Medical Association He also served at one time as surgeon major of the Seventy-first Regiment, New York National Guard

Michael Napoleon Ratzan, M D , died at his home in Brooklyn on January 20 His age was sixty-seven He was graduated from the Medico-Chirurgical College of Philadelphia in 1906 He served on the staffs of Unity, Williamsburg, and Crown Heights Hospitals and was also active in research in cancer and diabetes Dr Ratzan founded the Brooklyn Cancer Society in 1928 and became its first president.

Alvah H Traver, M D , who had practiced medicine and surgery in Albany for more than fifty years, died at his home on January 22 He was seventy-three years old Dr Traver, a graduate of Albany Medical College in 1898, was chief of staff of the Child's Hospital, associate surgeon on the staff of Albany Hospital, and associate professor of surgery, Albany Medical College During the recent war he was an examining physician for selective service boards in upper New York State and had since served with the Veterans Administration Dr Traver was a fellow of the American College of Surgeons and also a member of the New York State and Albany County Medical Societies and the American Medical Association

Gilbert J Van der Smissen, M D , of the Bronx, died on January 20, 1949 He was seventy five years old Dr van der Smissen was graduated from the College of Physicians and Surgeons, Columbia University, in 1895 and interned at Lenox Hill Hospital He was a member of the New York State and Bronx County Medical Societies and the A M A

MEDICAL NEWS

$32,000,000 Architectural Program for NYU-Bellevue Medical Center

DETAILS of new definitive architectural plans for the new University section of the New York University-Bellevue Medical Center have been announced The new plans, which are the result of several years study, supersede the preliminary architectural plans announced earlier for the Center The University's new cost estimates for the Center are nearly twice those previously announced and are due both to the expansion of the Center's program and to the rise in prevailing construction costs during the past three years

The plans for the University section of the Medical Center include facilities for two medical schools, a 600-bed University Hospital designed primarily to serve patients in the middle-income brackets, and related clinics The project also includes provision for a program of postgraduate medical education which has been underwritten by an $8,000,000 grant from the Samuel H Kress Foundation, announced by the University Monday, January 10 In addition to the other facilities, the new University section of the Center will include space for the Institute of Rehabilitation, a hall of residence, and an alumni hall auditorium

MEETINGS

FUTURE

American College of Surgeons, New York and Brooklyn Fracture Committee

The fourteenth annual Fracture Day sponsored by the New York and Brooklyn Fracture Committee of the American College of Surgeons will be held Saturday, February 26, 1949, in the Einhorn Auditorium of the Lenox Hill Hospital, New York City

The program will open at 9·00 A.M , with the chairman's address by Dr Preston A. Wade Papers to be presented during the morning session include "A New Forceps for Grasping and Holding Bone Plates," Dr Meyer Stone, "Mode of Treatment of Fractured Neck of Femur in Two Children," Dr A. Della Pietra and Dr David M Bosworth, "Unusual Fracture Subluxations of the Shoulder," Dr Frederick Thompson and Dr Edward Winant, "The Misuse and Use of Metal for Internal Fixation of Fractures," Dr Edwin F Cave, "Use of Kuntscher Nail," Dr Harold A. Sofield, and "Observations on Results of Shoulder Cuff Repair," Dr Harrison McLaughlin and Dr Theodore Asherman

At the afternoon session, scheduled to begin at 2·00 P.M , Dr Robert H Kennedy will give a report of the National Fracture Committee proceedings Papers to be presented include "Blood Supply and Its Relation to Bone Healing and Nonunion," Dr Charles Burbank, "A Method for Further Evaluating Joint Injuries," Dr John Royal Moore, and "Results of Three-Year Follow-up on Fracture Dislocations of the Hip Joint," Dr George O Eaton.

Niagara Falls Academy of Medicine

The Third Annual Clinical Day of the Academy of Medicine of Niagara Falls will be held on March 5 at the Hotel Niagara, Niagara Falls.

The program of lectures to be presented during the day, starting at 9 30 A M , will include the following "Management of the Failing Heart," Dr Harry Gold, New York City, "The Value of X-ray Examination of the Pregnant Woman," Dr Paul A Bishop, Philadelphia, "The Role of Cervical Smear in General Medical Practice," Dr Ernest Ayre, Montreal, "The Use and Abuse of Sex Steroids," Dr L J Bailey, Detroit, "The Diagnosis of Angina Pectoris," Dr Lewis M Hurvtall, Boston, and "Low Back Pain," Dr Edward L. Compere, Chicago

New York Tuberculosis and Health Association

On March 8, the annual conference of the New York Tuberculosis and Health Association will be held at the Hotel Statler, New York City Authorities on the various phases of tuberculosis work, social hygiene, and health education will present papers at the morning, afternoon, and luncheon sessions Also, election of officers of the Tuberculosis Sanatorium Conference of Metropolitan New York, which will meet simultaneously, will be held at that time

National Society for the Prevention of Blindness

The theme of the three-day national conference of the National Society for the Prevention of Blindness will be "The Battle Against Blindness—The Next Forty Years " The meeting will be held at the Hotel New Yorker, New York City, on March 16, 17, and 18, and the subjects eye problems in middle life, eyes of children and adults, vision in industry, medical advances in sight conservation, and glaucoma—a community problem, will be discussed Details of the program may be obtained from the Society at 1790 Broadway, New York City

DIAGNOSING LUNG CANCER

Microscopic examination of sputum for cancer cells is a valuable aid in diagnosing cancer of the lung and pulmonary tuberculosis, according to three St Louis physicians, Drs Martin Bergmann, Burton A. Shatz, and I Jerome Flance

Differentiating between cancer and tuberculosis of the upper part of the lung has been extremely difficult. The only methods known for procuring tissue from the upper lobes for study under the microscope have undesirable aspects, and the areas are hard to visualize by means of x-rays Tubercle bacilli are frequently not seen in the sputum in cases of early pulmonary tuberculosis

Microscopic examination of sputum for cancerous cells gives a positive diagnosis in from 60 to 88 per cent of lung cancers and is an essentially desirable technic for discovering lesions of the upper lobes of the lungs, they report. Drs. Bergmann, Shatz, and Flance examined the sputum of 158 patients. In three cases a diagnosis of cancer was made by sputum examination at a time when the clinical diagnosis was tuberculosis or wavered between tuberculosis

Facts About Conception Control

Clinicians generally favor the use of an occlusive device supplemented by a sperm-immobilizing agent for optimum protection. However, authoritative studies have established that a high degree of protection is afforded by use of a jelly alone—provided that the jelly has rapid spermatocidal action together with adhesive and cohesive properties sufficient to provide a dependable barrier

When dependence must be placed on the "jelly alone" method, there is no better product available than "RAMSES"* Vaginal Jelly† because

1 It provides rapid spermatocidal action

2. It possesses dependable adhesive and cohesive properties—will not melt or run at body temperatures

3 Direct-color photographs show that it will occlude the cervix for ten hours

"RAMSES" Vaginal Jelly is available in regular and large-size tubes through all pharmacies

†Active ingredients Dodecaethyleneglycol Monolaurate 5%, Boric Acid 1% Alcohol 5%

*The word "RAMSES" is a registered trademark of Julius Schmid, Inc.

Have a Coke

The pause that refreshes

℞: only 2 or 3 drops

PRIVINE 0.05%

a distinguished nasal vasoconstrictor

HIGHLY POTENT Prompt, complete relief from nasal congestion and hypersecretion usually results from only 2 or 3 drops of Privine hydrochloride 0.05% Each application provides 2 to 6 hours of nasal comfort.

BLAND NON IRRITATING Privine is prepared in an isotonic aqueous solution buffered to a pH of 6.2 to 6.3 Artificial differences in osmotic pressure between solution and epithelium are avoided Thus, stinging and burning usually are absent.

Privine is generally free of systemic effect The occasional sedative effect that may be noted in infants and young children is usually due to gross overdosage Since there is no central nervous stimulation, Privine may be applied before retiring with no resultant interference with restful sleep

PRIVINE 0.05% in 1 ounce dropper bottles and 1 pint bottles 0.1% strength reserved for office procedures, in 1 pint bottles only

Old Way . . .

CURING RICKETS in the CLEFT of an ASH TREE

FOR many centuries,—and apparently down to the present time, even in this country—rickетic children have been passed through a cleft ash tree to cure them of their rickets, and thenceforth a sympathetic relationship was supposed to exist between them and the tree

Frazer* states that the ordinary mode of effecting the cure is to split a young ash sapling longitudinally for a few feet and pass the child, naked, either three times or three times three through the fissure at sunrise In the West of England, it is said the passage must be "against the sun" As soon as the ceremony is performed, the tree is bound tightly up and the fissure plastered over with mud or clay The belief is that just as the cleft in the tree will be healed, so the child s body will be healed, but that if the rift in the tree remains open, the deformity in the child will remain, too, and if the tree were to die, the death of the child would surely follow

*Frazer J G : The Golden Bough, vol 1, New York, Macmillan & Co., 1923

It is ironical that the practice of attempting to cure rickets by holding the child in the cleft of an ash tree was associated with the rising of the sun, the light of which we now know is in itself one of Nature s specifics.

New Way . . .

Preventing and Curing Rickets *with* OLEUM PERCOMORPHUM

NOWADAYS, the physician has at his command, Mead's Oleum Percomorphum a Council-Accepted vitamin D product which actually prevents and cures rickets, when given in proper dosage

Like other specifics for other diseases, larger dosage may be required for extreme cases It is safe to say that when used in the indicated dosage, Mead's Oleum Percomorphum is a specific in almost all cases of rickets, regardless of degree and duration Mead's Oleum Percomorphum because of its high vitamins A and D content is also useful in deficiency conditions such as tetany, osteomalacia and xerophthalmia.

* * *

COUNCIL-ACCEPTED

Oleum Percomorphum With Other Fish Liver Oils and Viosterol. Contains 60 000 vitamin A units and 8 500 vitamin D units per gram and is supplied in 10 c.c. and 50 c.c. bottles, and in bottles containing 50 and 250 capsules.

METANDREN LINGUETS

"...most economical
and also efficient way
of administering testosterone"[1]

Metandren Linguet therapy reduces the dosage of methyltes tosterone to approximately one half that required when this male sex hormone is ingested in tablet form

The Linguet is specially designed to dissolve *slowly* in the space between gum and cheek or under the tongue Thus Metandren Linguets are absorbed directly into the systemic circulation, largely avoiding inactivation in the gastrointestinal tract and the liver

- *Extensive literature on request*

More than just palatable...

this protein therapy is virtually *tasteless*

When 100 or more grams of protein *per day must be administered* to a critically ill or convalescent patient, taste and bulk are real problems

Essenamine is an essentially tasteless protein concentrate In virtually pure form, adaptable to any type of diet, Essenamine supplies large quantities of the *needed* amino acids. May be administered in milk, broths fruit and vegetable juices, meat loaf, baked goods, custards, ice cream, etc.

The required amount of Essenamine should be mixed with a small amount of cold water to form a smooth paste then add liquid or other ingredients gradually

ESSENAMINE®

high concentration of protein
***minimum* bulk**
tasteless bland unflavored

Supplied in 7½ and 14 oz. jars.

HEMABOLOIDS®

(Iron Proteinate)

FORMULAS

Hematinic Therapy to Meet Individual Requirements

Presenting iron in readily assimilable protein combination. Cause no puckering, griping, gastric upsets, discoloration of teeth, or constipation.

Palatable • Well Tolerated

Tablets **HEMABOLOIDS** with Folic Acid

Each tablet represents:	
Iron (as proteinate)	50 mg
Folic Acid	5 mg.

HEMABOLOIDS with Liver Concentrate

Each fluid ounce represents:	
Alcohol (by volume)	17%
Iron (as proteinate)	120 mg.
Liver Concentrate (20:1)	500 mg.
Cane sugar, glycerine flavoring—aa	q.s.

Tablets **HEMABOLOIDS** with Liver Concentrate

Each tablet represents:	
Iron (as proteinate)	35 mg
Liver Concentrate (20:1)	100 mg.

HEMABOLOIDS ARSENIATED

Each fluid ounce represents:	
Alcohol (by volume)	17%
Arsenous Acid	1/20 gr
Iron (as proteinate)	120 mg.
Cane sugar glycerine, flavoring—aa	q.s.

How mild can a cigarette be?

In a recent coast-to-coast test, hundreds of men and women smoked Camels—and only Camels—for 30 consecutive days These people smoked on the average of one to two packages of Camels a day during the entire test period Each week, throat specialists examined these Camel smokers A total of 2,470 careful examinations were made by these doctors After studying the results of the weekly examinations, these throat specialists reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION DUE TO SMOKING CAMELS!"

Money-Back Guarantee!

Test Camel mildness for yourself in your own 'T-Zone ' T for taste, T for throat. If, at any time, you are not convinced that Camels are the mildest cigarette you've ever smoked, return the package with the unused Camels and we will refund its full purchase price, plus postage *(Signed)* R. J Reynolds Tobacco Company, Winston Salem, North Carolina.

According to a Nationwide survey

MORE DOCTORS SMOKE CAMELS

than any other cigarette

Doctors smoke for pleasure too! And when three leading independent research organizations asked 113 doctors what cigarette they smoked, the brand named most was Camel!

Nutritional adjuvants and supplements

The extension of the usefulness of vitamins, beyond the specific deficiencies which they cure and prevent, is a therapeutic phenomenon of the past decade Those who specialize in nutritional disease have frequently emphasized to physicians the doctrine that every cell in the body needs every vitamin all of the time Today, fortunately, physicians are increasingly realizing the importance of the nutritional phase of medicine Lederle has been pre-eminent in the vitamin field for many years Its list of vitamin products includes combinations and single vitamins adequate for every clinical need

"This is LIFE..."

Protein Hydrolysate

BAXTER

Available with or without Dextrose

Protein is essential in the diet. It is life itself But people cannot always have it in the palatable form of red meat. For example a surgical patient faces the shock of tissue destruction, blood loss loss of body protein Before and after surgery, Protein Hydrolysate Baxter materially helps to meet the protein needs of the surgical patient. This new achievement of Baxter research is a beef product prepared from bovine plasma enzymatically digested Autoclaved, proven sterile and non pyrogenic, it is conspicuously free from reactions. Full information is available on request.

The severe, painful spasm associated with the hypertonic or hyperactive bowel of colitis suggests the need for the combined spasmolytic sedative action of—

PAVATRINE® with PHENOBARBITAL

(β-diethylaminoethyl fluorene 9 carboxylate hydrochloride)

Pavatrine, a potent, well tolerated, synthetic spasmolytic, is unique because of its combined *neurotropic* and *musculotropic* action on painful, smooth muscle spasm The inclusion of the mild central nervous system sedative, phenobarbital, affords effective symptomatic relief in such prevalent conditions as gastrointestinal hypertonicity, pylorospasm associated with peptic ulcer, dysmenorrhea and bladder spasm

the difference is noteworthy

Trimeton

(brand of prophenpyridamine)

TRIMETON* differs from most other antihistaminic agents in not being a derivative of ethanolamine or ethylenediamine This difference is noteworthy and is responsible for the gratifying clinical results obtained In one study of 227 patients with various allergic conditions[1]

83% obtained benefit from Trimeton

Side effects, common to all antihistamines, occur with TRIMETON, but only a few patients find that they cannot tolerate the drug[1]

Relief from allergic symptoms is usually obtained with one TRIMETON 25 mg tablet three times daily, in some patients half this dosage is sufficient The action of TRIMETON lasts from four to six hours[2]

PACKAGING: TRIMETON (1 phenyl 1 (2 pyridyl) 3-dimethylaminopropane) is available in 25 mg. tablets scored in bottles of 100 and 1000

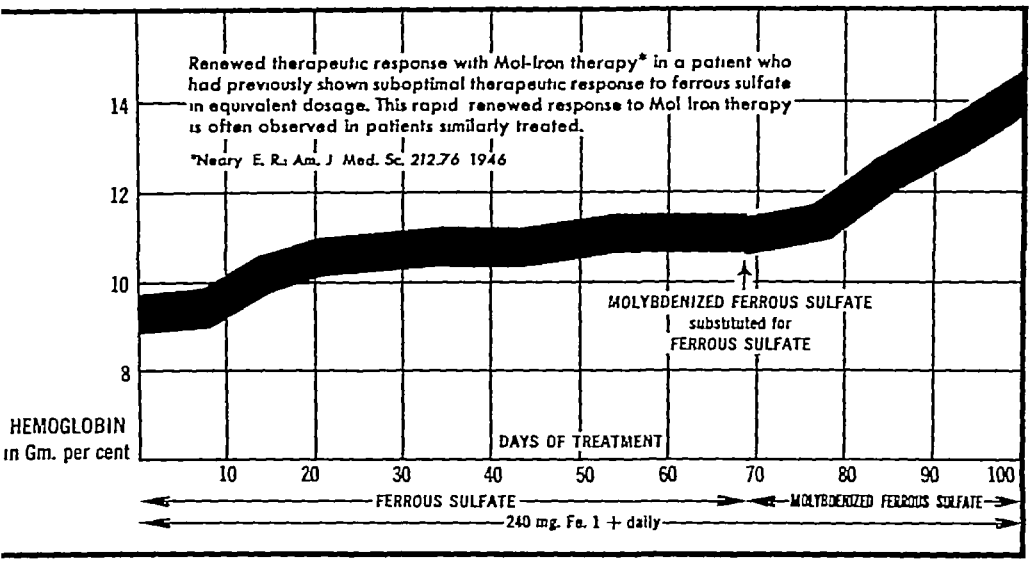
changing from PZI to GLOBIN INSULIN

When protamine zinc insulin treatment is complicated by post-prandial hyperglycemia, nocturnal insulin reaction, protamine sensitivity, or other difficulties, a change to Globin Insulin often results in the desired improvement The change is achieved in three steps

1 THE INITIAL CHANGE-OVER DOSAGE: The first day, 30 minutes or more before breakfast, give a single dose of Globin Insulin, equal to ½ the total previous daily dose of protamine zinc insulin or of protamine zinc insulin combined with regular insulin The next day, dose may be increased to ⅔ former total

2 ADJUSTMENT TO 24-HOUR CONTROL: Gradually adjust the Globin Insulin dosage to provide 24-hour control as evidenced by a fasting blood sugar level of less than 150 mgm or sugar-free urine in the fasting sample

3 ADJUSTMENT OF DIET: Simultaneously adjust carbohydrate distribution of diet to balance insulin activity, initially 2/10, 4/10 and 4/10 Any midafternoon hypoglycemia may usually be offset by 10 to 20 grams carbohydrate at 3 to 4 p m Base final carbohydrate adjustment on fractional urinalyses



Most mild and many moderately severe cases may be controlled by *one daily injection of 'Wellcome' Globin Insulin with Zinc* Vials of 10 cc , 40 and 80 units per cc Developed in The Wellcome Research Laboratories, Tuckahoe, New York, U S Pat 2,161,198 Literature on request

MEAT. . .

In the Rational Weight Reduction Program

One dictum is universally recognized in the planning of reducing diets the basic requirements of good nutrition remain unaltered, and adequate amounts of high-quality protein are the cardinal factor in the successful dietary management of overweight

Protein allowance in such a program is stated to be not less than 1 5 to 1 7 Gm per Kg of ideal body weight.[1] A further advantage of the diet high in protein and low in fat and carbohydrate is its greater simplicity, the tedious calculation of calories may be omitted without impairing the efficacy of the program [2]

It is therefore recommended that lean meat be given a dominant role in reducing diets.[1]

The protein content of meat is notably high Regardless of cut or kind, meat provides biologically complete protein able to satisfy the multiple amino acid needs of the body.

Lean meat, particularly, is of excellent digestibility. Its outstanding satiety value assures patient cooperation, a vital factor in the success of any weight reducing program

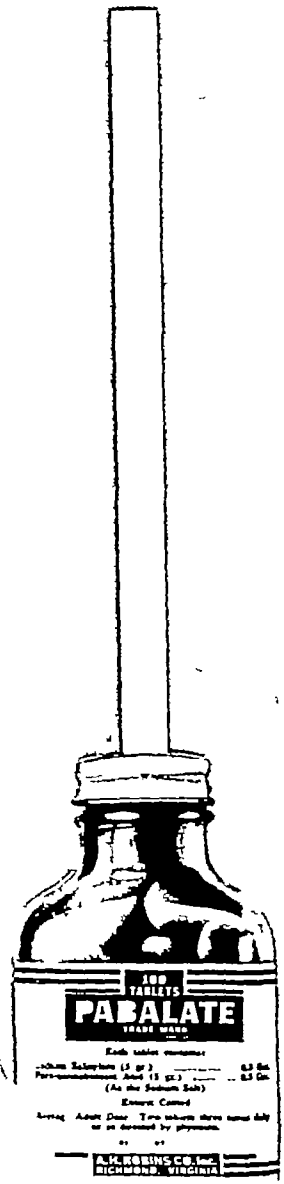
New... For Arthrit



minimal risk of salicylism!

By synergistic enhancement of the therapeutic efficacy of the antirheumatic agents in Pabalate, a higher and adequate salicylate titer is achieved from smaller dosage Thus, the usual danger of such distressing side actions as (*a*) visual and mental disturbance, (*b*) *dizziness*, (*c*) *sweating*, (*d*) *ringing in the* ears, and (*e*) hyperpnea, following ordinary salicylate therapy, is now greatly minimized Pabalate Tablets, furthermore, are coated to prevent gastric irritation and to assure maximal toleration and patient cooperation

ffections . . .

higher *salicylate blood levels on* lower *salicylate dosage . . .*

"Dramatic and complete clinical response"[2] in rheumatic affections have been observed from a combination of para-aminobenzoic acid with salicylates Recent studies have established para-aminobenzoic acid not only as an effective antirheumatic, causing "fall in temperature and relief of the joint pains,"[1] but also as acting synergistically with the salicylates[1,2,3]— increasing blood salicylate levels "two to five times"[1,2] by reducing the salicyl ion's urinary excretion [2,3] Now, in the new Pabalate, Robins' research makes this potent combination available for the management of the arthritides—*with minimal risk of salicylism!*

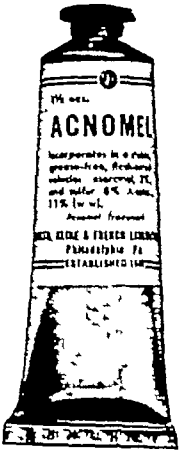
an effective

new preventive

for motion sickness

Mosidal is a drug in tablet form offered for the prevention and treatment of nausea caused by the motion of automobiles, airplanes and ships. Protection continues for 15 to 18 hours after treatment without undesirable side-effects

The drug is ethyl *beta*-methylallylthiobarbituric acid which acts as a depressant against the nerve centers concerned with vomiting Wartime studies revealed that this drug exerts a protective and therapeutic action against motion sickness, affording protection or improvement in 78 percent of the test cases *



One Mosidal tablet (0 15 Gm.) taken immediately after the morning and evening meals is the suggested dosage. In this dosage the drug has very little depressant effect. Treatment should not be continued for more than five consecutive days

Small, easy-to-swallow Mosidal tablets are now available at your pharmacy—on prescription only—in bottles of 25 and 100 Write for professional literature.
Abbott Laboratories North Chicago Ill.

How its special vehicle makes Acnomel a significant advance, clinical and cosmetic, in acne therapy

Acnomel's superior vehicle embodies an entirely new principle in topical acne therapy To this vehicle—a stable, grease free, flesh tinted hydrosol—Acnomel owes the following important advantages

- It is easy to apply smoothly and evenly
- Upon application, it dries in a few seconds
- Its active ingredients are maintained in intimate and prolonged contact with the affected areas
- It removes excess oil from the skin
- It is readily washed off with water

Active ingredients resorcinol, 2% sulfur, 8%
Available, on prescription only, in specially lined 1½ oz tubes

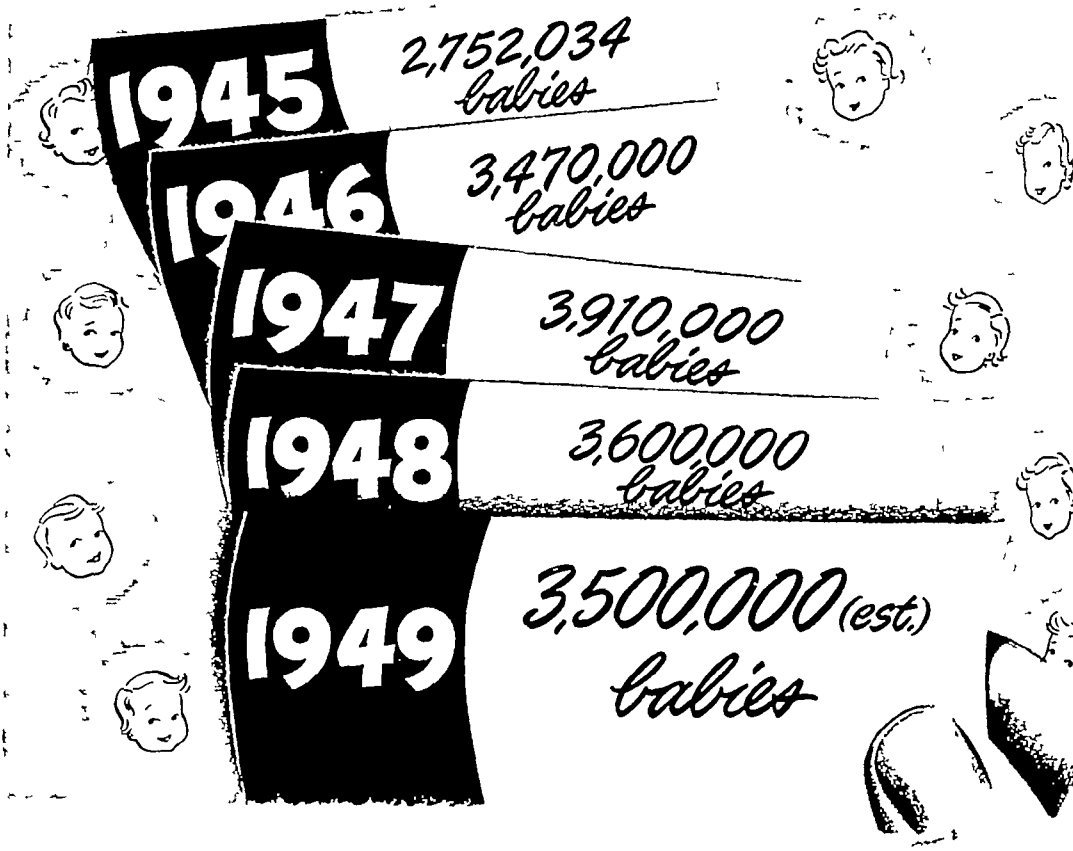
Smith, Kline & French Laboratories, Philadelphia

Your Job— And Ours:

To Build a Sound Foundation

Your careful supervision assures babies of that solid foundation of bone and tooth development so essential to healthy growth We're glad to share a little of that responsibility by providing Nestlé's Evaporated Milk— recognized by the profession as a reliable foundation builder

Nestlé's Has the "Know-How" to Produce a Good Product



- For 75 years Nestle's milk products have been best known, most used for babies round the world
- Nestle's was the *first* evaporated milk fortified with 400 U S P units of genuine Vitamin D_3 per pint.
- Nestle's accepts milk only from carefully inspected herds As further assurance of quality rigid controls check Nestle's Milk every step of the way We even take the plant apart every day and wash it!

NESTLÉ'S EVAPORATED MILK

No wonder so many doctors recommend NESTLÉ'S Milk by name

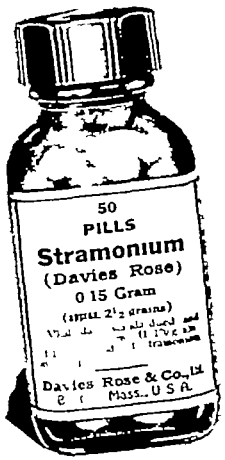
NESTLÉ'S MILK PRODUCTS, INC., New York, U. S. A.

Borden's prescription specialties are flexibly adaptable to cope effectively with the sharply increased number of your infant feeding problems

BIOLAC—a complete infant formula (only vitamin C supplementation needed) for infants deprived of mother's milk

DRYCO—a powdered, high-protein, low-fat, moderate carbohydrate milk food ideally suited for all formulas

BETA LACTOSE—an exceptionally palatable highly soluble milk sugar for formula modification



MULL SOY—a hypo-allergenic emulsified soy food for infants and adults allergic to milk proteins The 1 1 standard dilution approximates cow's milk in fat, protein, carbohydrate and mineral content.

KLIM—a spray dried whole milk with soft curd properties essential in infant feeding and special diets Particularly valuable when availability or safety of fresh milk is uncertain

Borden prescription products are available at all drug stores. Complete professional information may be obtained on request.

An interesting new development in inunction therapy

Because of the constant demand for an external preparation that can be safely used as a "home remedy," we have developed Antiphlogistine Rub A-535

Rub A-535 is intended for the symptomatic relief of those conditions for which external analgesics and counter-irritants are commonly used Rub A-535 contains a combination of analgesics with a high percentage of methyl-salicylate in a new type of greaseless, stainless, vanishing base, which permits ease of application and almost instant utilization of the medications

Because home remedies are used generally, we believe the manufacturer has a dual responsibility He must offer only such products which may safely be used in the average household and must inform the medical profession of the products' ingredients and action.

The formula of Rub A-535 is

Methyl-Salicylate	12%
Oil of Eucalyptus	½%
Menthol	1%
Camphor	1%
Base (specially prepared)	85½%

Antiphlogistine Rub A-535 has been thoroughly tested both clinically and in over 6,000 homes If you would like a tube of Rub A-535, just drop us a line

A MEMBER OF THE VITAMIN B COMPLEX OF GREAT THERAPEUTIC PROMISE

THE availability of inositol, a member of the vitamin B complex, follows many years of intensive laboratory and clinical investigation In the experimental animal inositol has been shown to be intimately concerned with fat and lipoid metabolism It exerts a distinct lipotropic action on the liver and is capable of counteracting the influence of metabolic aberrations or of a disturbed dietary known to induce lipoid degeneration Inositol also has been shown to reduce the severity of or prevent the development of atherosclerosis in animals fed a high cholesterol diet

While the clinical applicability of inositol is not clearly defined at this writing, most of the investigators who have worked with this substance are unanimous in the thought that it holds great promise in the treatment of degenerative arterial processes, many hepatic disorders, and certain metabolic diseases

Inositol-C S C is available in 0 5 Gm capsules in bottles of 100 A complete review of the literature on inositol and dosage recommendations arising therefrom are available to physicians on request

Council Accepts Propion® Gel

Propionate compound jelly

A new treatment for mycotic vulvovaginitis (moniliasis), Propion Gel was developed to free physicians and patients from the disadvantages of the classical gentian violet method It contains propionates and propionic acid two highly effective anti fungous agents

Clinical reports show that Propion Gel usually produces symptomatic relief in three days or less negative cultures after three weeks in many obstetric, in nearly all gynecologic, cases Also that Propion Gel is innocuous, convenient, nonstaining

As a result of this evidence, Propion Gel now stands accepted by the Council on Pharmacy and Chemistry of the American Medical Association for inclusion in *New and Nonofficial Remedies*

Literature on request Propion Gel comes in 95 gram tubes (7 day supply)—with or without applicator Wyeth, Philadelphia, Pa

Lilly

ELI LILLY AND COMPANY INDIANAPOLIS 6 INDIANA U S

TRESANOIDS combine tyrothricin and benzocaine in a soothing, astringent formula with an entirely new, heat stable (m p 48-50°C), water washable base

They Don't Melt They Dissolve!

TRESANOIDS remain firm at room temperature and will not melt even at body heat Yet TRESANOIDS act promptly because they are water soluble and disintegrate quickly in the moisture of the rectum, relieving pain and combating gram positive organisms

Antibiotic Analgesic

Indicated for antibiotic analgesic therapy of hemorrhoids, anal fissure, cryptitis, and proctitis, each water soluble TRESANOIDS suppository releases *Tyrothricin*, 1 mg , *Benzocaine*, 15 mg , *PROPADRINE® HCl*, 20 mg , *Bismuth subgallate*, 150 mg , *Zinc oxide*, 150 mg Supplied in boxes of 12

For a sample quantity, mail this page and your prescription blank to Professional Service Dept , Sharp & Dohme, Phila 1, Pa.

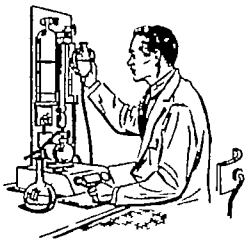
The Annual Meeting Reminder

Once more, as the blusterings winds of March whistle about the eaves, may we remind our readers that the Annual Meeting is approaching It will be held this year at the Hotel Statler in Buffalo, May 2 to 6, inclusive If you have not already made plans to attend, please do so now Make your room reservations now as space this year is at a premium Write now

This year the specter of national health insurance threatens the public interest Delegates to the Annual Meeting must know how you stand on this vital issue if they are to represent you on questions pertaining to it The A M A through its new public relations representatives is doing a herculean task of educating the public on the pros and cons of socialized medicine Are you discussing with the delegates from your county society how you feel about it? Are you informing your patients? Are you doing a good public relations job for the medical profession right in your office and in the hospitals? If you are, that is part of the task A second part is to keep yourself informed

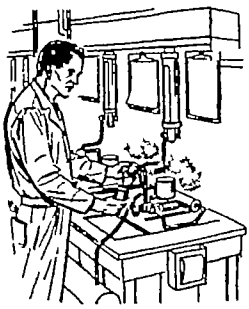


At the Annual Meeting you will hear the latest scientific advances in medicine described in the various section meetings, you will see the newest and most up-to-date instruments displayed, the most advanced pharmaceuticals These are the things that the ingenuity of private enterprise has created to help you make the medical care you give to your patients the finest in the world If only to familiarize yourselves with the newest modalities available to you, attend the meeting without fail. Watch for the April 1 issue of the JOURNAL, the Annual Meeting number

Meanwhile, make your reservations now

Veterans' Home Town Medical Care

In September, 1948, the question of a renewal of the contract between the Veterans' Medical Service Plan of New York, Inc , and the Veterans Administration, whereby outpatient home town medical care for service-connected veterans' disabilities is rendered,



HOW MANY TALENTS SERVE THE DIABETIC?

First, of course, are those of the attending physician It is he who must make the diagnosis and prescribe diet, exercise, and Insulin The physician's success, however, is inextricably bound up in the ability and integrity of the manufacturer who makes and tests the Insulin he prescribes

Pharmaceutical manufacturing, like the practice of medicine, draws upon many sciences and skills During the twenty-six years of the Banting Era, for example, Eli Lilly and Company has painstakingly built up a competent staff of experienced technicians in the specialized field of Insulin manufacture and control

Every lot of Iletin (Insulin, Lilly), from the grinding of the frozen pancreas glands to the final physiological assay, is under a specialist's supervision These men welcome the responsibility of serving you and your patient with potent, stable, and uniform preparations of Iletin (Insulin, Lilly)

Lilly

LILLY SPECIALISTS SERVE THE MEDICAL PROFESS

selves, want this kind of medical care and will assist the Medical Society of the State of New York in maintaining it on an honest, properly safeguarded basis, can the physicians of the State hope to be in a position to provide it Such service cannot be rendered cheaply, it cannot be given "free," *somebody has to pay for it in some sort of currency* The physicians can only make it medically possible, the Coordinators can only see to it on behalf of the Medical Society of the State that it conforms to the rules, the principles of ethics, and that violations are properly and sufficiently investigated with the help and assistance of the Inspection and Investigation Department of the VA The single principle involved is free choice of hour, place, and physician who will care for the disabled veteran Do the veterans themselves want it? The Medical Society of the State of New York can only *advise* the veterans and their organizations that *in our opinion* maintenance of the Veterans' Home Town Medical Care Plan is the surest way of assuring the highest quality of medical service with a minimum of hardship What say the veterans? What say their elected officials in the State of New York?

Resolution to Oppose Socialized Medicine Passed by the American Legion

WHEREAS, The American Legion has consistently opposed all efforts to socialize medicine in the United States as evidenced by the resolution adopted in 1945 and reiterated in 1946, and

WHEREAS, there is still persistent and constant effort being made to enact socialized medicine legislation for the alleged benefit of all the people of the United States, and

WHEREAS, compulsory health insurance would result in a general loss of our high standards of health care which now exist and would deprive us of a large measure of our personal liberty and would also increase the burden of bureaucracy, and

WHEREAS, Government control of medical care would add an enormous tax burden to the American people, including hundreds of thousands of our disabled veterans of both wars, and widows and orphans of our deceased veterans, and

WHEREAS, The American Legion takes pride in our program of improving the standard of medical care within the Veterans Administration and other contract institutions, which has now done much to elevate the standard of care in all hospitals, and

WHEREAS, it is still our conviction that any compulsory health insurance plan—political medicine—destroys the essential personal relationship between patient and the doctor of his choice and increases Government supervision and control of our private lives and is in full substance and effect—the planned economy of a collectivist nature—and,

WHEREAS, the Communists have proclaimed "socialized medicine is the keystone to the arch of the socialistic state," and

WHEREAS, any plan of compulsory health insurance would have the tendency to lower the standard medical care that is now guaranteed our veterans and would also deprive the citizen of the right to select the quality of medical care that he can afford, and this, we believe, is contrary to the fundamental rights of the individual, and

NOW, THEREFORE, BE IT RESOLVED by The American Legion in Convention assembled in Miami, Florida, this 18th, 19th, 20th, and 21st of October, 1948, that we are still unalterably opposed to all efforts and movements to enforce socialized medicine upon the American people

(Sponsored and recommended by the Department of Illinois)

came up for consideration It had been previously renewed on June 30, 1948, for a period of three months For some time the VA had wanted to discontinue the supervision by the State Medical Society of the medical aspects of the plan through its Coordinators who are paid by VA funds but who are responsible to the Society

For some time also the Medical Society of the State of New York had questioned whether the veterans' own organizations in the State were fully aware of the extent to which the veterans' medical care available to the veteran under the Veterans' Home Town Medical Care Plan was being curtailed in favor of medical care rendered in VA outpatient clinics The executive secretary of the Society accordingly wrote a letter to the commanders of the veterans' organizations of New York State on September 13, with regard to the matter, calling the commanders' attention to the effort of the VA to curtail home town medical care and the free choice of physician, which was a principal point of contention in the contract renewal negotiations then being considered by representatives of the Society and the VA The thought was that the veterans' organizations might be of assistance to the Medical Society of the State of New York in retaining for the veterans of the State continuance of the Veterans' Home Town Medical Care Plan for service-connected cases, and the avoidance of a return of the type of indifferent clinic care which, following World War I, had occasioned considerable hardship, loss of time, inconvenience, and needless suffering to many veterans of the State

As evidence of the way the leaders of the veterans' organizations feel about the medical services available to the veteran under the Veterans' Home Town Medical Care Plan, we quote from one of the replies received

> It is felt that the chief reason for the establishment of the clinics is to save funds and thus grant the veteran the best in medical care at the least expense This is most laudable, but in saving public funds it may cause the individual veteran a day's pay and some personal expense in travel funds
>
> I feel in looking at the entire picture from both sides that a return to the former system of treatment by private physician will serve the best interests of the veteran in many cases That, while I do approve of the clinics as now established, the element of choice should be left to the veteran, especially those who live in the more remote areas and for those who cannot attend the clinic without loss of wages due to the hours of operation of the clinic conflicting with the hours of employment

From another commander who apparently has been advised that there have been gross abuses, by some doctors, of the privileges granted under the plan, we quote the following

> "I am certain that the Medical Society of the State of New York has done and will continue to do everything in its power to eliminate such undesirable practices (abuses) on the part of members in its profession

So that every veteran and every tax-paying citizen may understand that the Medical Society of the State of New York does not countenance any abuses of the privileges granted the doctor whatsoever, we submit that the Medical Society of the State of New York has been from the beginning insistent upon retention of its Coordinators for just this purpose, and this even against the increasing pressure of the VA to abridge this safeguard by clinic treatment of service-connected disabilities, thus eliminating from the plan the Coordinators and the participation of private home town physicians

The observation quoted from the second letter has so moved the directors and participating members of the Veterans' Medical Care Plan that we, both veteran and non-veteran physician alike, sincerely trust that the smokescreen of barely tenable allegations of abuse, not by many but by a few physicians participating in a vast plan to render high-quality medical care to veterans without hardship, loss of time or inconvenience, will not be permitted to deprive the service-connected disabled veteran, if he desires it, of the best service the physicians of the State can render to him or her

We feel that it is incumbent upon the leadership of the veterans' own organizations not only to understand the principles involved, but also to interpret them accurately to their membership Only if the individuals, the tax-paying veterans them-

suppuration and fluid formation in peritonitis, empyema, intestinal obstruction, and cirrhosis of the liver may deplete the body protein stores While there is definite nitrogen loss associated with all operations, fractures, and injuries, this loss is not likely to be of a magnitude which will threaten protein deficiency in a healthy individual, unless intake of protein is delayed for some time On the other hand, further nitrogen loss can be serious in a patient already depleted of protein stores

Altered protein synthesis, especially in the albumin fraction, may account for plasma albumin deficiency in hepatic disease In depleted states, protein stores in the liver are dependent on an extraneous supply of protein before restitution of plasma albumin can be made, especially if anemia is present Robscheit-Robbins and associates have shown that in dogs, depleted of both plasma proteins and hemoglobin, the latter is always produced more abundantly than plasma proteins and often is produced at their expense [10] In the patient with acute yellow atrophy plasma transfusions can be life saving if given promptly and continued until the liver regenerates.

Effects of Protein Deficiency

While it is true that the level of the albumin fraction of plasma proteins most frequently falls early with protein depletion, the actual amount of circulating plasma albumin cannot be predicted from the serum albumin level of the blood Many observers have pointed out that blood volume decreases with protein depletion, thereby reducing the amount of circulating albumin [11 12] In fact, there is considerable evidence that plasma proteins have a regulatory effect upon blood volume.[13] Sachar and associates feel that hypoalbuminemia can be used as a quantitative measure of tissue protein depletion [14] They postulate that, for every gram of change in total serum albumin, there has been a concomitant change in the same direction of 30 Gm of tissue protein Restoration of plasma albumin does not take place on refeeding until protein is restored to the organ responsible for the formation of plasma albumin, namely, the liver

The osmotic pressure of the plasma proteins in drawing tissue fluid into the capillaries is a potent force in maintaining a constant plasma volume The albumin fraction has the major osmotic effect A level below 2 5 Gm per cent plasma albumin usually results in edema [15] A large salt and fluid intake, however, may alter the level of plasma albumin at which edema appears [16] Either depletion of plasma proteins or excessive sodium intake in a protein-depleted patient may result in the postoperative complication of intestinal edema [17] Abdominal distention is relieved promptly following plasma transfusions, lending support to the view that hypoproteinemia is a cause rather than an effect of the condition [18]

There have been many reports associating hypoproteinemia with high incidence of wound disruption They stress the importance of adequate protein stores for wound healing [19–21] Vitamin C deficiency may be responsible in part for poor wound healing However, low ascorbic acid values are frequently found in hypoproteinemia

The long series of reports of Cannon and coworkers emphasize that good protein reserves are required for the formation of globulin and antibodies [22–24] In protein-depleted animals, antibodies are deficient Madden and Whipple and Sako have demonstrated that hypoproteinemic animals are less resistant to infection than ones with normal protein levels [25 26]

Hypoproteinemia exhausts important protein stores One of these is the protein in the liver When this occurs, the liver is more subject to injury from anesthetics Extensive experimental work with animals has demonstrated that protein best protects the liver from anesthetics and other toxic agents [27 28] The effect of starvation on the liver is profound. After short periods of fasting, liver weight is reduced considerably at the expense of its protein content [29]

Many conditions of clinical importance have been found to originate from protein privation Restoration to an adequate nutritional state before operation and correction of acute hypoproteinemia postoperatively, if it occurs, decreases surgical mortality Likewise, by recognition and correction of the chronic hypoproteinemic states of

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Parenteral Nutrition, II — Protein Privation

Malnourished patients usually can be recognized by their appearance Sometimes, however, appearances are deceptive Blood level tests may be inconclusive, too Nevertheless, the true status of a patient must be determined so that proper preoperative treatment is given the surgical patient and replacement therapy is begun for the medical patient before a critical nutritional phase is reached In both medical and surgical patients, loss of body weight and the rate of loss of weight are important guides Knowledge of the patient's food intake, which can be gained only by a diet inventory, enables the doctor to judge whether the weight loss has occurred at the expense of protein or fat For a patient whose protein stores have been severely depleted, surgical risk is great Studley reports that more than a 20 per cent loss of weight increases surgical mortality from 3 per cent to 33 per cent in cases operated for complications of duodenal ulcer [1] Varco has stressed the importance of prolonging preoperative treatment in proportion to weight loss if surgical mortality is to be reduced [2]

Because protein privation is often insidious, and because its recognition is important, a short review of the frequent causes of protein deficiency is given, together with its common effects on body function

Frequent Causes of Deficiency in Protein

Starvation is probably the most common cause of protein deficiency Many lesions of the mouth and esophagus interfere with the taking of food Care must be exercised when a liquid diet is substituted for a mixed one in cases of partial obstruction, as the wrong ingredients will precipitate a protein deficiency Anorexia follows protein starvation and may increase protein privation, even though the earlier obstructive difficulties may no longer interfere Loss of appetite usually is reversed on resumption of positive nitrogen balance, either through proper oral feeding or after parenteral amino acids are administered [3]

Faulty absorption of adequate protein intake may lead to protein privation In many medical and surgical conditions, altered absorption is the rule Diarrhea, ulcerative colitis, and fistulas involving the small intestine alone or in combination with the stomach and colon can deplete protein stores if the advantages of parenteral feeding are not utilized Histologic changes have been observed in the intestinal villi of animals during starvation Atrophied villi commonly associated with the latter state usually regenerate after refeeding If regeneration does not take place, the animal dies [4 5] It is not clear whether the same histologic changes occur in man Histologic and enzymatic alterations may be responsible for the phenomenon that some patients cannot respond to protein feeding, either by mouth or parenterally, when malnutrition has reached an advanced stage Reports of mass starvation during the last war do not consistently support the opinion of Magee that, in the terminal stages of starvation, a copious and persistent diarrhea with dehydration occurs as the result of chemical and histologic changes in the bowel [6–9]

Excessive protein loss often accounts for protein privation In tubular lesions of the kidney, large amounts of protein leave the circulation Likewise, internal hemorrhage, plasma loss from open wounds and burns,

THE MECHANISM OF THE STRUCTURAL CHANGES IN SCOLIOSIS

Preliminary Report

ALVIN M ARKIN, M D , New York City

(From the Orthopedic Services of Bellevue and Mount Sinai Hospitals)

STRUCTURAL scoliosis may be defined as that form of lateral curvature of the spine which is accompanied by the development of wedging and deformation of the vertebrae It is to be differentiated from functional scoliosis which is not accompanied by vertebral wedging or deformation This paper will attempt to describe the mechanism of development of the structural changes in scoliosis

The relationship between pressure and epiphyseal growth has been mentioned by various authors Haas showed that compression of an epiphyseal plate by a wire will arrest growth [1] The wire itself without compression has no effect, and growth will be resumed when the pressure is removed

The mechanics of a scoliotic curve can now be considered, bearing these factors in mind Figure 1 reveals that there must be compression of the concave sides of the vertebral bodies and distraction at the convex sides This is also indicated by the narrowing of the intervertebral disk on the concave side and its expansion on the convex side in the roentgenogram of a scoliotic spine

It is impossible to realize the tremendous order of magnitude which this pressure may assume unless a diagram of the forces acting upon the vertebral body is constructed (Fig 2) Let x represent the distance perpendicularly from the line of center of gravity to the near edge of the disk, and let y represent the distance from the pivot point or fulcrum (corner of the body) to the ligament on the convex side of the curve Hence, the weight concentrated on this small section of the body will equal superincumbent weight plus superincumbent weight times x/y

Here, then, is tremendous compression, concentrated on a very small section of the growing epiphyseal plate (the superior and inferior surfaces of the body which grow by enchondral ossification), sufficient to arrest the growth in height on the concave side and lead to the typical wedged vertebra characteristic of the apex of a scoliotic curve Wedging can be explained only by unilateral epiphyseal arrest since

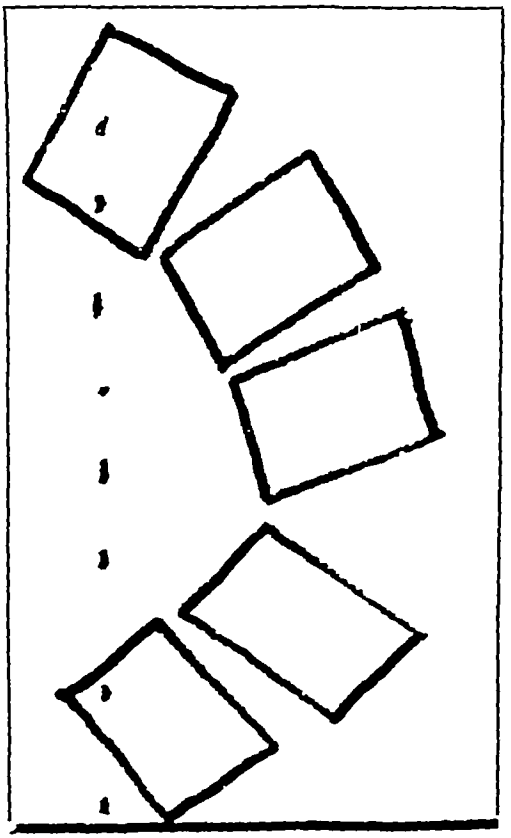

FIG 1 Action of superincumbent weight on a column of blocks.

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Orthopedic Surgery May 21 1948.

medical patients, reversal of deteriorating trends is frequently achieved

NOTICE TO MEMBERS

The Council of the Medical Society of the State of New York formally approved the collection of the A M.A assessment at its meeting held February 10, 1949

THE A M A ASSESSMENT

The following letter has been forwarded to all members of the Medical Society of the State of New York, it should meet with an early response

My dear Doctor

The House of Delegates of the American Medical Association at its recent meeting in St Louis unanimously voted to assess each of its members $25 to carry on a nation-wide program of education on the progress of American medicine

The House of Delegates, who are your own representatives, are calling on you to join with one another, and with them, in a concerted effort to protect our patients and to preserve the ideals, the independence, and the integrity of the medical profession

American medicine is at the crossroads, and the health of the people is at stake Within a short time Congress will be called upon to make a grave decision This issue, in the last analysis, will be determined by the people—our patients

The medical profession, as represented by the A M.A , needs your $25 More than that, however, it needs you, your efforts, your determination and loyalty

May I, on behalf of the Medical Society of the State of New York, urge you to make your remittance now Make your check payable to the American Medical Association and mail it to the office of the State Society, 292 Madison Avenue, New York 17, New York It will be forwarded to Chicago as soon as it is received

With my sincere best wishes, I am

Very sincerely yours,

Leo F Simpson

President

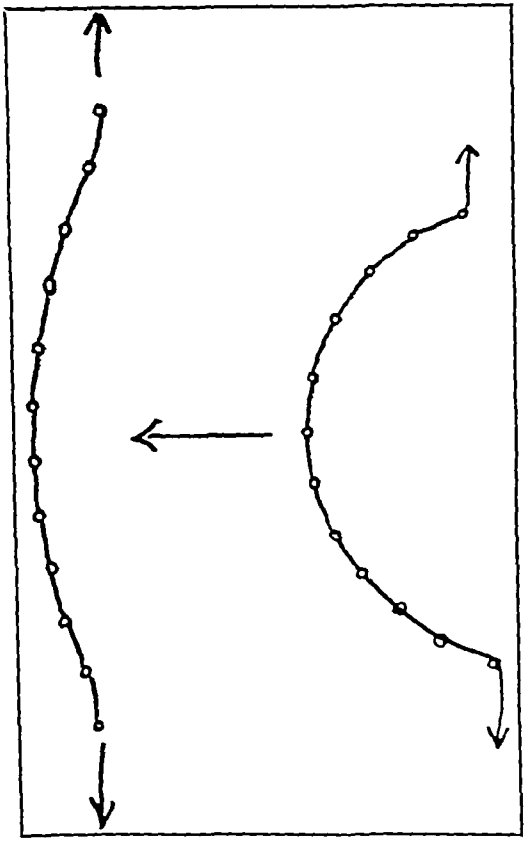

FIG 5 Extension of a curved line.

oblique or sidewise deflection of growth by the pressure forces at the epiphyseal region It is suggested that the slow deformation in slipping of the femoral capital epiphysis is produced similarly

If a diagrammatic representation of a wedged vertebra, as seen from above, is examined, it is noted that the body is squeezed over to the convex side (Fig 4) It is known that no muscles act upon the body to distort it in this fashion, and this passive deformation in the direction of increasing rotation about the facets, it is realized, is the result of the wedge action described above

However, the spinous process is also deviated—to the concave side This cannot be the result of wedging since it is not wedged and not in contact with any other bone The deformation must be the result of forces in soft tissue, since only soft tissues contact the spinous process Moreover, this deformation is in the direction of increasing rotation, and it seems, therefore, that there must be some muscular or ligamentous component of rotation.

If reference is made to Fig 5, the line of dots represents the tips of the spinous processes in a scoliotic spine The line connecting these dots represents the interspinous and supraspinous ligaments Obviously, when these ligaments are put under tension (in a kyphoscoliosis), they tend to straighten out the curve as shown In addition, the long spinal muscles on the convex side tend to push, and the muscles on the concave side tend to pull the spinous processes into a straight line, the shortest distance between two points In a spine which is perfectly straight, there would obviously be no tendency to push or pull the spinous processes to either side

Development of Compensatory Curves

Let us consider a single major curve such as that indicated in Fig 6 The ends of the curvature are bent back or recurved, due to the attempt of the patient to level off his pelvis and head The vertebral bodies in this region are unwedged, hence these compensatory curves are functional, not structural

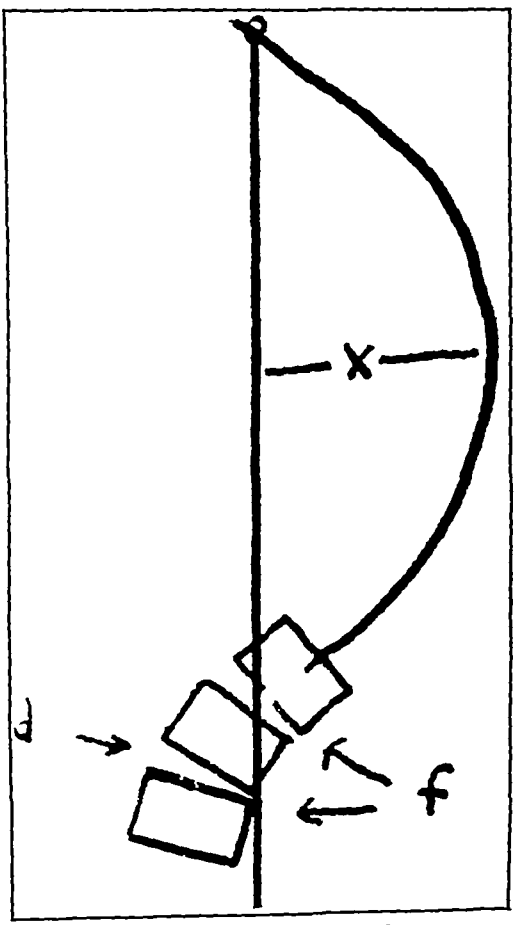

FIG 6 Recurvature of the ends of a curve

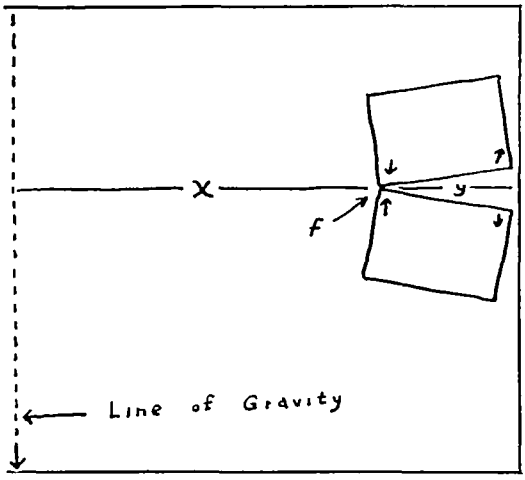

FIG 2 Forces acting on an apical vertebra in scoliosis

the same tremendous compression applied after growth is completed does not cause wedging

Examination of a typical vertebra from above will show that the normal spine may be considered to be supported at four points denoted by A, B, C, and D (Fig 3) Lateral bending in the normal spine takes place through the axis AD If support A is depressed by the mechanism described above, then lateral bending will take place through the axis BD Hence the concavity of the curve is directed anteriorly as well as laterally producing the kyphoscoliosis seen clinically

Rotation

A wedged vertebral body under compression acts like a wedge and is squeezed out laterally when pressure is applied, leading to the convex side rotation seen in scoliosis Some of the rotation occurs by the actual rotation of a body across the one adjacent (between the individual bodies), although this is limited by the surrounding ligaments and, especially, by the limited excursion of the posterior joints

Much of rotation occurs by plastic torsional deformation within the individual vertebra against the resistance of the posterior articulations The bodies' internal structures follow

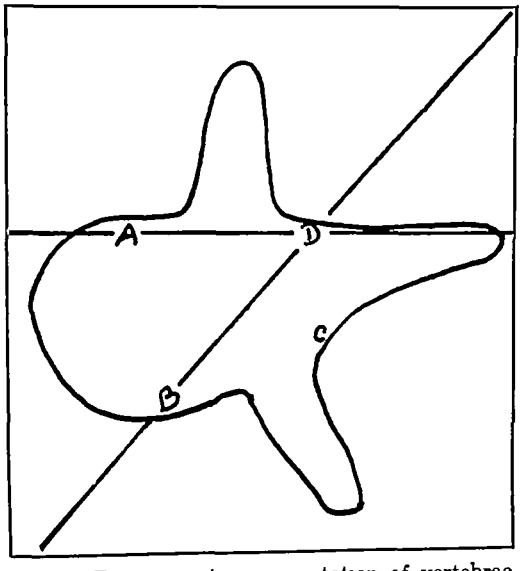

FIG 3 Diagrammatic representation of vertebrae seen from above

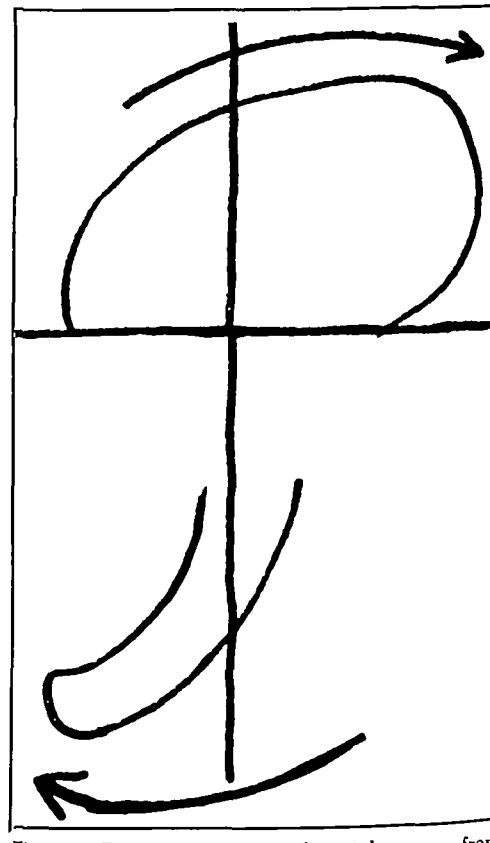

FIG 4 Rotation in an apical vertebra seen from above

accurately the lines of force occurring in a structure such as that shown in a scoliotic spine with weight-bearing The bodies at the apex of the curve are subjected to internal plastic deformation due to the "wedge" action The bodies at the upper and lower end of the curve show deformation in response to the lines of force which are oblique to their vertical axis leading to the formation of the "oblique" or "quadrilateral" vertebra found in this location. This plastic deformation ceases when epiphyseal growth ceases. Thus one may postulate that it is produced by an

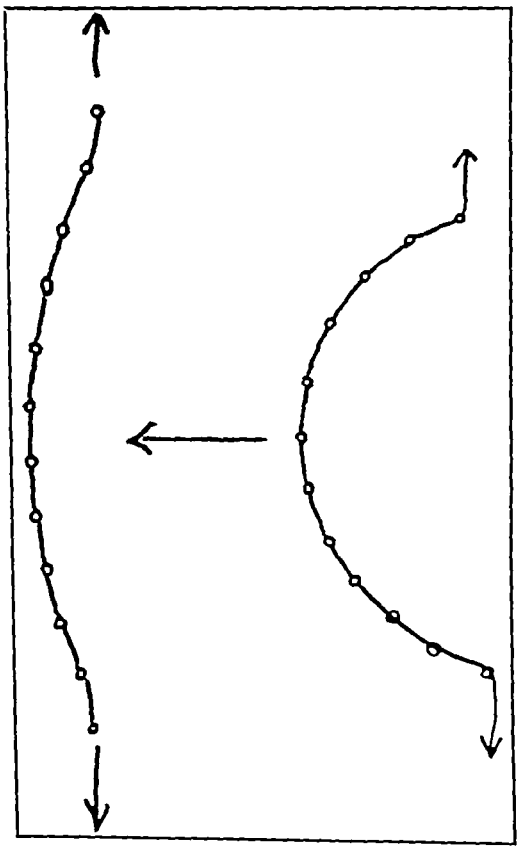

FIG 5 Extension of a curved line

oblique or sidewise deflection of growth by the pressure forces at the epiphyseal region It is suggested that the slow deformation in slipping of the femoral capital epiphysis is produced similarly

If a diagrammatic representation of a wedged vertebra, as seen from above, is examined, it is noted that the body is squeezed over to the convex side (Fig 4) It is known that no muscles act upon the body to distort it in this fashion, and this passive deformation in the direction of increasing rotation about the facets, it is realized, is the result of the wedge action described above

However, the spinous process is also deviated—to the concave side This cannot be the result of wedging since it is not wedged and not in contact with any other bone The deformation must be the result of forces in soft tissue, since only soft tissues contact the spinous process Moreover, this deformation is in the direction of increasing rotation, and it seems, therefore, that there must be some muscular or ligamentous component of rotation.

If reference is made to Fig 5, the line of dots represents the tips of the spinous processes in a scoliotic spine The line connecting these dots represents the interspinous and supraspinous ligaments Obviously, when these ligaments are put under tension (in a kyphoscoliosis), they tend to straighten out the curve as shown In addition, the long spinal muscles on the convex side tend to push, and the muscles on the concave side tend to pull the spinous processes into a straight line, the shortest distance between two points In a spine which is perfectly straight, there would obviously be no tendency to push or pull the spinous processes to either side

Development of Compensatory Curves

Let us consider a single major curve such as that indicated in Fig 6 The ends of the curvature are bent back or recurved, due to the attempt of the patient to level off his pelvis and head The vertebral bodies in this region are unwedged, hence these compensatory curves are functional, not structural

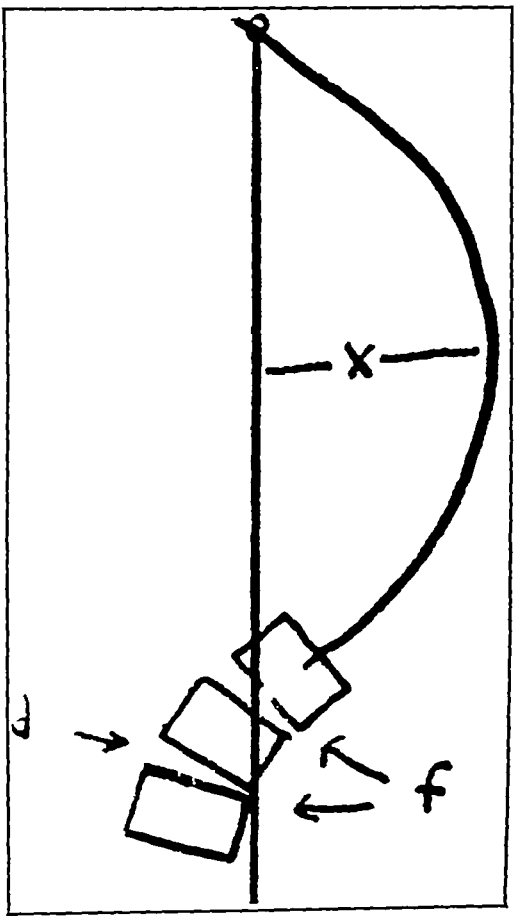

FIG 6 Recurvature of the ends of a curve

It will be noted in a radiograph of a scoliotic spine that, as the spine begins to recurve, the disks begin to be compressed on the opposite side of the bodies and on the concave side of the new curve (*d* and *f* in Fig 6) Pressure is thus falling on the corners of the bodies at point *f*, distraction is present at *d* This leads to inhibition of growth at *f* with wedging of the vertebra and conversion of the "functional" compensatory curve into a "structural" curve (Fig 7)

It must be understood the superincumbent curve need not be structural (wedged) in order to initiate the development of a functional counter curve Many purely functional curves have functional counter curves which have developed concurrently with them They have never deviated sufficiently from the weight-bearing line to cause wedging, and these well-compensated curves are usually static and do not progress to a structural scoliosis

Steindler has noted that, when structural scoliosis is arrested spontaneously, it is by the natural development of compensatory curves [2] His compensation treatment is designed to aid the development of this process, which, of course, is the principal means of correction in all methods of treatment, since the wedged apical vertebrae cannot be corrected He states "that a spine, well compensated by the development of a triple scoliosis, well-aligned, maintaining its balance under favorable conditions, is a matter of almost daily experience "[2]

An examination of Fig 7 will demonstrate why s is successful A factor determining the ount of weight acting upon the corner of the vertebral body, as shown earlier, is the *x* distance Compensation diminishes this distance and therefore diminishes the compression of the epiphysis It is to be remembered that Haas showed that growth resumed when compression was removed [1] Hence, with both sides of the epiphysis growing the deformity does not progress

Risser uses this principle in his method of treatment of scoliosis He has noted that by forcibly recurving the ends of the scoliotic curve he can produce wedging of the vertebrae (at point *f* in Fig 7), realizing that this is due to inhibition of growth by pressure

Figure 8 reveals the anteroposterior curves of the normal spine It will be noted that in the cervical and lumbar regions the normal lordosis relieves the anterior parts of these regions of the spine (the vertebral bodies) from part of the superincumbent weight, throwing it more upon the posterior articular facets This explains why the region from approximately the second thoracic to the second lumbar vertebra is the danger zone for the development of scoliosis The cervical vertebrae are practically never wedged The lumbar vertebrae are only partially protected, due to the greater superincumbent weight they carry (and due also to the forward displacement of the line of gravity in low dorsal kyphoscoliosis), but, at any rate, are sufficiently protected so that they rarely become wedged despite the frequency of functional curves due to inequality of leg length

Hence, when the *x* distance is increased by habitual postural kyphosis, excessive weight is thrown upon the dorsal vertebral bodies It is suggested that the epiphyseal rings, which appear at about the fourteenth year of life, are compressed by this mechanism, leading to "vertebral epiphysitis" or adolescent kyphosis

Comment

It has been shown how a functional, non wedged curve can progress into a fixed structural scoliosis The etiology of the preceding functional curve is not within the scope of this paper However, it may be assumed that the initiating cause of the functional curve may, in some cases at least, continue to contribute to the structural scoliosis which follows

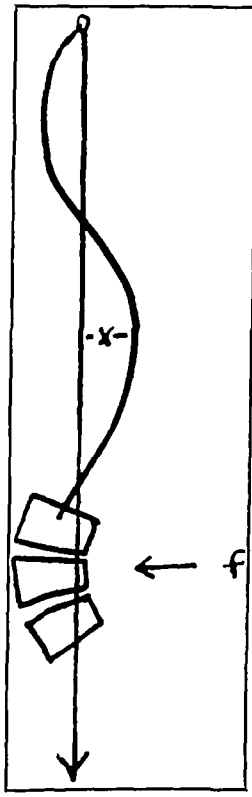

Fig 7 Formation of structural compensatory curve

Whatever the cause of the functional curve, as soon as it has produced a deviation exceeding a certain critical value, the *factors described* in this paper come into play, and the spine has embarked on the downward path of epiphyseal compression and structural scoliosis *

Some comment may be made about methods of treatment Obviously, the best treatment is prevention by correcting postural deviations, whether in the anteroposterior and/or the lateral plane, before they progress to structural changes In a severe curve, plaster jackets and braces cannot completely relieve the epiphysis of the pressure induced by the superincumbent weight, tremendously multiplied as it is by the mechanical arrangement which obtains Recumbency, of course,

removes the superincumbent weight completely A combination of the two methods above (jackets or other means of lateral deviation plus recumbency) would seem to offer the better prospect of successful conservative treatment

Summary

1 The vertebral deformation of structural scoliosis can be explained as an asymmetric disturbance of epiphyseal growth by pressure

2 Adolescent kyphosis ("vertebral epiphysitis") may be explained by a similar mechanism

Discussion

Mather Cleveland, M.D , *New York City* —Dr Arkin should be commended for an interesting and highly intelligent study on the mechanism of structural changes in scoliosis The theory which he propounds may be called that of pressure epiphysitis with resulting wedging and rotation of the vertebral bodies This deformity can only take place during the growing years.

It has been shown that scoliosis follows thoracoplasty, with the curve convex toward the side with the disrupted thoracic cage. In the adult this results in a mild lateral curvature of less than 15 degrees, a matter of no consequence In the child with intact vertebral epiphyses and several years of growth ahead, a bizarre and horrifying, 75-degree, lateral curvature of the spine results

Dr Arkin shows very convincingly what happens to the vertebrae in structural scoliosis and how it happens, but he leaves unanswered, I believe, the question of why it happens His summary is a masterpiece of terse statement. He merely claims that vertebral deformity of structural scoliosis may be explained by unilateral epiphyseal arrest by pressure and, although he states that vertebral epiphysitis is a related lesion, perhaps he only means that it may be.

The underlying basic cause of structural scoliosis, i e , what starts the ball rolling toward this deformity, remains unsolved Perhaps the thoracoplasty in a growing child gives some lead

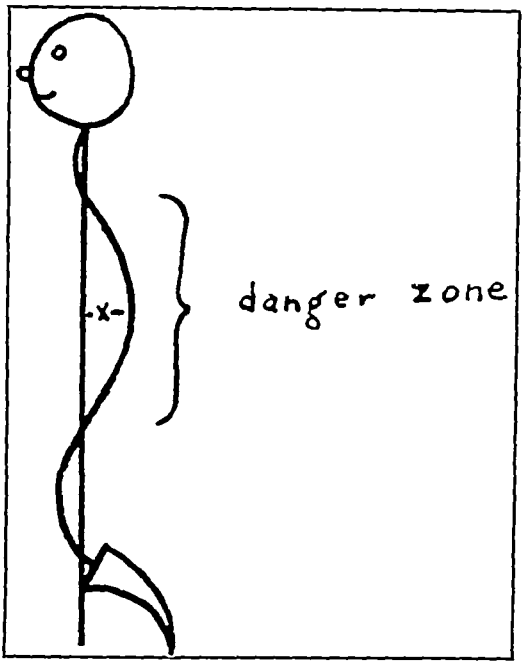

FIG 8 Anteroposterior curves of a normal spine

* It is possible that factors such as rapidity of growth heredity sex, and pathologic processes e g. rickets may modify the quantitative relationship between pressure and growth arrest

AVERAGE AGE OF PHYSICIANS DECLINES

The average age of physicians in the United States is slightly less today than it was at the outbreak of World War II, according to a report by Frank G Dickinson, Ph.D , Chicago, director of the Bureau of Medical Economic Research of the American Medical Association

This age decrease reflects the "relatively large number of physicians trained since 1940," Dr Dickinson reports. Statistics are for all physicians in the United States, including interns, residents, and doctors not in active practice The median age of the 199,745 doctors of the nation is 44.4 years. In 1940 the median age for 175,146 doctors was 45 8 years The percentage of all physicians under 50 years rose from 57 5 in 1940 to 60 2 in 1948 In the age group 35 to 49, the percentage rose from 31 4 to 36 5

"The medical population has increased 14 per cent since 1940, while the total population of the country increased only 12 per cent," Dr Dickinson points out "Each new physician is destined to remain in the medical population approximately 40 years."

Numbers of young physicians holding internships and residencies in metropolitan areas probably account for the lower median ages of physicians in thickly populated states, Dr Dickinson indicates.

"The available supply of medical service cannot be measured by crude numbers of living physicians since they include interns and residents still in training and physicians not engaged in the active practice of medicine

"An adequate inventory of medical service must also include an evaluation of the contributions of the large force of technicians and medical assistants who enable the modern physician to render far more medical service than was possible only a decade ago "

It will be noted in a radiograph of a scoliotic spine that, as the spine begins to recurve, the disks begin to be compressed on the opposite side of the bodies and on the concave side of the new curve (*d* and *f* in Fig 6) Pressure is thus falling on the corners of the bodies at point *f*, distraction is present at *d* This leads to inhibition of growth at *f* with wedging of the vertebra and conversion of the "functional" compensatory curve into a "structural" curve (Fig 7)

It must be understood the superincumbent curve need not be structural (wedged) in order to initiate the development of a functional counter curve Many purely functional curves have functional counter curves which have developed concurrently with them They have never deviated sufficiently from the weight-bearing line to cause wedging, and these well-compensated curves are usually static and do not progress to a structural scoliosis

Steindler has noted that, when structural scoliosis is arrested spontaneously, it is by the natural development of compensatory curves [2] His compensation treatment is designed to aid the development of this process, which, of course, is the principal means of correction in all methods of treatment, since the wedged apical vertebrae cannot be corrected He states "that a spine, well compensated by the development of a triple scoliosis, well-aligned, maintaining its balance under favorable conditions, is a matter of almost daily experience "[2]

An examination of Fig 7 will demonstrate why this is successful A factor determining the amount of weight acting upon the corner of the vertebral body, as shown earlier, is the *x* distance Compensation diminishes this distance and therefore diminishes the compression of the epiphysis It is to be remembered that Haas showed that growth resumed when compression was removed [1] Hence, with both sides of the epiphysis growing the deformity does not progress

Risser uses this principle in his method of treatment of scoliosis He has noted that by forcibly recurving the ends of the scoliotic curve he can produce wedging of the vertebrae (at point *f* in Fig 7), realizing that this is due to inhibition of growth by pressure

Figure 8 reveals the anteroposterior curves of the normal spine It will be noted that in the cervical and lumbar regions the normal lordosis relieves the anterior parts of these regions of the spine (the vertebral bodies) from part of the superincumbent weight, throwing it more upon the posterior articular facets This explains why the region from approximately the second thoracic to the second lumbar vertebra is the danger zone for the development of scoliosis The cervical vertebrae are practically never wedged The lumbar vertebrae are only partially protected, due to the greater superincumbent weight they carry (and due also to the forward displacement of the line of gravity in low dorsal kyphoscoliosis), but, at any rate, are sufficiently protected so that they rarely become wedged despite the frequency of functional curves due to inequality of leg length.

Hence, when the *x* distance is increased by habitual postural kyphosis, excessive weight is thrown upon the dorsal vertebral bodies It is suggested that the epiphyseal rings, which appear at about the fourteenth year of life, are compressed by this mechanism, leading to "vertebral epiphysitis" or adolescent kyphosis

Comment

It has been shown how a functional, non-wedged curve can progress into a fixed structural scoliosis The etiology of the preceding functional curve is not within the scope of this paper However, it may be assumed that the initiating cause of the functional curve may, in some cases at least, continue to contribute to the structural scoliosis which follows

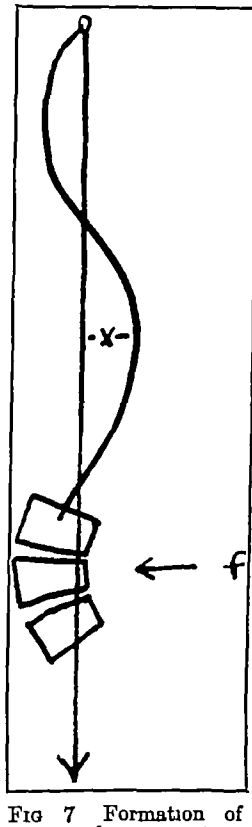

Fig 7 Formation of structural compensatory curve

Whatever the cause of the functional curve, as soon as it has produced a deviation exceeding a certain critical value, the factors described in this paper come into play, and the spine has embarked on the downward path of epiphyseal compression and structural scoliosis *

Some comment may be made about methods of treatment Obviously, the best treatment is prevention by correcting postural deviations, whether in the anteroposterior and/or the lateral plane, before they progress to structural changes In a severe curve, plaster jackets and braces cannot completely relieve the epiphysis of the pressure induced by the superincumbent weight, tremendously multiplied as it is by the mechanical arrangement which obtains Recumbency, of course,

The duration of symptoms would be expected to bear some relation to the extent of disease and thereby to prognosis Table 4 indicates the duration of symptoms in terms of months and years

TABLE 4.—DURATION OF SYMPTOMS

Duration	Number of Patients	Per Cent
0 months	10	3 0
0–2 months	90	27 5
2–6 months	129	39 4
6–12 months	57	17 3
1–2 years	32	9 8
2+ years	9	2 7
No information	1	0 3
Total	328	100 0

Of those who had symptoms 70 per cent had had them for over two months About 30 per cent gave a history of over six months duration However, only 19 of the 90 cases with symptoms of less than two months were in grade I This has definite implications when considering the necessity of regular routine physical examination. Among others, Schmitz and Healy and Twombly have noted the lack of correlation between duration of symptoms and extent of disease [5,6]

Classification

Epidermoid carcinoma was diagnosed in 306, or 93 per cent, and adenocarcinoma in 22, or 7 per cent, which corresponds to the percentage of these two classes reported generally Adenocarcinoma, in this group, carried a poorer prognosis than the group as a whole, since only 3, or 13 6 per cent of the 22, were alive or accounted for at five years This is not the universal experience, however, since Baclesse and Fernandez found a five-year survival of 24 per cent in 420 cases treated by radiation, as reported in the literature [7]

The highest incidence of adenocarcinoma occurred in the sixth decade One patient only was under the age of forty

Cervical Stump

Cancer occurred in the cervical stump in 11, or 3 4 per cent of these cases This is similar to the incidence reported by Cosbie and Martzloff [8,9] The five-year survival in the cervical stump group was only 9 1 per cent, which is far below that of the series considered as a whole, and it is lower than that reported by others Healy and Arneson, Fricke and Bowing, and Cantril and Buschke report a total of 132 cases of carcinoma of the cervical stump with a five-year survival rate of 22 7 per cent [10–12]

Complicating Diseases

A variety of diseases were present in these patients, alone or in combination, in addition to carcinoma of the cervix Cardiovascular disease was found in 36, syphilis in 18, diabetes in ten, other malignancies in 13, and other diseases which would affect expectancy in 26 patients

One of the patients in this group was eight months pregnant at the time of diagnosis of carcinoma of the cervix The fetus was delivered by cesarean section, following which a complete course of radiation therapy was given She died, however, of generalized metastases fourteen months after diagnosis

Clinical Grade

All of the clinical grading was done by one of us, (S.R.S) using the 1938 League of Nations classification Grade I included 58 (17 7 per cent), grade II, 83 (25 3 per cent), grade III, 107 (32 6 per cent), and grade IV, 80 (24 4 per cent) of the cases These are listed in Table 5 according to each of the year periods into which the study is divided

Radiation Therapy

The methods of radiation therapy separated themselves into three fairly well defined periods that from 1926 through 1932, from 1933 through 1937, and from 1938 through 1942

The radiation therapy of the first period was characterized by the use of large amounts of radium for relatively short periods of time with repeated applications The total number of milligram hours was high Thirty per cent had over 10,000 mg hrs and 70 per cent over 7,000 mg hrs The roentgen radiation was given by the massive dose method at widely separated and irregular times Ninety-four per cent of these patients received over 400 r to each of two fields per treatment Also the total doses were small, since 65 per cent had less than 7,000 r (All doses are given as air measurements)

The radiation therapy of the second period is characterized by wide variations in the dosage of radium and roentgen radiation Sixty per cent of the patients received less than 4,000 mg hrs, while 13 per cent received over 8,000 mg hrs The roentgen radiation was largely given by the massive dose method but of relatively low total dose The dosage in 94 per cent of the treatments in this period was 400 r or more per field, and usually two fields were treated each day The total roentgen dose varied from 3,000 to 10,000 r, but at least 82 per cent of the patients received less than 7,000 r

The method of radiation therapy of the third period was the one popularized in this country by the group at Memorial Hospital [13,14] It was characterized by the use of smaller amounts of radium with better distribution and greater protraction of application The total dose in milligram hours was less, since 86 per cent of the patients in this period received between 4,500 and

CARCINOMA OF THE CERVIX UTERI

A Study of 328 Cases

JOHN W KARR, M D , A L GROHOWSKI, M D , G J BARON, M D , T B STEINHAUSEN, M D , and S R SNOW, JR , M D , Rochester, New York

(From the Departments of Radiology and Obstetrics and Gynecology of the University of Rochester, School of Medicine and Dentistry, and Strong Memorial Hospital)

THE present study is the first one made of the cases of carcinoma of the cervix from the Strong Memorial and Rochester Municipal Hospitals The period of this study extends from the time of the opening of the hospitals in January, 1926, to the end of December, 1942 During this time about 200,000 patients were registered A pathologic diagnosis of carcinoma of the cervix was made in 397 cases which constitutes 55 per cent of the primary carcinomas of the female genital system diagnosed in this period This is somewhat lower than the percentages reported by Miller and Schmitz who gave 65 8 and 79 0 per cent, respectively [1 2] The present study is limited to those cases which received all of their radiation therapy in the departments of radiology of the hospitals and consists of 328 cases

The cases are grouped according to age, marital status, parity, symptoms and their duration cervical stump, complicating diseases, clinical grade, method and time of treatment Survival rates are given as they may be affected by these variables The survival rates are calculated without regard to the cause of death, since in many it was unknown Also all those in whom there was an incomplete follow-up were considered as having died within five years

Comparative Data

Age Distribution

Table 1 gives the distribution of the cases according to the age in decades

TABLE 1 —AGE DISTRIBUTION AND SURVIVAL

Age	Number of Patients	5-Year Survival Number	5-Year Survival Per Cent
20–29	4	1	25 0
30–39	42	12	28 6
40–49	103	28	27 1
50–59	106	27	25 5
60–69	54	15	27 8
70–79	17	2	11 7
80–89	2	1	50 0
Total	328	86	26 8

The age span is from twenty-three to eighty-seven, and the distribution shows 64 per cent to be in the fifth and sixth decades and 86 per cent to be above the age of forty This is in accord with the age distribution generally reported.[3] The distribution curve of the clinical grade in relation to age was quite smooth except for a slightly greater percentage of grade III in the sixth decade The survival rates show no marked variation except in the eighth decade where there is an expected drop, since survival under any circumstance is somewhat limited

Marriage and Parity

Three hundred nine, or 94 4 per cent, of these patients were or had been married, 19, or 5 6 per cent, were single The distribution according to the number of pregnancies is shown in Table 2

TABLE 2 —PARITY

Number of Pregnancies	Number of Cases	Per Cent
None	55	16 8
1 to 4	170	51 8
5 or more	95	29 0
Not given	8	2 4
Total	328	100 0

The disease occurred about five times as frequently in the parous as in their nulliparous sisters, yet it occurs in a significant number of the latter group Bowing and McCullough and Hurdon report about the same distribution in much larger series [4,5]

Symptoms and Their Duration

Since some change in the normal course of events is the thing which brings the woman to the physician, the nature of this change is of great importance in this serious disease Table 3 lists the name and distribution of the symptoms reported in this series

TABLE 3 —SYMPTOMS

Symptom	Number	Per Cent
Vaginal bleeding—alone or with other	272	83 0
Pain—alone or with other	41	12 5
Leucorrhea—alone or with other	37	11 3
None	10	3 5
No information	7	2 1

It is apparent that the principal danger signal is abnormal vaginal bleeding Pain and vaginal discharge occur with about equal frequency, although pain may be indicative of a more advanced stage of the disease It is significant that ten of these patients had no symptoms

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Radiology May 21 1948

grade by the year period, and the totals for each grade

Table 6 gives the totals for each of the year periods with five- and ten-year survivals Again it must be mentioned that deaths from whatever cause and all not followed cases are considered as dead of disease within five years

These tables reveal a five-year survival of 69 0 per cent in grade I, 30 1 per cent in grade II, 15 9 per cent in grade III, and 5 0 per cent in grade IV with a total five-year salvage of 26 2 per cent This compares with a five-year salvage of 27 4 per cent taken from the combined data covering 16,385 cases reported by Tod, Schmitz, Smith and Dresser, and Ingelman-Sunderberg [11–13 17]

From Table 6 it is seen that there was a progressively increasing five-year salvage from 13 0 to 26 05 to 37 5 per cent in the three periods This corresponds to the progressive increase in five-year salvage reported by others, among whom are Hurdon, Smith and Dresser, Heyman, Jacoby, and Richards There is also an increase in the number of those with grade I in the third period compared with either of the other two periods

Clinical grade is the chief controlling factor of five-year survival as demonstrated by the progressive drop from 69 per cent in grade I to 30 1 per cent in grade II to 15 9 per cent in grade III to 5 0 per cent in grade IV

Summary and Conclusions

This is a presentation of a series of 328 proved cases of carcinoma of the cervix uteri seen between 1926 and 1942 which received all radiation therapy in our hospitals The greatest incidence occurred in the fifth and sixth decades The age of the patient did not greatly affect the five-year survival. Abnormal vaginal bleeding was the most common symptom. Duration of symptoms was not indicative of the extent of the disease

Epidermoid carcinoma was the classification of 93 and adenocarcinoma of 7 per cent Adenocarcinoma carried a less favorable prognosis, as did carcinoma occurring in the cervical stump Seventeen and seven-tenths per cent of these cases were grade I, 25 3 per cent were grade II, 32 6 per cent grade III, and 24 4 per cent were found to be grade IV The five-year salvage for these grades was 69 0, 30 1, 15 9 and 5 0 per cent, respectively The five-year salvage for all cases was 26 2 per cent

Complications of treatment and/or disease were most common in the first period of the study There was a gratifying progressive increase in the five-year survival rate from the first to final period More early cases were seen in the last period than in either of the earlier ones, which is most encouraging

Routine physical examinations and the use of cancer detection clinics will bring in more early cases for treatment with a consequent higher salvage The intelligent use of improved radiation technics and equipment should lead further toward the same goal

Discussion

S R. Snow, Jr, M D, *Rochester*—As Doctor Karr has stated, this is the first comprehensive statistical study of carcinoma of the cervix at the Strong Memorial Hospital The yearly five- and ten-year arrests have been reported to our local cancer society for the last fifteen years

The core of the investigation is in the last two periods The first period covers the years in which the school was starting, organization was not too complete and the school at times a dumping ground for many hopelessly advanced cases Anyone who has worked in the tumor clinic looks with a sigh of relief at the end results of the last two periods They are better than he had dared hope, although they leave much to be desired.

It should be stressed that all of these are cases of gross cancer There are no cases of noninvasive cancer, there are no cases where cancer was found in a removed cervix There are few, if any, cases where recuts were necessary to establish the diagnosis The great majority were diagnosed in searching a single slide This knowledge is important when one attempts to evaluate the results of any form of treatment

It was startling to see the number of grades II and III listed among those having symptoms of only one or two months As has been pointed out, this finding stresses the need for the many detection clinics springing up throughout the country

The study well illustrates the value of the so-called protracted dosage treatment, the latter having been adopted near the end of the second period That we are for the great part merely arresting the disease is attested to by the ten-year survivals—9 per cent in the first, 10 2 per cent in the second period, for a total of 9 6 per cent ten-year arrests in the first two periods The ten-year survivals for the third period will probably be greater

It can be stated that the treatment for carcinoma of the cervix at the Strong Memorial Hospital has been and will be, in the immediate future, radium and x-ray By closer cooperation between individuals of the gynecologic and x-ray departments, particularly with reference to better distribution of radium through the use of a greater variety of applicators, whose choice will be determined and make-up accomplished after examination of the patient under anesthesia, it is hoped that we shall be able to show a greater improvement in future results

The discovery of noninvasive or early invasive

Credit is due Dr Andrew H Dowdy recently professor of radiology University of Rochester and Strong Memorial Hospital and now professor of radiology University of California at Los Angeles for his inspiration and assistance in this study

Also credit is to be given to the Division of Statistics of the Department of Radiology of the University of Rochester

5,500 mg hrs Roentgen radiation was given using smaller doses per treatment and over a greater period of time, with a higher total dose Eighty-six per cent received 200 r to two fields per treatment, and over 80 per cent of the patients received more than 7,000 r total

The technical factors of the roentgen radiation, used in all three periods, showed variations in kilovoltage peak of 180 to 220 and milliamperes of 10 to 25, filtration was constant at 0 5 mm copper and 1 0 mm aluminum added The skin target distance varied from 50 to 70 cm Considerable variation occurred in the size and number of fields treated The size varied from 10 by 12 cm to 25 by 25 cm The number of fields used varied from one to six

It is important to note that roentgen radiation was given before radium in 75 per cent of the cases in the third period and in 59 per cent of the cases in the second period, while in the first period only 10 per cent were treated in this manner Only 5 per cent of the cases of the third period were treated by radium alone, while the second and first periods showed 10 and 17 per cent, respectively Those variations in method are well described by O'Brien in his historical review of treatment of carcinoma of the cervix [15]

It is believed that the complications of treatment, the complications of treatment and/or disease, and the survival rates are profoundly affected by these variations in method

Complications

The primary complications of therapy were more common in the first period, with some reduction in the second and a marked falling off in the third period

Major complications, such as fistulas, intestinal obstruction, ureteral stenosis, and pelvic abscess, cannot all be ascribed to therapy, since these can be natural consequences of the disease as has been shown by Sackett, Ingelman-Sunderberg, and Den Hoed, among others [16–18] Radiation therapy, however, cannot avoid some share of responsibility It is noteworthy that 58 major complications occurred in the first period, 40 in the second, and only 17 in the third When this is compared with the number of patients in the various periods (Table 6), this difference becomes more striking It is felt too that the difference in the number of advanced cases in the three periods can scarcely account for this discrepancy in number of major complications This problem receives more adequate discussion by Ingelman-Sunderberg and Corscaden *et al* [17 19]

The complication of fracture of the upper femur, so often emphasized, occurred three times in this series of 328 cases However, two of these were due entirely to trauma Radiation necrosis of the proximal femur was held to be responsible in one This gives a percentage of 0 3 per cent which corresponds with that reported by Stamfli and Kerr in their analysis of 1,372 cases [16] We continue to use lateral ports

Results

Results are given in Tables 5 and 6 Table 5 shows the distribution by grade and year period, the five- and ten-year survival rates for each

TABLE 5 —DISTRIBUTION OF CASES ACCORDING TO GRADE AND PERIOD

Grade	Year Period	Cases Number	Cases Per Cent	Five-Year Survival Number	Five-Year Survival Per Cent	Ten Year Survival Number	Ten Year Survival Per Cent

The discovery of noninvasive or early invasive

Credit is due Dr Andrew H Dowds recently professor of radiology University of Rochester and Strong Memorial Hospital and now professor of radiology University of California at Los Angeles for his inspiration and assistance in this study

Also credit is to be given to the Division of Statistics of the Department of Radiology of the University of Rochester

cases through detection clinics will undoubtedly increase survival rates in the future Every effort must be directed toward improving the methods of treatment, and thereby the cure rates, in these cases of so-called gross carcinoma of the cervix, since it will be years before they become a rarity

VA REPORT ON "HOME TOWN" MEDICAL CARE IN 1948

An annual report just released by the Veterans Administration reveals that during the fiscal year ended June 30, 1948, private physicians treated 761,165 veterans under arrangements with the Veterans Administration. For their services they received $11,437,739 for a total of 2,735,429 treatments. Thus, the average cost per treatment was $4.18 and the cost per veteran, for the twelve-month period, was $15 03

In the same period, Veterans Administration staff doctors at outpatient clinics administered 1,680,183 treatments to 865,004 veterans For the first quarter of the present fiscal year (July, August, and September, 1948), the number of cases handled—both by private physicans and Veterans Administration staff men—ran about 30 per cent behind the figure for the corresponding period in 1947—*J A M A, December 25, 1948*

THE NATIONAL HEALTH SERVICE

APPLICATION FOR PERMIT TO BE ILL

ame No Age
ddress

1 I hereby make application for a permit to be ill
2 I declare (*a*) that I have a pain in my
(i) Head (ii) Chest
(iii) Stomach (iv) Legs
(v) Arms (vi)
(*b*) that my complexion is (i) ruddy, (ii) pallid, (iii) green
(*c*) that I have broken my (i) arm, (ii) leg, (iii) back, (iv) engagement.
(*d*) that during the past twelve hours I have been sick times
(*e*) that I expect to be sick again in hours
(*f*) that I am afraid I shall (i) die, (ii) not die, (iii) live, (iv) not live.
(*g*) that I am off (i) food, (ii) drink
3 The name of my doctor/veterinary surgeon is
4 I am in (i) bed, (ii) pain, (iii) desperation, (iv) my coffin.
5 What is the effect of a dose of cascara? How many times?
6 I can see (i) spots, (ii) nothing, (iii) animals (state what type and color)
7 I have spots on my They do/do not itch
8 I am/am not pregnant (in the case of a male applicant further details may be given on a separate sheet)
9 I am (i) depressed, (ii) elated, (iii) about to shoot myself (Note in this case a firearms license is required)

This form when completed, should be submitted in triplicate to the local Health Officer Should the applicant die before the permit is issued the local Health Officer should be notified and a fresh application for a permit to be declared dead should be submitted by a relative or creditor
Permits are not transferable but a permit for a common cold may be used by all members of an applicant's family provided that all the colds, up to a maximum of six, are caught within 14 days of the date of the permit.

DECLARATION I declare that all the particulars given above are true and that I am as well as can be expected.

THE ORTHOPEDIC MANAGEMENT OF FOOT PROBLEMS IN CHILDREN

FREDERICK LEB LIEBOLT, M D , New York City

(From the Department of Surgery (Orthopedics) of the New York Hospital-Cornell Medical Center)

WHEN a newborn child is presented to the mother, one of her first acts is to examine the child's feet This is because of long apprehension concerning possible deformities of the feet and because the foot is an organ which can be seen and examined The mother's next period of interest occurs at the time the child begins to walk and is caused by her consciousness of the ordinary foot complaints in everyday life *It is the pediatrician* who is called upon to examine the feet at birth and again upon walking, making it necessary for him to understand the common foot problems in children and, in a large sense, to be able to treat and to give advice concerning the various conditions Not to do so may not only displease the mother but also may allow the little patients to be exploited and preyed upon by shoe salesmen, advertising agencies, and other unqualified nonprofessional groups To assist the pediatrician with the various foot problems, discussion is to be from a practical standpoint and limited to diagnosis and treatment without mention of theory, etiology, or unnecessary detail

Diagnosis and Treatment

Weak Foot.—This condition is one in which the longitudinal arch of the foot is relaxed (Fig 1) Other terms denoting the same condition are flat foot, flexible foot, strained foot, and static foot The diagnosis is established when the longitudinal arch is decreased and dorsiflexion of the foot is 15 to 30 degrees less than a right angle Most children are born with such findings, but the feet of about one half will develop normally without treatment Inasmuch as it cannot be determined in advance which group will develop normally, it is wise to *do nothing until the child begins to* walk Should the findings persist, a prescription should be given for well-made, solid leather shoes with thick soles, wedged 1/8 inch on the inner heel and 1/8 inch on the outer sole, the wedges to be placed outside and not inside the shoe Either high or low cut shoes may be prescribed, but booties, artificial leather, and soft sole shoes never should be used The child should not be allowed to go barefoot for any period of time The prognosis in such cases is good

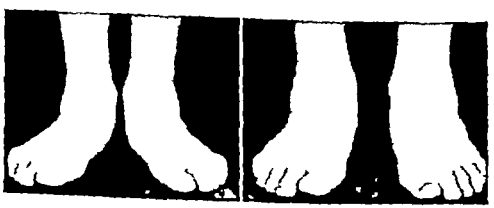

FIG 1 Weak feet Note on left that longitudinal arches are relaxed and on right patient is elevating the arches but cannot do so completely (compared with fig 5)

Talipes Calcaneovalgus —This condition is a severe, congenital form of weak foot Dorsiflexion of such feet often is 30 to 45 degrees less than a right angle, frequently allowing the dorsum of the foot to be pushed up and against the tibia, making the calcaneum prominent (Fig 2) At the same time the foot is everted, producing valgus and pronation (Fig 3) Often at birth the feet are fixed in dorsiflexion and eversion, causing alarm to the mother Academically, the condition belongs to the family of clubfeet, but this term should never be used to the layman because it stigmatizes the child for life for, in reality, the condition is nothing more than a severe type of weak foot At birth such feet may well be left alone, or at best, for reassurance, the mother may stretch the feet downward each time the diapers are changed The use of plaster casts, wedgings, braces, and splints are of no more value than

FIG 2 Talipes calcaneovalgus Excessive dorsiflexion allows dorsum of feet to reach the tibiae

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Pediatrics May 20 1943.

This study was aided by a grant from the Marie Heye Clemens Fund, Inc.

cases through detection clinics will undoubtedly increase survival rates in the future Every effort must be directed toward improving the methods of treatment, and thereby the cure rates, in these cases of so-called gross carcinoma of the cervix, since it will be years before they become a rarity

FIG 6 Cavus foot—high longitudinal arch hyperextension of metatarsophalangeal joints, and flexion of interphalangeal joints

metatarsal bars, and stretching exercises are useful in the early conservative treatment Later, transplantation of the long toe extensor tendons is indicated, and if, in addition, bony deformity is present, subtalar arthrodesis must be added

Köhler's Disease—This condition is an osteochondritis or inflammatory reaction resulting in flattening, condensation, and irregularity of the tarsal navicular (scaphoid) bone due to aseptic necrosis (Fig 7) [1] It occurs in children between five and ten years of age The symptoms consist of pain upon walking and tenderness over the navicular bone, often associated with redness and swelling The diagnosis is confirmed by x-rays Treatment consists of hot epsom salt soaks and massage for the pain and swelling and a monel metal or aluminum arch made from a plaster mold to fit and support the foot Inactivity, immobilization, and plaster casts are not necessary, and complete spontaneous recovery is the rule

Freiberg's Disease—This is another member of the family of osteochondroses which affect the feet of children [2] It is a progressive flattening of a metatarsal head, generally the second or third, due to a circulatory disturbance producing aseptic necrosis with fibrous tissue replacing the bone tissue (Fig 8) Gradually the metatarsal head develops a flat and deformed contour with increased calcification, a projecting bony rim, and, frequently, loose bodies The early symptoms are pain, swelling, and redness, and the late symptoms are those of metatarsalgia or pain in the metatarsal area of the foot Examination early reveals tenderness and swelling localized to a metatarsal head and, later, a palpable bony rim extending around the head and associated with slight shortness of the toe Early treatment should consist of hot epsom salt soaks, massage, and a metatarsal pad or metatarsal bar applied to the shoe or to an insole Again, immobilization is not necessary, for it has been shown to have no effect on the progress of the disease Later, surgery may be necessary in the form of excision of the bony rim of the metatarsal head, removal of loose bodies from the joint, or in some cases resection of the head of the metatarsal bone

FIG 8 Freiberg's disease Note flattening, calcification, bony rim, and loose bodies at third metatarsal head on the right

Calcaneal Apophysitis—This is an osteochondritis of the calcaneal tubercle and belongs to the group of osteochondroses (Fig 9) The symptom is pain at the insertion of the calcaneal tendon with the examination revealing an enlarged, mildly tender, calcaneal tubercle Treatment consists of hot epsom salt soaks and massage to relieve the pain and tenderness at the tubercle and elevation of the heel of the shoe to relieve the pull of the calcaneal tendon at its insertion Immobiliza-

FIG 7 Köhler's disease Note flattening, condensation, and irregularity of the navicular bone

FIG 9 Calcaneal apophysitis Note soft tissue swelling and irregularity at calcaneal epiphysis which is difficult to see in reproduced photograph

FIG 3 Talipes Calcaneovalgus Excessive relaxation of longitudinal arches and eversion of feet produce valgus and pronation

passive stretching, in fact, without any treatment the feet will resume normal position Upon walking the same treatment described above for weak feet should be employed, but no promises should be made as to prognosis because the congenital type of weak feet do not develop normal longitudinal arches The use of naviculocuneiform arthrodesis (surgical fusion of the two bones at the apex of the longitudinal arch) at about ten years of age when the bones are developed sufficiently is a well recognized procedure and quite useful in preventing symptoms later in adult life

Plantar Flexed Talus —This term is applied to a congenital deformity in which the talus (astragalus) is deviated excessively toward the sole of the foot (Fig 4) The talus carries with it the navicular bone producing a marked flattening of the longitudinal arch The diagnosis may be suspected if the longitudinal arch appears reversed like the rocker of a rocking chair and is confirmed by x-ray studies of the feet in the standing position Unfortunately, the condition is not amenable to conservative measures This is the proper case, however, in which to use arch supports in the form of dural aluminum or monel metal (as opposed to rubber) until the bones are developed sufficiently to allow subtalar (triple) arthrodesis to be performed to avoid the symptoms of flat feet in adult life

FIG 4. Plantar flexed talus Note talus deviates excessively toward sole of foot producing rocker deformity

Pronated Foot —This term is reserved for those feet which present a good longitudinal arch but which show an internal rotation of the foot upon standing (Fig 5) The condition is the most common foot problem in children It is frequently confused with weak foot, flat foot, and weak ankles but can be differentiated from these by placing the patient in a standing position and passively rotating the foot back to a normal position beneath the tibia At this time it will be noted that the longitudinal arch remains unchanged in height and that the foot has merely rotated inward at the talocalcaneonavicular joint Likewise, because of the medial inclination of the foot and tibia with prominence of the medial malleolus the impression is often gained that the ankle joint is weak, but such is not the case Correction is ob-

FIG 5 Pronated feet Note typical internal rotation of foot on left, while on the right, patient is correcting rotation showing longitudinal arch is normal (see Fig 1)

tained by inner heel wedges of $^1/_8$ inch, changed to $^3/_{16}$ inch when the child is three or four years of age, plus exercises designed to strengthen the anterior and posterior tibial muscles This exercise is done best by raising on the toes and then slowly rolling down the outer border of the feet until the heels reach the floor, contracting the anterior and posterior tibial muscles during the procedure

Cavus Foot —This condition consists of an excessively high longitudinal arch and over active long toe extensor tendons producing hyperextension at the metatarsophalangeal joints and flexion at the interphalangeal joints (Fig 6) Such findings should cause the examiner to think in terms of heredity, short shoes, poliomyelitis, congenital lues, or neurologic conditions affecting the posterior and lateral columns of the spinal cord Metatarsal pads,

FIG 14. Hallux varus Note on the right medial deviation of first toe, while the opposite foot is normal.

FIG 15 Accessory toes Note that although each forefoot is broad and the last metatarsal bone bifurcated the six toes of each foot appear normal, and surgery is not indicated

FIG 16 Accessory toes Note that because one of the seven toes on the left foot overlies the fourth toe, surgery is indicated

treatment Correction is obtained by arthrodesing the involved interphalangeal joint with the phalanx in straight alignment

Hallux Varus —This term is applied to abduction or medial deviation of the first toe (Fig 14) Although congenital, it is more or less a normal finding in infants It produces no symptoms and does not require treatment because as soon as shoes are worn the toe will assume a straight position

Accessory Toe —Not infrequently, children are born with extra toes, and whenever the x-ray studies reveal all digits to be normal, no treatment is indicated (Fig 15) However, at times the abnormal position of the toes or the projecting segments of bone produce a deformity which is unsightly or symptomatic due to shoe pressure (Fig 16) The only treatment is amputation of the supernumerary digit, preferably at birth.

Callosities.—So-called corns develop in children only on the toes, most frequently the first and fifth. The condition is a mere protective thickening of the skin due to abnormal shoe pressure It produces no symptoms, but the mother notices the skin to be red and thickened It is an indication of improper fitting of the shoes, either too short or too narrow, and is relieved completely by obtaining larger shoes

Metatarsus Varus —The common name for this condition is pigeon toe It consists of varus or adduction of the forefoot on the rearfoot (Fig 17) The deformity may be postural or structural, and this differentiation is extremely important because of the difference in treatment and prognosis

In the postural type, examination will reveal the deformity to be flexible and to be overcorrected easily by passive manipulation. Such a condition is frequently normal in infants, but internal tibial torsion and internal rotation of the entire extremity must be ruled out The treatment consists only of applying a wedge to the outer aspect of the sole of the shoe, measuring $^1/_8$ inch in young children and $^3/_{16}$ inch in older children Upon walking such wedges automatically change the forefoot to a straight position, and the correction gradually becomes permanent

In the structural type, examination will reveal the deformity to be fixed and overcorrection by passive manipulation not possible This type of deformity belongs to the clubfoot family, requires much more extensive and involved treatment, and the prognosis for full correction is much less favorable Treat-

FIG 17 Metatarsus varus Note on the right the forefoot is adducted on the rear foot while on the left the foot is normal.

FIG 10 Hammer toes—flexion deformity at proximal interphalangeal joint of each second toe

tion and inactivity are rarely necessary The prognosis is good

Hammer Toe —The term applies to a flexion deformity of either or both of the interphalangeal joints of any toe—generally the second (Fig 10) The condition is a congenital defect which bears no relation to footwear except that short shoes are a possible cause where the second toe is longer than the first toe The complaint generally is of a cosmetic nature on the part of the parent although later a dorsal callosity may develop and become painful to the patient Splints of all types and stretching of the deformity are of no value from a curative standpoint After about ten years of age arthrodesis of the affected joint may be performed for permanent correction and relief

Web Toe —This condition is a congenital defect in which segmental differentiation of the toes fails to take place (Fig 11) The webbing may be by skin and soft tissue or by bone The web may extend only to the proximal interphalangeal joint, to the distal interphalangeal joint, or to the tip of the toes Generally speaking, the digits are distinct with the bones, joints, and nails developed normally Inasmuch as symptoms rarely develop in such toes, treatment is unnecessary except occasionally when plastic repair is performed for cosmetic reasons

FIG 11 Webbed toes Note on left failure of segmentation of second and third toes which roentgenogram on right demonstrates to be due to soft tissue only

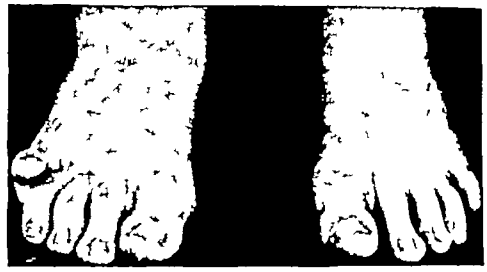

FIG 12 Subluxated fifth toe Note on left that fifth toe is displaced dorsally and adducted over the fourth toe

Overlapping Toe —This term applies to a congenital defect in which a toe is elevated above the adjacent toes, most often the second or third Splints to hold the toe in position or the strapping of the toe to an adjacent toe may be used but will not correct the condition Often the elevated toe will assume a normal position without treatment, but if the condition persists and becomes symptomatic later in life, amputation may be performed

Subluxated Fifth Toe —The condition is a congenital deformity in which the fifth toe is subluxated dorsally, rotated externally, and adducted over the fourth toe (Fig 12) In the past, surgery consisted of amputating the toe, but today the treatment of choice is to remove the contracture and straighten the toe by the Lantzounis procedure [3]

Varus Toe —This is another congenital deformity in which the distal phalanx of one or more of the lateral four toes is curved over or under the inner adjacent toe (Fig 13) Often the deformity is painful, due to weight bearing on the bottom toe or rubbing of the shoe on the top toe Generally, the deformity is fixed, preventing the use of conservative methods of

FIG 13 Varus toes—distal phalanx of each of the lateral three toes is curved under the inner adjacent toe.

CLASSIFICATION OF BONE DISEASES

I Snapper, M D , New York City

(From the Second Medical Service of Mount Sinai Hospital)

IN 1925, Mandl successfully removed a parathyroid adenoma in a patient with Recklinghausen's bone disease [1,2] This operation led to an almost complete clinical cure The patient, who had been confined to bed and who, for a long time, had been suffering excruciating pains, was soon able to get up and ultimately walked, even without the help of a cane

Mandl's discovery was, of course, received with great enthusiasm Everywhere physicians and surgeons searched for patients with Recklinghausen's bone disease, and the large number of successful operations reported in and near 1930 was, at least in part, the result of a careful culling of such patients from homes for incurable cripples in order to find as many candidates for parathyroidectomy as possible Soon it became evident that the diagnosis of Recklinghausen's bone disease required more careful criteria than the presence of a widespread or even generalized osteitis fibrosa with cyst formation as originally described by Recklinghausen.

Mandl, in his original publication, already insisted that before operation the calcium content of his patient's serum had been abnormally high and that the urine had been turbid due to excessive excretion of calcium phosphate After removal of the adenoma both these phenomena disappeared and returned to normal Other investigators elaborated upon these findings, and soon it was emphasized that Recklinghausen's bone disease is only one of the clinical entities which result when hyperparathyroidism due to hyperfunction of the parathyroids sets in.[3–5] For the diagnosis of Recklinghausen's bone disease the clinical picture, the anatomic findings in a biopsy of the bone, and the roentgenograms are of importance, but still more important is the presence of the biochemical syndrome of hyperparathyroidism This biochemical syndrome, which must be present before the diagnosis of Recklinghausen's bone disease can be made, consists of increase of the calcium content of the serum (normal 9 5 to 10 5 mg per cent), decrease of the inorganic phosphorus content of the serum (normal 3 to 4 mg per cent), excessive excretion of calcium in the urine, and excessive excretion of inorganic phosphorus in the urine

For completeness sake it may be added that when this biochemical syndrome is found, one or more parathyroid adenomas must be present, even if roentgenologic studies do not reveal clear-cut abnormalities of the skeletal structure In such cases of hyperparathyrodism without bone lesions the formation of renal stones is often the outstanding sign.[6]

Increase of the alkaline phosphatase of the serum is also a nearly constant sign of Recklinghausen's bone disease It is dependent upon the increase in bone reparation which is always present in this disease, but it is not caused by hyperparathyroidism per se

Only in patients with bone disease who exhibit the full biochemical syndrome of hyperparathyroidism is the search for a parathyroid adenoma indicated During the wave of enthusiasm which developed after Mandl's publication, many patients with cystlike areas on the roentgenograms suffered an unsuccessful exploration for a parathyroid adenoma Thus it soon became necessary to distinguish hyperparathyroidism from other bone diseases which had a certain similarity to Recklinghausen's bone disease This was the reason why in 1932 we described, together with Parisel, and in 1934, with Posthuma, two patients who, in our opinion, exhibited a syndrome which at that time was commonly diagnosed as Recklinghausen's bone disease, but which could be easily distinguished from this disease [7,8]

Case Reports

Case 1 —The first patient was a girl, ten years old, who had started to menstruate regularly when she was only seven years old When we saw her in 1932, she had already suffered five femur fractures in the course of the last three years Physical examination revealed extensive bone lesions apart from the presence of several small brown naevi on face and chest There existed gross deformities of the upper parts of both femora with swelling of both humeri Roentgenograms showed extensive cystlike areas in both femora and humeri and many other bones. A parathyroid exploration had been performed twice but without success

A biopsy in one of the pseudocystic areas showed that no actual cyst was present. There was a cavity filled with soft and friable bone tissue which at microscopic examination showed the presence of osteitis fibrosa and a few nests of xanthoma cells filled with double refracting particles, that is, cholesterol esters. After decalcification, bone trabeculae were found, between which fibrous marrow was present. In some areas, rows of osteoclasts adjacent to bone trabeculae were present.

This patient died in 1936 of a fibrosarcoma of the femur

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Radiology May 21 1948.

FIG 18 Talipes equinovarus—a true clubfoot on the left and a normal foot on the right.

ment should consist of wedging plaster casts in which the forefoot is forced gradually into a position of overcorrection and held there for six weeks

Talipes Equinovarus—This is the medical term for true clubfoot, and the colloquial term, "clubfoot," should be reserved for this type of deformity only It is an inherited and congenital deformity of a severe type (Fig 18) The prognosis for cure always must be guarded The diagnosis is established by the possible history of similar deformities in the family and the physical findings of a fixed deformity in which the forefoot is turned in, the heel drawn up, and the foot held in inversion and plantar flexion In those cases in which the diagnosis is difficult because the degree of deformity is mild, a simple method of establishing the diagnosis is to palpate the space between the navicular tubercle and the medial malleolus In the normal foot this space is the width of the little finger, and the two bones are never approximated, while in all true clubfeet the space is decreased in width, and often the two bones are in direct approximation The treatment of clubfeet is tedious, difficult, and highly technical It should be instituted at birth, even while the baby is still in the hospital, because the ease and degree of correction is related closely to the age of the patient Although many types of treatment have been and are being used, the most dependable and best established method for correction is to apply and to wedge plaster casts after the method of Kite [4] Surgery today is reserved for residual deformities later in life

Summary

Brief comments on the practical aspects concerning diagnosis and treatment of the ordinary foot problems in children is presented to the pediatrician

Discussion

Fred W Bush, M D, *Rochester*—The field of the pediatrician in the management of foot problems is closely linked to the orthopedic surgeon, in that early recognition and early orthopedic care of congenital malformations of the feet are very necessary to their correction Conditions requiring treatment must be recognized before contractions begin to take place in the ligamentous structures which would markedly increase the difficulty in manipulation and correction Every newborn infant should have a careful examination of his feet I agree with Dr Liebolt that many feet in the newborn that show bizarre positions frequently correct spontaneously What we, as pediatricians, are particularly interested in is the foot described as weak foot and pronated foot As children begin to stand, all show some degree of weakness—flat feet being universal Accompanying this in some cases is pronation and pigeon toe, whereas some cases are definitely what we feel are congenitally flat feet I agree that at least 50 per cent of the weak feet will correct themselves regardless of the type of shoe or treatment instituted In my experience congenital flat feet are usually painless and symptomless, and since they often remain so, my practice is to disregard them unless the child complains of leg aches The early shoes many pediatricians recommend are soft soled, flexible shoes I use these with no correction unless symptoms are present until the child is about three years of age, at which time a sponge rubber cookie for the longitudinal arch or wedging of the inner surface of the heel is advised This is done if the feet are not making progress or if the child complains of being tired after walking a short distance At this time exercises such as picking up marbles tiptoe games, and up-on-the-toes exercises are recommended I would be interested in Dr Liebolt's opinion of the moccasin type shoe and the various flexible soled shoes for children up to three years of age

I endorse the idea that it is our job to protect our patients from being exploited by shoe salesmen and shoemakers, and I feel very strongly that our examination should include advice as to foot care

The anomalies—webbed toes, accessory toes, hammer toes, crowded and overlapping toes—have been fully covered, and I am in agreement with the treatment offered The cases requiring surgery, however, are seen early more frequently by the orthopedic surgeon, I am sure, as are the cases in which the pediatrician finds himself at a loss to explain the pain of osteochrondritis of any of the bones of the foot

addition, Jaffe has reported that occasionally one of the lesions may show exuberant growth and thus lead to the formation of a large tumor-like mass [14]

Jaffe and Lichtenstein carefully described the pathology of the disease [15] They emphasized that the cystlike areas are not actually cystic In these lesions the bone is replaced by a yellow-white fibrous tissue which is often gritty in character due to the presence of minute spicules of bone. The connective tissue is often arranged in characteristic whorls The bone spicules consist of trabeculae of partly calcified, newly formed bone which is formed by direct metaplasia of connective tissue As mentioned by Schlumberger, even the more mature trabeculae are deeply penetrated by bundles of collagenous fibers [16] Much less frequently, fiber bone and islets of cartilage are found within the lesion

It should be added that several investigators have confirmed our original observation of the presence of large islands of xanthoma cells in the areas of coarse fibrous tissue which replace the bone marrow Adams, Compere, and Jerome in one case stated that the pseudocystic lesion contained loose fibrous tissue and nests of xanthoma or foam cells [17] Coleman reported an autopsy case where, apart from the bone lesions near the hilum of the kidney, several irregular yellow masses were found [18] These masses were soft, ill-defined, not vascular, and resembled lipoid masses, somewhat like cortical substance of the adrenal glands Windholz mentions groups of xanthoma cells visible in the vicinity of blood vessels of which he presents an excellent picture [19] Albright and also Jaffe and Lichtenstein have always been of the opinion that these islands do not represent a primary lipoid granulomatosis The formation of the xanthoma cells was, in their opinion, secondary to the original pathologic lesions Windholz believes that the xanthoma cells indicate resorption of fatty material from the tissue of the dysplastic focus

Whereas we characterized this disease as a granuloma with tendency to xanthomatous infiltration, and thereby as a variation of Hand-Schüller-Christian's disease, Albright postulated a malformation of the central nervous system. Lichtenstein and Jaffe suggest that a developmental defect of the bone-forming mesenchyma may be the cause of this syndrome They are inclined to consider the individual bone lesions as tumor-like malformations resulting from flaws of development and characterized by defects of tissue combination. Thannhauser defended the opinion that a close relation exists between this disease and neurofibromatosis [20]

In many excellent articles on these remarkable skeletal lesions Albright and Jaffe have always insisted that this disease is a separate entity and that it is easy to distinguish between actual lipoid granulomatosis of the bones and the disease which is nowadays described as Albright's disease or polyostotic fibrous dysplasia Thus, in the course of years the differentiation of this clinical entity from Recklinghausen's disease of the bone has become less important than the speculations about its pathogenesis

Reviewing the data available in the literature, it must be conceded that no observer has reported gross areas of xanthoma tissue in patients with polyostotic fibrous dysplasia in whom pigmentation, precocious puberty, or segmental distribution of bone lesions were found at the same time. In one autopsy of a patient with fibrous dysplasia, reported by Sternberg and Joseph, careful anatomic examination failed to reveal the presence of lipoid granuloma [21] The bones of the right humerus and femur were examined, and no trace of lipoid granuloma was found In another autopsy which has not yet been reported in detail only two islands of xanthoma cells were found [22] Pigmentations with irregular edges and premature menarche have not been found in genuine cases of lipoid granulomatosis and favor the diagnosis of polyostotic fibrous dysplasia Albright has especially emphasized that, in the latter disease, on the roentgenograms not only bone destruction but also increased bone formation can be visualized, in lipoid granulomatosis hyperostosis or osteosclerosis allegedly does not occur [22] Jaffe has insisted that thickening and overgrowth of bone at the occipital squama, which, by the way, our very first patient in 1932 also showed, is of considerable importance for the diagnosis of polyostotic fibrous dysplasia [23]

Regardless of the question whether this syndrome is closely connected with xanthomatosis of the bones or not, these different diagnostic criteria are not always foolproof As originally defended, cases of burnt-out lipoid granulomatosis may be diagnosed as polyostotic fibrous dysplasia Such was the case in the patient described below

Case 3 —A thirty-one-year-old man was admitted in October, 1945 The actual complaint was right lower back pain of four months duration. Since the age of fourteen he had suffered several pathologic fractures In 1928 he broke his right thigh after a fall on the stairs, in 1929, he broke his left thigh while at play, in 1930, he broke his left tibia and fibula after minor exertion, in 1936, he broke his left fifth metatarsal while stepping from the curb onto the pavement. For the last six years he had been complaining of crampy sensations in the calves For twelve years he had had a swelling of the left lower jaw at one of the incisors Nothing in the history suggested the presence of diabetes insipidus or other endocrinologic disturbances. There were no bone diseases in the family Physical examination

Case 2.—The second patient was a man of thirty-five years whom we first observed in 1934. From the age of eleven till date of admission he had suffered two spontaneous fractures of the left upper arm, of the right upper arm, and of one finger Examination showed, apart from several large pigmented areas of the mucous membrane of lips and mouth, multiple lesions of the skeleton The face was asymmetric, there was considerable swelling of the right frontal bone above the superciliary arch, and roentgenologic examination showed the presence of extensive cystlike areas with thinning of the cortex in both humeri, in the right radius, in the scapula, in the left femur, and in the right calcaneus bone At the time we stressed the absence of hypercalcemia and hypercalciuria. In addition, we emphasized that, apart from the osteolytic cystlike areas, there was no thinning of the cortex of the bone of the rest of the skeleton In Recklinghausen's bone disease the osteitis fibrosa is generalized and also leads to a decalcification and destruction of the cortex of the skeleton in areas where no cystic degeneration has occurred

In view of the biochemical findings this patient could not suffer from hyperparathyroidism nor, therefore, from Recklinghausen's bone disease This was further confirmed at exploration when the parathyroids proved to be normal Biopsy of the left humerus and of the right humerus only showed the presence of osteitis fibrosa Not satisfied with these findings, we performed a biopsy of the left greater trochanter which again revealed the presence of osteitis fibrosa in which many islands of xanthoma cells filled with cholesterol esters were found

The biopsy reports, as published, read as follows

1 Right humerus Microscopically the cystlike area consisted of cellular connective tissue Many bone trabeculae were present, often surrounded by a zone of osteoid tissue In addition, there were bone trabeculae around which many osteoclasts were situated The pieces of bone cortex showed fibrous bone marrow, and the cellular fibrous tissue mentioned above was found at the inner side of these cortex fragments No lipoid-containing cells were present

2 Head of the femur A large number of tissue fragments varying in size from 1/2 cm. to 3 by 2 1/2 by 3 cm. were obtained, consisting of white somewhat glassy, firm tissue Many of these tissue pieces showed brown spots. Several irregular yellow spots to a size of 1/2 cm were also seen A few small pieces of bone were present Microscopically, the main part of the tissue consisted of fibrous connective tissue which in general was poor in nuclei A few remnants of bone tissue were found, occasionally surrounded by an osteoid zone

The yellow areas mentioned above appeared to consist of islands of typical xanthoma cells In the specimen, stained with sudan, these cells contained needle-like crystals which were bi-refractile and stained pale yellow Heating of the unstained specimen resulted in the formation of bi refractile drops

On the basis of these data the diagnosis of xanthomatosis of the bone was made

The pigmentation of the mucous membrane of lips and mouth and the findings of a slight hypotension led to the determination of the sodium content of the serum. As this was repeatedly found to be normal, the presence of Addison's disease could be excluded Treatment with cortical extract did not influence the condition

We thus defined a syndrome consisting of multiple cystlike areas of bone, normal structure of the skeleton in so far as it was not involved in this cystlike degeneration, osteitis fibrosa in which large nests of xanthoma cells could be found, absence of the biochemical syndrome of hyperparathyroidism, and absence of a parathyroid adenoma [9]

The separation of this syndrome was important in order to prevent unnecessary operations on the parathyroids At the time we were much impressed by the presence of islands of xanthoma cells As mentioned above, we even performed three biopsies on our second patient in order to find these islands In this respect we followed the example of Kienboeck who had insisted that cystlike areas of the skeleton may represent xanthomas or lipoid granulomas Thus, we carefully studied these cases for the presence of other signs of lipoid granuloma which, by the way, we could not reveal Nevertheless, we designated this new entity of skeletal disease as lipoid granulomatosis of the bones without signs of Hand-Schüller Christian disease

In 1937 Albright described several instances of this syndrome [10 11] He named this disease osteitis fibrosa with pigmentation (as present in both of our patients) and precocious puberty (as present in our female patient) In 1938, Lichtenstein, later Lichtenstein and Jaffe, stressed the fact that the bone lesion is the outstanding lesion of this syndrome [12] They make it clear that only one in every twenty to thirty cases that show these cystlike lesions of the skeleton also present pigmentations with irregular edges and precocious puberty They also insisted that the term osteitis fibrosa was unfortunate because osteitis fibrosa is too general a designation and rebaptized the disease as polyostotic fibrous dysplasia The latter name has become popular, although many clinicians use the name Albright's disease Monostotic fibrous dysplasia also occurs frequently In the course of years it has been brought out that in cases with multiple bone involvement the lesions are sometimes limited to one side of the body In our material this characteristic of the disease has occurred less frequently than has been emphasized Sexual precocity is relatively frequent in the female patients but has also been observed in a few instances in boys

In 1938, we described sarcoma development in an area of fibrous dysplasia as was later observed by Coley and Stewart and also by Jaffe [13] In

It may well be that this disease should be differentiated from lipoid granulomatosis of the bones. At the time it was more important to define the characteristics of the disease which permitted differentiation of this clinical entity from Recklinghausen's disease In addition, we have always insisted that some of the cases diagnosed as polyostotic fibrous dysplasia, even those presenting marked hyperostosis, may represent burnt-out cases of lipoid granulomatosis of the bone. One case illustrating this possibility is reported here.

CONTAMINATION OF FOOD PUBLIC HEALTH HAZARD

Poisons that remain in foods after preparation for the table are a hazard to public health, warns James R. Wilson, M.D., Chicago, secretary of the Council on Foods and Nutrition of the American Medical Association.

Dr Wilson points out the need for protection against such contamination of food in an article on pesticides which appears in the January issue of *Hygeia*.

The pesticides, or poisons, to which Dr Wilson refers are relatively new products introduced during and after World War II. Pesticides include insecticides, such as DDT, used to combat insects that damage crops, fungicides, used to combat plant diseases, herbicides, or weed killers, and rodenticides, used in the control of rats and mice

Fresh fruits and vegetables are considered dangerous because there is little protection to the consumer at this time against contamination of them with pesticides. Manufacturers of infant foods are refusing to accept from growers fruits and vegetables which contain DDT or other residues which cannot be removed in processing Canners have developed satisfactory methods for removal of the residue from certain fruits however

Steers fed on food contamined with DDT store the material in their body fat, and cows not only store it but also excrete DDT in their milk. Dr Wilson says that this matter is being studied

BHC—benzene hexachloride, one of the newer insect killers—and parathion, another new insecticide, apparently penetrate the surface of plants and are incorporated in the tissue. These penetrating poisons cannot be entirely removed by washing or peeling, the article indicates.

The Council on Foods and Nutrition has warned against indiscriminate use of these pesticides and has urged that measures be taken immediately to insure adequate protection for consumers "Disastrous consequences seem a certainty unless the use of the new pesticides is surrounded by better safeguards than now exist," Dr Wilson says "Concerning their toxicity to man, there is a shocking lack of factual data having to do with the effect of these substances when incorporated in foods and eaten. Little of practical value is known of how human beings withstand small amounts over long periods of time Adequate toxicity studies are essential for the establishment of safe methods for the use of these poisons"

showed the presence of approximately twelve small, discrete, soft, dark brown elevations over arms, back, and abdomen These were not café-au-lait spots but probably small moles The left leg was about 1 cm. shorter than the right

Laboratory examination showed that the urine and the total blood count were normal. Blood urea nitrogen was 13 mg per cent, fasting blood sugar, 65 mg , serum calcium, 11 5 mg , phosphorus, 3 0 mg , alkaline phosphatase, five King-Armstrong units The cholesterol was moderately increased, total cholesterol was reported as 380 mg , 420 mg , and 480 mg , cholesterol esters, 225 mg and 235 mg Renal function, as demonstrated by the concentration and phenolsulfonthalein tests, was normal. The basal metabolic rate was plus 1 per cent On a calcium-poor Bauer-Aub diet, the urinary calcium excretion was moderately increased, 657 mg in 2,250 cc of urine in the course of three days

The roentgenologic report read as follows

> Examination of the skull, long bones, feet, lumbar vertebrae, and pelvis shows considerable mottling of the bones of the calvarium which appears to be due to irregular areas of increased and decreased density The outlines of the sella turcica are normal There is a large ovoid cystic area in the proximal phalanx of the left fourth finger, causing local expansion of the bones and bulging of the lateral cortex. The other bones of the hand do not appear abnormal No abnormality in the bones of the forearm and arm or bones of the feet is to be seen, nor any distinct abnormalities in the lumbar vertebrae or the innominate bones There is a deformity of the left femur in its mid-third, due to an old healed fracture, and a small area of rarefaction in the outer cortex at the upper end of the right femur A transverse line of decreased density in this area suggests an infarction of the cortex. The cortex at the outer aspect of each tibia in its middle third is considerably thickened In the mandible, a considerable irregular area of rarefaction in the anterior portion of the left side is present The changes do not appear to indicate the presence of hyperparathyroidism but of a polyostotic fibrous dysplasia

A biopsy of the skull showed that the marrow spaces were filled with fibroblasts and a network of fine, connective tissue fibrils Numerous plasma cells, lymphocytes, and histiocytes were found in this fibrous tissue A biopsy of the cystic lesion of the left fourth finger showed the presence of a lipoid granuloma.

The presence of cystlike changes and hyperostosis in different areas of the skeleton, especially in the skull and around the cystlike phalangeal lesions combined with the normal calcium, phosphorus, and phosphatase levels in the serum, actually seemed to favor the diagnosis of fibrous dysplasia In view of these roentgenologic signs, the moderate hypercholesterolemia was disregarded The biopsy of the phalangeal lesion revealed the presence of lipoid granulomatosis The lesion of the skull was probably older, which would account for the extensive osteitis fibrosa found there True, the skull lesion did not show the whorls of coarse and thick fibrous tissue characteristic of fibrous dysplasia of the bone However, the lesion was evidently old enough to have resulted in areas of hyperostosis of the skull

It may be questionable whether the islands of xanthoma cells which occur in Albright's disease or polyostotic fibrous dysplasia justify the diagnosis of lipoid granuloma. However, it follows from this case that lipoid granulomatosis of the bones may terminate as fibrous osteitis with hyperostosis and that competent radiologists may diagnose it as polyostotic fibrous dysplasia.

Summary

As early as 1932 and 1934, we described two examples of a disease characterized by the presence of multiple cystlike changes of the skeleton which until this time had always been diagnosed as Recklinghausen's disease of the bones One of the patients was a girl in whom menarche had started at the age of seven, both patients showed hyperpigmentation and osteitis fibrosa At the same time we stressed the presence of osteitis fibrosa with islands of xanthoma cells in both patients In view of the latter finding we assumed that the diagnosis of lipoid granuloma of the bones was in order The occurrence of accumulations of xanthoma cells in the fibrous bone marrow has been confirmed repeatedly

We differentiated the syndrome which these two patients exhibited from Recklinghausen's disease because the characteristic biochemical features of the latter disease were absent and because the cortex of the bones was normal except in the areas where the cystlike areas had developed We carefully described the histology of the disease

In 1937, Albright described seven cases of this syndrome as osteitis fibrosa with pigmentation and precocious puberty In his opinion this disease is a separate entity and is not connected with lipoid granuloma of the bone In 1939, Lichtenstein and Jaffe concurred with this opinion, described the histology of the disease in detail and designated it as polyostotic fibrous dysplasia The cystlike lesions represent areas where cancellous bone and bone marrow have been replaced by firm fibrous tissue, arranged in interlacing bundles and whorls In this fibrous tissue, a considerable number of minute spicules of immature bone, and sometimes islands of cartilaginous tissue, are found In older lesions, sclerosis of the bones develops Cutaneous pigmentation is found in a considerable number of these cases, and in the female patients premature sexual development is commonly present

Both authors insist that pigmentation, precocious puberty, and hyperostotic lesions favor the diagnosis of fibrous dysplasia of the bones and exclude the presence of lipoid granulomatosis

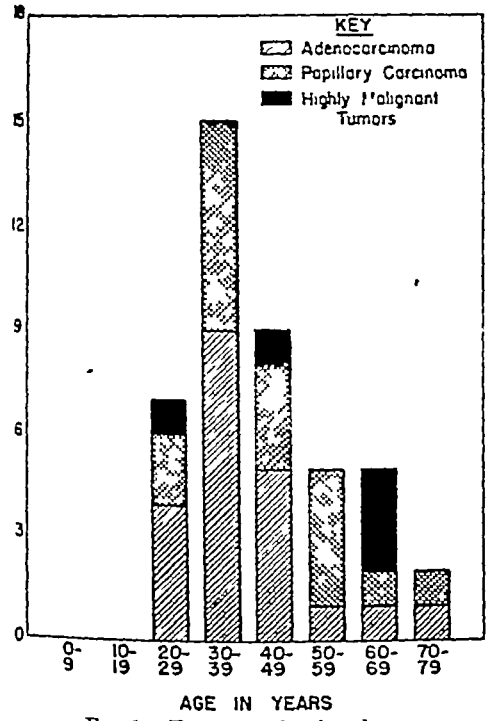

FIG 1 Frequency by decades

agnosed clinically in all the others except one, and in that case the malignant character of the growth was recognized at operation. The percentage of cases with sufficient evidence to suggest a clinical diagnosis of cancer is the same as the average reported in the literature.[4,10,11]

In 41 of these cases follow-up information is available through personal observation or a statement from the family physician Two patients are known to have local persistence of their disease Two patients had recurrence of the disease with excision of the recurrence one year and five years after the original operative procedure Both are still alive, one patient eight years and the other thirteen years after the first operation Two instances of lateral aberrant thyroid tumors are included, one of which had the primary tumor excised while the other did not The latter patient had been operated on before coming to our hospital when a nodule in the cervical lymph node chain was removed In our hospital another surgeon removed a second tumor but did not do a homolateral thyroidectomy in spite of a palpable nodule in that lobe A third nodule has since been removed from this patient in another city This case supports the belief that all lateral aberrant tumors represent metastases from a primary lesion in the homolateral lobe of the thyroid gland

Of 25 patients who were operated on more than five years ago, five are known to be dead Four were followed for only one to two years The remaining 16 cases are alive and well six to seventeen years postoperatively Eighteen patients were operated on during the years 1943 to 1947, inclusive. Of these, three are dead because of their disease, and two are living with persistence of the cancer

In any study of this type it is essential that the factors used to establish a diagnosis be clearly set forth The criteria used in this review were those emphasized by Graham as significant in the separation of early malignant from benign thyroid tumors.[12] Invasion of the tumor capsule, extension into surrounding normal tissues, penetration through the endothelium of blood vessels, or a combination of these features was found in each of the cases diagnosed as malignant (Fig 2) A large group of cases was found in which acini, parts of acini, or groups of tumor cells were present in several blood vessels and in more than one section (Fig 3) The significance of this finding is not clear Are these isolated acini or cell groups in vascular lumens to be accepted as evidence of blood vessel invasion? In general, we believe they are not However, multiple sections in one such neoplasm did reveal a point where cells from the tumor itself were actually penetrating the endothelium and extending into the vessel lumen, indicating that the isolated cell groups present in the vascular lumens at a distance from the point of penetration did originate in the tumor Many tumors that showed this finding were hyperplastic adenomas, and a study is now under way to determine whether or not Loeb's finding that regenerating thyroid tissue can invade blood vessels applies to hyperplastic thyroid epithelium [13] At the present time, however, we cannot accept the finding of isolated acini or tumor cells in blood vessels as valid evidence of malignant change, since such acini may represent artefacts produced during manipulation of the tissue

FIG 2 Capsule invasion.

THE RELATION OF SINGLE NODULES TO CANCER OF THE THYROID GLAND

JOHN C McCLINTOCK, M D , and JOHN J FARRELL, M D , Albany, New York

(From the Departments of Surgery and Pathology, Albany Medical College and Albany Hospital)

THE frequency of malignant disease of the thyroid gland has been indicated in relation to many different factors Watson and Pool stated that thyroid cancer comprised 0 43 per cent of the general admissions to Memorial Hospital, New York.[1] Smith, Pool, and Olcott give the frequency as 2 5 per cent of all thyroid specimens, and Cattell reported 2 3 per cent malignant in relation to all thyroid operations [2 3] Many authors compare the frequency of cancer to nodular goiters and their reported figures are as follows Pemberton 4 9 per cent, Cole, Slaughter, and Rossiter 7 2 per cent, and Hinton and Lord 7 6 per cent [4–6] In Boston, Vanderlaan could find only five cases of malignant thyroid disease in 18,669 autopsy protocols, but Schlesinger, Gargill, and Saxe in the same city studied 1,373 necropsies to find 112 nodular thyroid glands of which 4 5 per cent were malignant [7 8] This confusion concerning the actual incidence of malignancy must certainly create an attitude of indifference on the part of those doctors whose contact with thyroid cancer is infrequent

During the past few years increasing attention has been paid to single nodules in the thyroid gland as a source of malignant disease This comparison has the advantage of more forcibly impressing physician and surgeon with the importance of nodular goiter, because Cole *et al* reported that cancer was found in 24 per cent of 92 cases of nontoxic single thyroid nodules, and Ward found malignancy in 14 of 100 patients with solitary thyroid tumors [9] Because of this trend it was decided to limit this study to the frequency of cancer in single thyroid tumors Our results follow the pattern of the published statistics, and they re-emphasize the often repeated and often neglected admonition to remove nodular goiters

From the office records of over three thousand patients with nodular goiter operated on from 1930 to 1947, inclusive, 1,684 cases were selected because the examiner noted a single tumor The hospital charts on this latter group were reviewed, and any suggestion of multiplicity of nodules in either the operative finding or gross pathologic description disqualified the case for this study Three hundred eighty-two cases were finally selected as acceptable for the investigation, and the original microscopic slides on all of this number were studied histologically Thirty-two patients in this group had been given an original diagnosis of cancer, and in three more the pathologist was suspicious of malignant disease. The remaining 347 cases were all diagnosed as benign on the original pathologic examination

In their initial review of the histologic preparations the authors eliminated those cases that were clearly benign. Any variation in architecture was an indication to prepare additional microscopic sections from the original tissue blocks. One hundred forty-three cases were restudied after preparation of new slides, and, of these, 69 were retained for further examination. These 69 single tumors still regarded as "possibly malignant" were then reviewed, and finally, the sections on 25 remaining cases still suspected of malignancy were examined *

Among the 347 cases originally diagnosed as benign, ten cases were found with sufficient histologic evidence to call them malignant Histologic evidence of malignancy was present in several additional cases that had to be excluded because, in spite of the fact that only one tumor was found grossly, multiple tumors were found on microscopic examination Two of the three cases termed "suspicious" on the original pathologic report are still regarded with suspicion and are not included in the malignant group One of them, however, is now considered definitely to be cancer and is included In our entire series of 382 cases of single thyroid tumors then, 43 are considered malignant, an incidence of 11 25 per cent Analysis of the types of tumor found revealed 17 cases that were papillary in their architecture, 21 that were adenocarcinomas, and five which were highly malignant lesions The relative frequency of these tumor types by decades is indicated in Fig 1

In only two of the 43 patients was there evidence of thyrotoxicosis A clinical diagnosis of benign tumor was made in 26 of the 43 cases now considered to be malignant This fact adds emphasis to the belief that single tumors of the thyroid are more dangerous than is generally accepted Malignant disease was suspected or di

SYMPATHECTOMIES

FREDERICK S WETHERELL, M D , Syracuse, New York

(From the St. Joseph's and Syracuse Memorial Hospitals)

IT WOULD be a pleasant exercise at this time to discuss thoroughly the anatomy and physiology of the sympathetic division of the autonomic nervous system, for it is better knowledge of these subjects which has increased the indications for surgical and chemical attacks on the system However, since this is written mainly to stimulate an interest in the clinical effects following ablation of sympathetic nerve impulses, only the high points of those subjects will be recalled

When a sufficient number of good therapeutic results are reported or have appeared in my personal experience, an epitomized case history or subject-summary will be presented In each category of indications there may be less than good results or failures, but if even in a few cases there is sufficient evidence of value, it is fair to consider further trials Of great significance when poor results or failures are reported are the questions of completeness of operation, correct application of blocking needles, or proper diagnosis or selection of cases in the beginning The beneficial results of the therapy under discussion would have more universal application if we kept in mind the physiologic actions of the system and recognized the results of overstimulation

Results of Stimulation

Objective—A man, paralyzed by fright, exemplifies the activities of the system for easy remembrance His hair "stands on end," his pupils dilate, his mouth is dry, sweat pours from him, his hands and feet are cold, he trembles, his heart pounds, and his blood pressure goes up For the time, he is incapable of activities which make life worth while He is a completely adrenergic individual Sympathetic nerve end organs and adrenal glands are pouring their activators into his blood The kidneys add renin and the hypophysis pituitrin, the whole process starting in the frontal lobes of his brain

In a lesser degree which we might picture as a chronic, mild fright-state, man exhibits similar signs Subtract worry from the mind of the man with a hypersensitive sympathetic nervous system, and you will have little need for sympathetic nerve surgery Prolonged stress of this sort or recurrent attacks of overactivity of the system are, so far as we know, the basic causes of many of the disease entities we are considering Blood vessels contract, as in vasospastic diseases of which Raynaud's, and perhaps early Buerger's, are extreme examples Into this category also fall the vascular spasms accompanying postinfantile paralysis, extremity traumata followed by causalgia Sudeck's disease, thrombophlebitis, and the vasospastic phenomena following frostbite, sprained ankles, sprained shoulders, and the like

Sweat gland hyperactivity is seen clinically in cases of profuse sweating (hyperhidrosis) which at times becomes almost completely disabling Constantly wet hands and feet often make the sufferer a social and occupational outcast Severe obstipation may result from hypertonic activity of the smooth muscle sphincters of the rectum

Subjective—Pain impulses are carried in sympathetic nerve trunks by means of pain fibers similar to those found in the somatic nervous system. Pain is initiated by contraction or distention of viscera and blood vessels beyond physiologic limits Examples are primary dysmenorrhea, pain of aortic aneurysm, angina pectoris, painful herpes, intractable pain of the gastrointestinal tract and the pancreatic and biliary tracts [1-3]

It is in the latter category that most recent advances have been made This is true also of cervical sympathetic block, surgery for relief of vasospastic types of headache, and, most recently, intractable asthma [4,5]

Testing

The simplicity of paravertebral procaine block procedures as a means of testing the results of ablation of sympathetic nerve impulses should shorten the period of disability of many patients Too often there is long delay while various physical therapy, medical, and orthopedic procedures are tried It is well known that the trigger reflex action, which results in vasospastic phenomena and pain, may be stopped by a ganglion block.

A general block may be obtained by the use of tetra-ethyl-ammonium chloride This substance is being used to aid in determining the

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Surgery May 21 1948.

FIG 3 Tumor acini in blood vessel Not acceptable as blood vessel invasion

Our series is too small to be statistically significant as to the relative frequency of the various types of malignant disease of the thyroid gland The variations in architecture are, however, associated with well recognized characteristics of growth and metastasis that result in slight modification of the surgical treatment for each form Thus, papillary tumors account for about 30 per cent of all thyroid malignancies [4] They may recur or metastasize as long as twenty years after the original diagnosis [14] The survival rates reported are as high as 80 per cent alive after five years [15] Complete hemithyroidectomy and removal of the lymphoid tissue when involved is sufficient surgery in the usual case to eliminate the disease [16] Total thyroidectomy should be done when the lesion is near the midline Willis says, "Papillary adenomas cannot be distinguished from papillary carcinoma "[17] The prognosis must always be guarded.

The large group of adenocarcinomas is notorious for its invasion of blood vessels, and this fact may easily result in the early appearance of metastases from a tiny nodule The prognosis in most of these cases is five-year survival in 70 per cent, but the histologic finding of solid foci of anaplastic cells is an ominous sign that reduces the five-year survival to about 30 per cent of the cases [3] The tendency to blood vessel invasion requires radical excision of overlying muscles and all veins, including the internal jugular

Highly malignant tumors are usually rapidly fatal regardless of the therapy Extensive surgical removal of the growth combined with deep x-ray treatments has, according to Cattell, improved the five-year survival rate [3] Unfortunately, most of these tumors, except reticulum cell sarcoma, are radioresistant. Only one patient in this series of highly malignant types is living with persistence of an epidermoid carcinoma first diagnosed two years ago

The histologic recognition of early cancer in the thyroid gland is extremely difficult, especially in tumors presenting the first two types of architectural change Pathologists who have studied many thousands of thyroid specimens do not always agree on the benign or malignant nature of a given tumor Even in our small series the three pathologists have expressed different opinions regarding the benign or malignant nature of a few tumors A majority opinion has prevailed in the final interpretation, but wherever possible, a benign diagnosis has been accepted

We hope that this study will stimulate critical thought devoted to the development of minimum standards for interpreting existing criteria. The development of new and more consistently reliable aids in the separation of benign from malignant thyroid lesions is certainly a field for future investigation Our review emphasizes the fact that greater experience in the diagnosis of thyroid tumors results in an increase in the number of accurate diagnoses An important part of this experience is the knowledge that study of many sections, preferably serial sections, of a suspicious neoplasm is absolutely essential if a correct histologic interpretation is to be obtained The pathologist, therefore, has an extremely important role in the management of the thyroid cancer case because both the treatment and the prognosis are influenced by the type of tumor removed

Summary

1 This retrospective study of 382 single thyroid tumors revealed 43 cases of malignant disease, ten not previously recognized

2 Minimum standards for interpreting the existing criteria by which early malignant lesions are separated from benign thyroid tumors must be more widely established because of the influence the histologic diagnosis has on the treatment and prognosis

3 Malignant change occurs in a much higher percentage of single thyroid tumors than has heretofore been generally accepted

the same. But it didn't break out in ulcers I wish now I had let you operate on that one too."

This story is typical after sympathectomy in one of these cases. It seems unfortunate that the opportunity for relief by sympathectomy in this group of cases is not more widely recognized.

Buerger's Disease.—W. L. M. presented himself with a typical picture of bilateral thrombo-angiitis obliterans. There was an ulcer at the base of the right third toenail, his feet were red and cold. He had been unable to do his work as a plumber for six months because of intermittent claudication, which limited his walking ability to half a city block, and the coldness of his feet which was at times almost unbearable. The acute symptoms were apparently precipitated by an attack of virus pneumonitis in April, 1946. A bilateral lumbar sympathectomy in two stages was performed in October, 1946. Both feet and legs became dry, warm, and comfortable.

He reported for observation on March 30, 1948, and has been working steadily for one year without a lost day. His legs and feet are dry and warm. There have been no ulcers. If he walks too fast, his calves begin to cramp after a block and a half. Going slowly, he has no trouble. He does not use tobacco.

This is a fairly typical story of Buerger's disease treated by sympathectomy. These patients must continue on a careful regimen and must not overload a circulation which, while no doubt better than it was before operation, is still encumbered by diseased vessels. Much depends upon the sympathectomy-established collateral circulation. It would seem that early operation in Buerger's disease should be an almost routine procedure. It would save the patient much expense and many time-consuming medical measures, to say nothing of reaching the point where sympathectomy would be useless and have to be replaced by amputation.

Indolent Varicose Ulcers.—Mrs. J. C., age forty-one, seen in December, 1946, had had varicose ulcers of her right leg for thirteen years and of the left leg for four years. She had had every known treatment, including venous ligations and repeated skin grafts which were not successful. Following a bilateral, two-stage, lumbar sympathectomy in December, 1946, the ulcers on both legs healed under ordinary treatment of cleanliness and epithelium-stimulating applications.

This also is a rather extreme example. Earlier recourse to sympathectomy would have saved this woman much disability and misery. Improved circulation and a warm, dry envelope of skin, under which all cell metabolism is improved, are the bases of beneficial results.

Amputations.—Preamputation sympathectomy has aided materially in healing stumps of extremities and, in some cases, has allowed lower amputations, even when it seemed useless to subject the patient to the procedure in arteriosclerotic disease. There are some contraindications to sympathectomy in obliterative arterial disease where it might be hoped that the extremity could be saved by sympathectomy.

Relief of Pain—Dysmenorrhea.—Miss M. W., age eighteen, suffered from severe primary dysmenorrhea, periodically disabling for one day. No relief was gained from medical measures except opium derivatives. Without the patient's knowledge (but with the parent's consent), a resection of the superior hypogastric plexus ("presacral nerve") was done, incidental to an exploratory celiotomy for generalized, right-sided abdominal pain. A defect in the mesentery had allowed the jejunum and upper ileum to slip through and lie in the right side of the abdominal cavity. Three weeks after the operation, the patient, in school in New England, delightedly telephoned her mother, vacationing in Florida, that she had had a period and did not even know it had started. This freedom from cramps continued. She was married seven months later, and ten months later while at home, she experienced a slight abdominal crampy feeling, which she attributed to being preliminary to a bowel movement. Two hours later, after a drive of twenty miles to the hospital, her baby was born. She just made it.

It has been said that most cases of dysmenorrhea are of a psychologic nature, that operations, when effective, were on that basis. This case, even though it is but one, should help to explode that theory. It is to be further noted that obstetricians have reported similar experiences, nearly painless deliveries, in patients who have been delivered following resection of the superior hypogastric plexus.

This is an operation which requires most meticulous resection of all fibers leading to the plexus, otherwise pain impulses, even though remaining fibers are few and small, may still be transmitted and the operation, rather than the operator, blamed.

Abdominal Visceral Pain (Unexplained).—Resection of superior mesenteric plexuses and celiac ganglia has resulted in relief of unex-

drop in blood pressure which may be expected following sympathectomy and for relief in certain painful conditions, of which herpes zoster is an example While it has been used in attempts to determine the value of proposed sympathectomy in peripheral vascular diseases, its value in this respect or as a therapeutic measure is doubtful

Examples of Use

Necessarily epitomized, the following examples are offered as being typical of what may be expected They are given in this manner in lieu of a detailed discussion which would require a separate paper for each entity and defeat the purpose of this presentation

Extremity Pain Followed by Disability—Mrs F I first noticed pain in her right shoulder when she was ironing The pain increased daily until any movement of the arm or hand was impossible The fingers became blue and cold and moist Finger movement caused pain She was admitted to a hospital on July 17, 1942, three weeks after the onset of symptoms At that time, her shoulder, elbow, and fingers were stiff Heat treatments and massage were given After two weeks without benefit, the orthopedic service was called in Her arm was placed in overhead traction for two weeks Then, under intravenous anesthesia, the shoulder, elbow, and fingers were manipulated twice a week for about two months There was no betterment The prospect of complete ankylosis of the entire right upper extremity was imminent

However, after the first stellate ganglion and upper thoracic block with 15 cc of 1 per cent procaine solution, the patient's hand became warm and painless She was able to attempt movements Two more blocks were given at intervals of a few days The improvement was progressive The patient cooperated willingly, manipulating her fingers with her left hand and raising her arm of her own volition There was no pain In a few months she was crocheting

There has been no recurrence, and at the present time all motions are normal She is working as a practical nurse

This is an extreme example, but it gives the lead to early treatment of similar disorders of lesser degree but of equally painful beginnings The vasospastic nature of the picture, with lack of nutriment to the involved parts, is indicated in the case of Mrs F I by the fact that she found it unnecessary to cut her fingernails during the entire period preceding the procaine blocks There was no osteoporosis

The osteoporosis of post-traumatic painful osteoporosis (Sudeck's disease) is, no doubt, of similar nature, i e , based on vasospasm and lack of proper nutriment to the involved bones The results of block in these cases are similar Extremity pain after trauma (often forgotten by the patient) should have early trial block of the regional sympathetic nerve ganglia as the treatment of choice

Thrombophlebitis.—Mrs D D was admitted to the hospital with a left leg thrombophlebitis On the night of admission her temperature rose to 105 F , and the patient was delirious When seen the next morning, the leg looked like a well-boiled sausage—as if steam would escape if it were pricked with a pin Tenderness was extreme A needle was inserted at the level of the first left lumbar ganglion, 15 cc of 1 per cent procaine solution was injected With a properly placed needle this amount of solution spreads to neighboring ganglia It is not necessary to use several needles At the end of twenty-four hours the leg was half its former size and painless to pressure The temperature was normal In three days the leg was normal in size The patient left the hospital seven days after admission.

Typical Raynaud's—E J , manager of a shoe store, noticed an increasing inability to fit shoes because he could not flex his fingers. Examination revealed Raynaud's syndrome with scleroderma of the dorsum of both hands A cervical sympathectomy resulted in gradually increasing flexibility of the skin which allowed him to approximate thumb and fingers and finally resulted in complete rehabilitation However, he should have had the benefit of the operation long before the onset of scleroderma

Infantile Paralysis—Miss G E , age thirty-six, had had anterior poliomyelitis at the age of six Both lower extremities were affected The right leg became unbearably cold during winter months with ulcerations the past two winters The left leg was cold but not so severely Right lumbar ganglionectomy and trunk resection were done at age thirty-six, in September, 1944 During her stay in the hospital, the patient repeatedly remarked that the leg was warm and comfortable for the first time within her memory In June of the next year, she reported that the leg no longer became swollen as it formerly did on hot days Her subjective symptoms are explained in a letter dated March, 1946 "My leg kept warm all winter, but my other leg was cold about all the time I wore wool underclothes and was in a furnace-heated house, but the leg was cold just

sympathetic nerve impulses in certain diseases are added The purpose of the paper is a general stimulation of thought on therapeutic measures which are, as yet, not sufficiently recognized by the general medical profession

GASTROINTESTINAL ANOMALIES

C Douglas Sawyer, M D , Brooklyn, New York

(From the Methodist Hospital)

THE newborn, full-term infant is an excellent surgical risk and will readily withstand operative procedures for the correction of congenital anomalies of the gastrointestinal tract Recent advances in maintaining physiologic balance, in surgical technic, and in the use of antibiotics now make it possible to perform difficult surgical procedures on newborn infants The general surgeon has a very definite obligation to acquaint himself with these newer methods General hospitals are now equipped to prepare these infants for surgery, to provide the necessary equipment for anesthesia and operation, and to care for them postoperatively The pediatrician or general practitioner must be convinced of the need for early diagnosis in infants presenting these congenital defects Developing a philosophy of treatment of these gastrointestinal deformities in the presence of other defects is most important It is a common belief among pediatricians that operations upon babies with multiple congenital anomalies is a waste of time Over 25 per cent of the infants with congenital anomalies of the gastrointestinal tract will show another congenital anomaly If the defect is amenable to surgery, there is no reason why it should not be attacked

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Surgery May 20 1948.

The Pediatric Service at the Methodist Hospital makes the diagnosis of congenital anomalies of the gastrointestinal tract within forty-eight hours Vomiting is considered the most important symptom, even though it occurs in most newborns How is one to determine whether or not he is dealing with an intestinal obstruction? The vomiting which becomes more frequent and intense with successive feedings is not normal Immediate regurgitation suggests atresia of the esophagus Bile-stained vomitus with milk curds suggests a high atresia, beyond the ampulla of Vater Malodorous and fecal vomitus suggests low atresia

The most outstanding aid to diagnosis is the roentgenogram. The use of barium in the diagnosis of any intestinal obstruction in the newborn is to be decried Not only does the barium regurgitate into the tracheal tree and cause bronchopneumonia, but it prevents the proper handling of the bowel at the time of operation. There is never any need to use barium for visualization in a newborn infant If contrast medium is indicated, a dilute solution of lipiodol will suffice.

With these few general remarks, I wish to discuss in detail the more recent developments in management of congenital atresia of the esophagus, congenital diaphragmatic hernia, atresia or stenosis of the small intestine or colon, reduplications of the gastrointestinal tract, rotational

plained abdominal pain after all other methods, including psychiatric checkup, have failed Indications for exploratory operation should be present The patient should have the benefit of the sympathetic pain-ablating operation when no anatomic or pathologic condition which might cause the distress is found [8]

Causalgia.—Shumacker *et al* report a series of 34 upper and 23 lower extremity causalgias treated by sympathectomy [9] This report emphasizes what has been noted by many others, namely, that, while procaine block alone may give permanent relief, there are some cases which, because of decreasing effect of repeated blocks, need a sympathectomy These authors make the following statement

> In all of medical practice no results are more sudden or spectacular Before the injection, the patient would be in agonizing pain, guarding his injured extremity with zealous care, reluctant to have it examined even after painstaking assurance that every effort would be taken to perform the examination in the gentlest manner, hesitant to have the block itself carried out because he felt his capacity to suffer prevented him enduring any more discomfort, even the prick of a needle which he had often heard from other sufferers might lead the way to cure As soon as the injection was completed, his careworn face would assume an expression of extreme satisfaction, the beads of perspiration would disappear, and he would settle back with a sigh of relief to enjoy his respite

It is unfortunate that too often there has been delay in diagnosis, which has, in turn, caused unnecessary suffering, and, too, that the use of physical therapy methods and drugs have been resorted to because of the lack of recognition that ablation of sympathetic nerve impulses is required

Injuries (Sprains) —The classic example of relieving vessel spasm by blocking impulses at the site of a purposely applied irritating substance is often forgotten in cases of sprained ligaments Sprains are accompanied by the pain and edema of vasospasm When a local procaine block is produced at the point of greatest tenderness, the relief of pain allows use of the part, and there is a surprising subsidence of the edema Occasionally, a second or even third block may be necessary at twenty-four-hour intervals No time should be lost in applying this method of eliminating the trigger mechanism

Hypertension.—Best known today is the operation of thoraco-abdominal sympathectomy for essential hypertension Indications for operation are being clarified There is, however, still a lack of unanimity regarding the extent of the thoracic and lumbar portions of the procedure Some surgeons advocate a complete resection of the thoracic ganglionic chain, including the splanchnic nerves, while others favor a more modified technic My own experience has included all suggested approaches from that of Adson, through the Peet, Smithwick, and Hinton technics [10–13] The end results, from the standpoint of symptomatic relief, have been closely similar This is also true of the blood pressure manometric results

Evidence is collecting that widespread resection is not only unnecessary but adds materially to the dangers of the immediate postoperative period and to the sometimes severe postural difficulties of the patient months after the operation And all this is without the added material benefit in the long-term end result

There is further evidence that the blood vessel dilation, which may have led surgeons to extend their attacks to include the entire thoracic chain in some instances, is not the chief reason for relief of symptoms The effect on the humoral factor is receiving more attention [14] A simple life without the urge and mental stress of modern living, as found with the African negro and the agricultural Chinese, does not lead to essential hypertensive disease Set these easygoing brains to worrying by transplanting them to high-speed living and property worries, and, depending on inherent genetic influences of the individual, we begin to see functional results which lead to the formulation of postulates pointing to a humoral factor

Sympathectomy of the adrenals, decreasing the hormonal influence, could be the mechanism which lessens the production of the hormones concerned in the pathogenesis of essential hypertension

Now that end results are pretty well established, it would be well for surgeons to consider backtracking to a point which assures adrenal denervation with a minimum of surgical assault

Apoplexy —The recently proposed stellate ganglion block in cases of cerebral accidents, excluding hemorrhage, will require careful study by internists especially interested in the subject The procedure itself is a simple one, but surgeons are not in a position to evaluate the indications [14]

Summary

A series of brief case reports is presented Epitomized reviews of newer concepts of the advantages of various methods of ablation of

type of anomaly with which he is dealing Multiple atresias usually occur in the ileum, but the atresias occurring in the duodenum and jejunum are frequently single. If the atresia is low enough in the duodenum to permit a jejunoduodenostomy, this is the operation of choice However, if it is in the first portion of the duodenum, a gastroenterostomy must be done. It is difficult at times to handle the distal undistended bowel, which at first sight might even appear to be atretic. The lumen can be distended with air or mineral oil, so that it is defined. It is necessary to aspirate contents and air from the proximal bowel. The anastamosis is readily accomplished by a single or double layer of nonabsorbable suture in a side to side manner The operator should pay close attention to the corner ends of the anastamosis and by placing a small catheter in these corners, they are more readily identified

Reduplications of Intestine

Reduplications of the bowel in a newborn will present the same picture of intestinal obstruction when they are high in the gastrointestinal tract The reduplication is intimately associated with the normal bowel itself The muscular coat may form some of the muscular coat of the normal bowel, and its blood supply is the same. Reduplications of the esophagus can sometimes be resected However, it is probably far safer to destroy them by an actual caustic after opening into the *reduplicated area Reduplications of* the stomach and duodenum are difficult to handle Some communication between the normal stomach or duodenum and the reduplication should be established or a resection accomplished Reduplications of the ileum are easily handled by resection of the normal bowel and the reduplication.

Rotational Anomalies

It is sometimes confusing for a surgeon to open the abdomen of a newborn and be confronted with a picture that seems impossible to unravel This confused picture immediately suggests that the operator is dealing with some type of rotational anomaly Evisceration of the entire small bowel on the abdominal wall will usually indicate the presence of a volvulus There may be nonrotation or malrotation with odd fixations of the parietal and visceral peritoneum. After the volvulus is reduced, the location of the cecum should be determined It usually lies free or is fastened in the midline by bands which extend across the second portion of the duodenum Freeing of this band across the duodenum is one of the most important points of the operation No attempt should be made to suture the cecum into the right lower quadrant.

Anal and Rectal Atresias

For a long period of time atresias of the rectum have been approached surgically When one sees these cases in follow-up, it is obvious that the proper method of treatment has not yet been reached. I do not feel that a concerted effort has been made in every case to determine the location of the distal bowel. It may be in the abdomen. I have seen scarred fibrous tubes without sphincter control that serve as ani Fistulas connecting the bladder, urethra, and, in the female, the uterus or vagina may have been overlooked Fistulas are associated with atretic ani in about 55 per cent of the cases There are several pitfalls to be encountered in the diagnosis of atresia of the anus. A fistula will be present on the external perineal surface and may be assumed to be the normal anal opening Careful inspection will show, however, that such is not the case One must be constantly on the alert for the presence of fistulas running from the rectum to the other organs which empty into the perineal area. I believe that any case which presents an atresia of the anus with a fistula discharging meconium does not present an immediate operative problem These patients decompress themselves and apparently get along for periods of time if the rectum is satisfactorily emptied through the fistula If urinary infection or intestinal obstruction do not develop, these patients are better left alone until they reach an opportune age

The method of x-ray diagnosis as described by Wangensteen and Rice in 1930 has presented the only means we have of knowing exactly where the most distal loop of the rectum lies [1] A metal marker is placed over the anus, the child is suspended by its feet over an x-ray plate, and a roentgenogram taken in that position The column of air will proceed to the furthest point in the rectum, and in that way one can tell how far the rectal bulb is from the anus There is no set rule as to the exact distance, but it is perfectly obvious how needless it would be to explore the perineum if the rectum were out of the pelvis

The anatomic relation of the anus, the rectum, and the pelvis in the infant does not correspond to the adult The sacral concavity is not present, and the rectum is usually straight in the infant In relative sizes, the adult pelvis is much larger than the infant pelvis The perineal approach in a newborn infant is through an area considerably smaller than the corresponding area in the adult, notwithstanding the minute actual area with which the surgeon is presented If he proceeds to grope around in the perineum, after splitting the sphincters, he is definitely bound to interfere with the nerve supply to the sphincter This fact was brought out in a communication by Dr C

anomalies of the small bowel and colon, and congenital atresias of the anus and their accompanying fistulas

Esophageal Atresia

Congenital atresia of the esophagus is brought to mind when an infant immediately regurgitates several feedings This anomaly can be diagnosed quickly by radiography, after inserting a small amount of lipiodol in the upper pouch of the esophagus The presence of air within the abdominal cavity indicates a fistulous connection between the respiratory tract and the distal end of the esophagus This is the most usual type of deformity encountered The operative approach is extrapleural, through the third, fourth, and fifth ribs posteriorly The operator must exercise care in not entering the pleura

The upper end of the atretic esophagus is more readily identified if a small French catheter has been placed in the pouch A silk retention stitch in the pouch will facilitate finding it later on and will also serve as a means of traction The lower end of the esophagus should be freed at its entrance into the trachea and tied off by a silk ligature If it seems improbable that the lower end of the esophagus may not be brought to the upper end, extension of the head and freeing of the lower portion of the esophagus down to the diaphragm may make a juncture of the two portions possible The lower end of the infant esophagus will stand this type of manipulation, although the adult esophagus will not The distal esophagus may be atretic for some distance, rendering anastamosis impossible The approximation of the proximal and distal esophagus should be done without tension and the stoma made as wide as possible The wound is closed after having placed a semirigid tube down to the site of the anastamosis There is an additional collection of fluid around this site, which sometimes impairs the anastomotic juncture It can be aspirated through the tube The question of subsequent gastrostomy as a secondary procedure is left to the operator's judgment Gastrostomy feedings should not be large or under pressure There are no definite reports on the end result of this operative procedure There have been, however, reports of stenoses, some requiring constant dilatation

Diaphragmatic Hernia

Congenital diaphragmatic hernia, although it is not essentially an anomaly of the gastrointestinal tract, is a cause of intestinal obstruction and respiratory embarrassment in the newborn The previous consensus of opinion, particularly among pediatricians, that this disease does not require immediate surgical intervention, is wrong These infants, if they survive to adulthood, have innumerable complaints When they finally come to operation, the procedure is more difficult to do and, sometimes, cannot be done The congenital diaphragmatic hernias usually occur on the left side They may occur on the right, and bowel can be found in the right thoracic cavity The liver does not always plug the defect A roentgenogram will give all the information required

Usually, the first symptoms are difficulty in breathing and rapidly appearing cyanosis, there is also regurgitation of feedings These babies seldom do well after birth and should be operated on immediately The operative procedure is dramatic but not too difficult I believe these cases should have a phrenic nerve crush before operation It immobilizes the diaphragm and permits easier delivery of the abdominal contents from the chest Also, more abdominal space can be obtained at the time of closure The abdominal approach is used A catheter placed in the upper part of the thoracic cavity will equalize the intrathoracic pressure and permit easier removal of the intestinal contents into the abdominal cavity At no time must manipulation be forced If the hernia cannot be reduced, the incision may be extended into the chest through the costal margin, or a separate incision can be made into an intercostal space After the contents are reduced, the closure of the diaphragm permits the re-expansion of the lung under pressure To facilitate closure of the defect in the diaphragm, the intestines should be brought out on the abdominal wall It may be impossible to close the abdominal wall in layers, the cavity being too small to contain the viscera Undermining the skin of the abdominal wall for a distance of 2 or 3 cm around the incision and simply closing it over the abdominal contents will suffice In three or four days, the wall will relax sufficiently to close the wound in layers

Atresia or Stenosis of Intestine

Atresias or stenoses of the duodenum, jejunum, ileum, and large bowel present difficulties in diagnosis Vomiting which persists in a newborn infant usually indicates some type of intestinal obstruction Frequent vomiting will empty the stomach, duodenum, and jejunum, and when the child is seen, there will be no upper abdominal distension The x-ray film may show only a small amount of air present in this part of the bowel Feed the child to see exactly what happens Atresias may be multiple or single In performing any abdominal surgery on these infants, it is best to eviscerate the abdominal contents on a hot lap pad at the time of operation Thus, the operator is able to appraise rapidly the

PLANNING FOR THE CHRONICALLY ILL—A COOPERATIVE TASK

JOSEPH H KINNAMAN, M D ,Garden City, New York
(From the Nassau County Health Department)

UNTIL the star-studded team of community service plans and works together and uses effectively the best available offense and defense, chronic illness will continue to outscore it

Community service has top-flight coaches They include the American Medical Association, the American Public Health Association, the American Hospital Association, and the American Public Welfare Association Only recently, that all-American staff, capitalizing on accumulated experience, prepared a joint statement of recommendations on planning for the care of the chronically ill [1] In that report the social, economic, health, and medical aspects of chronic illness are dealt with as "a complex of interrelated problems which require simultaneous solution"

The players opposing long-term illness include health, welfare, and education departments, legislators, voluntary health agencies, hospitals, medical societies, medical schools, nursing schools and organizations, social agencies, rehabilitation services, and nursing homes They are gaining confidence, as teamwork and plays improve, in their ability to prevent or lessen the scoring opportunities of chronic illness

Medicine today is as much a social as it is a biologic science Increasingly it must organize itself to participate in community efforts in the development of sound, preventive health and medical services for all the people Planning involves an estimate of the medical-social problems of at least the next generation. An essential inclusion is an exploration of the frontiers of knowledge in an effort to solve the mysteries of diseases, particularly those that take the largest toll in disability and death, and to provide sound methods for the diagnosis, treatment, and prevention of physical and mental illness and for the development of a healthy population. The coach, Organized Medicine, recognizes the need for a nation-wide, integrated research program and for that reason supports the principle of a Federal bill which proposes the establishment of a National Science Foundation The longest gains result when several players coordinate their ball handling

Montefiore Hospital in New York City has a complete home-care plan which illustrates the power of team members when they pass the ball effectively to one another to help the patient and his family score against long-term illness Serving the total needs of the advanced cancer case are the hospital, hospital staff physicians and specialists, social service, public health nursing, visiting housekeeper service, employment service (New York State), and voluntary health agency (American Cancer Society) Dr Martin Cherkasky, supervisor of this program, says, in effect, that it proves that advanced cancer patients living at home can receive adequate hospital, medical, and nursing care, at lower cost than otherwise Another gain is especially important—that program frees hospital beds for new patients

Chronic illness piles up a bigger score than it should because community service does not use winning plays often enough and seldom uses them in combination The players agree that the preventive approach offers the greatest hope of defeating chronic illness Coach Organized Medicine recognizes the need for—in fact, recommends—nation-wide coverage with full-time local health units Yet, today, only twelve of the 57 varieties of counties in upstate New York provide their citizenry with the community health protection services which develop under the leadership of a full-time department of health

At every opportunity, authorities, such as Dr Howard A. Rusk, stress the fact that the experiences of both the Veterans Administration and some civilian hospitals show that rehabilitation to the point of self-care, and even to full or limited employment, is possible for many of the chronically ill who have been hospitalized (or given custodial care elsewhere) over long periods Yet, patients in most civilian hospitals receive none or too little such service [2] Rehabilitation and convalescent care aspects of medical-social service and educational responsibility obviously are not entirely medical in character They represent an ideal area of cooperation between medicine, social service, vocational training and guidance, industry, and the public

The employment records of handicapped and older workers during World War II show that they were loyal, reliable, and, when properly placed, as productive as younger persons doing the same work. The viewpoint that older workers can learn to do well jobs which they can get is gaining support The New York State Legislative Committee on Problems of the Aged reminds industry and business that employment is a form of therapy, and that full utilization of older work-

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Public Health, Hygiene, and Sanitation, May 20 1948

Everett Koop of the Children's Hospital in Philadelphia [2] Dr Koop feels that prolonged perineal exploration endangers the nerve and blood supply to the sphincters It is more advisable to operate on those babies with the rectum out of the perineal area by a combined abdominal and perineal approach Babies do not do well with colostomies, and it is far better to do the initial procedure all at one time

Whatever part of the bowel presents, whether the distal end of it be in the region of the transverse colon or the descending colon, it can generally be freed to the point where it can be brought down to the pelvic floor and pulled through the perineum The external sphincter can be located externally by tickling the buttocks on either side The sphincter, usually present, will be seen to contract under the skin. Without making any incisions through the sphincter whatsoever, a hemostat can be pushed through the sphincter into the pelvic opening After the bowel has been freed, by using the hemostatic clamp, it can be pulled down and brought to the outside through the normal external sphincter The bowel is then sutured to the outside skin and opened Mechanical dilatation after many of these procedures is usual This is a definite improvement over previous transperineal attacks that have been unsuccessful, leaving the infant with a colostomy and destroyed sphincters If a fistula is encountered, the rectum must be brought down through the sphincter to a point beyond the fistula and excised

Preoperative Preparation

The preoperative preparation of these babies is not complicated Infants are endowed with a normal physiologic setup which they can maintain for forty-eight hours It is always well to know the plasma and the red cell concentration or dilution This is determined by estimating the total protein level and hematocrit readings In desperately ill babies, these readings help to determine at which period they are in physiologic balance and ready for operation Dr Edward Donovan in 1937 pointed out the need for careful preoperative preparation of babies for pyloromyotomy [3] Previously, that procedure had been considered an emergency I believe that infants that are not brought into the hospital within the first forty-eight hours do much better if they are given a certain period of preparation, even though they are in desperate condition when they arrive They can be made good surgical risks

The intravenous work is done by the pediatric house staff, who find it very easy to shave the scalp and inject one of the small scalp veins by needling In preparing the newborn for any extensive surgical procedure, it is better to insert a cannula into the malleolar vein in either foot The surgeon then has constant access to the infant's venous system during the surgical procedure This also permits the baby to be left in an incubator without being moved around or unduly handled To prevent regurgitation of any substance in the stomach into the bronchial tree, a small catheter is always placed in the stomach and aspirated repeatedly during the operative procedure It also aids in deflating the stomach, if one is trying to place the viscera back into the abdomen

To prevent loss of body heat, the extremities should be wrapped in wadding, and small warm bottles of water placed in the axilla and along the flanks and thighs The infant is placed on a porcelain tray, such as can be found in any operating room, under which is placed a hot water bottle

Anesthesia

The problem of anesthesia in the newborn is concerned with the margin of safety Even using open drop ether, which is probably the safest method, the infant is constantly in danger of a lethal dose There is a difference of opinion as to the most satisfactory type of anesthesia In my experience, open drop ether is the best When intrathoracic procedures are done, tight-fitting masks with a simple resuscitating outfit are used during the period of expansion of lung The expansion is carried out by gentle squeezing of the bag in the closed circuit

Postoperative Care

Postoperatively, these babies should be placed in an incubator with an atmosphere of 90 per cent oxygen The less they are handled, the better they fare The question of feeding in gastrointestinal cases is most important I do not believe these infants should be fed for the first seventy-two hours after anastamotic intestinal work has been done

Summary

1 A general introduction to the problem of gastrointestinal anomalies in the newborn has been presented

2 The management of the more common anomalies has been discussed in detail

3 The importance of early diagnosis and the need for surgical intervention and careful pre- and postoperative care has been stressed

factor in the placement of patients in "care" facilities is the availability of a bed anywhere Under an affiliation plan, welfare departments secure admission of public recipients to a hospital, or to its outpatient department The medical staffs of the hospital and the welfare department determine the total medical-social problems of the patient, and outline a program based on those needs, then the welfare department recommends the placement of the patient accordingly Periodically, the medical staff of the hospital and welfare caseworkers re-examine these persons in order to keep the regimen and placement in line with their changing conditions Whenever an individual in a nursing home requires diagnostic and specialist services, full use is made of total available community resources This arrangement makes possible optimal services to the patient at the lowest possible cost The medical staff of the hospital having affiliation with a nursing home functions in that nursing home exactly as it does in the hospital situation. Private patients can have these same advantages

This arrangement is advantageous to the nursing home for the following reasons (1) it facilitates a two-way flow of patients between the hospital and nursing home, (2) it identifies such homes as being an integral part of the general medical care program of the community, (3) it provides a means for the training of attendant and nursing personnel of such homes, thus assuring the operators of an adequate supply and competent personnel, and (4) it improves the quality of the preventive, medical, and health services in such homes

Since nursing homes are medical care facilities, the important consideration is the quality of the medical, preventive, and health services rather than the facility itself

The majority of licensure laws now in effect do not set minimum standards for medical services in nursing homes One exception, which merits study, is Ordinance No 2467 of the City of Fort Worth, Texas

Experience points to the need for covering all types of medical care facilities by licensure laws New York State does not have such legislation In 1946, eight states had such legislation In all of them, the health department is the licensing agency [6] Exemption of any "care" facility from requirement of licensure by the health department is not in the public interest Legislation governing "care" homes commonly exempts those that are publicly operated This practice is unsound The facts do not generally support the implied assumption that public facilities do not need supervision because they are already making an effective and necessary contribution to the total medical care program of the community

Boarding homes for older persons and homes caring for less than three sick or infirm persons seldom have to meet the requirements of such legislation Such exclusions from licensure increase the number of illegally operating nursing homes This observation is true for Nassau County, New York, where the ordinance does not cover, specifically, boarding homes for older persons There, unless the evidence is that three or more sick or infirm persons are given care for a consideration in a private home, the ordinance does not apply Medical health officers face practical difficulties in determining whether or not older persons in such homes are infirm Since such individuals seldom have preadmission and periodic medical examinations, the health official can form an opinion only on the basis of what is obvious on inspection These limitations decrease the likelihood of successful prosecution of those whom the licensing agency charges with violation of the nursing home article of the public health ordinance In Nassau County today, the number (not the capacity) of known so-called "boarding" homes for older persons and homes offering care to less than three patients exceeds that of licensed nursing homes There, health officials frequently find that the "boarding home" is, in fact, an unlicensed, second-rate nursing home

Amendment of the ordinance, in accordance with the principles given previously, offers the greatest promise of resolving these administrative problems

The following discussion shows the practical application of these principles of licensure A person files an application for a license to operate a "care" home The health department determines both the adaptability of the physical plant to such use and the fitness of the applicant to operate such a facility After completing an investigation, the health department either denies the application or issues a "care" home license for a probationary period, if, from the evidence at hand, it appears highly probable that both the plant and the operator can, within a year, meet or exceed the minimum standards either of a supervised boarding home for older persons or of a licensed nursing home A statement accompanies this license. This tells the operator exactly what he must do in accordance with a time schedule, if he is to qualify for a license to operate either a supervised boarding home for older persons or a licensed nursing home If, at any time during the probationary period, the operator fails to meet the conditions of the license to operate a "care" home, the department gives notice and later revokes that license and, if necessary, files an information During the probationary period, the department gives a great deal of educational

ers is essential in order to maintain the present standard of living (and health) in this nation

The essentials for home care of the chronically ill are a general medical-care program with care of the chronically ill inseparable from it, ready access to diagnostic and specialist service, bedside and other public health nursing services, housekeeper service, improved housing, supervised boarding homes, medical-social service, recreational and occupational therapy, vocational rehabilitation, and social security measures [1]

The author has described elsewhere the responsibility of a licensing agency for carrying on an intensive educational program in order to improve the care given in individual nursing homes [2] The discussion which follows deals primarily with the principles of licensure of "care" facilities

Widespread support is developing for several basic concepts regarding care for chronically ill persons who cannot or should not remain at home, and who do not require hospitalization The total needs of long-term patients can be met only if homes for the aged, boarding, convalescent and nursing homes are available to them Both tax-supported and privately owned facilities of these types are now generally insufficient to meet the demands for care outside the home and hospital Some communities are now operating public nursing homes Many other cities and counties are planning such facilities Those planners should consider the effect of an aging population on the need for nursing home care Barring wars, life expectancy is certain to lengthen appreciably in the future This means that persons forty-five years of age and over will comprise an increasingly larger proportion of the total population. The prevalence of chronic disease becomes greater as a population ages

To make an effective and necessary contribution to the general medical care program of a community, all types of "between the home and hospital" facilities should meet minimum standards, be regularly inspected, serve the total needs of the persons in them, and conserve the financial resources of patrons by basing charges on services actually required at a given time

The Public Health Ordinance of Nassau County, New York, provides for the licensure of nursing homes That ordinance became effective October 1, 1941 The provisions are essentially the same as those adopted previously by New York City That ordinance falls short of being a model So do most others having the same purpose Whoever attempts to improve such ordinances should keep several general considerations in mind

First, all types of facilities caring for the sick, infirm, handicapped, and aged, for a consideration, should be subject to inspection and supervision by the health department Second, provision for probationary licensure of "care" homes is an essential inclusion in a licensure law The health authorities in Nassau County, New York, agree with Potter and others that this is an effective method of raising standards [4] The public, operators, and licensing agency benefit from this procedure This device reduces the number of illegal operators, makes more facilities available, enables the licensing agency to make education rather than enforcement the keynote of supervision, and helps to establish the important relationship between cost of care and quality of services

Third, it is unrealistic and uneconomic to make the minimal standards, including fire and safety requirements, identical for supervised boarding homes for older persons and for nursing homes. The condition of the patients in them is the best criterion for regulations The ordinance should make it a violation for an operator of a boarding home for older persons to accept or to keep any person who is unable to get about without help or who has a demonstrable physical or mental disease, disability, or infirmity which, in medical opinion, constitutes an indication for attendant or nursing service The ordinance should make it a violation for an operator of a nursing home to accept or to keep any person who, in medical opinion, requires hospitalization These requirements take into account the fact that the condition of patients changes with time

Fourth, all nursing homes require medical services affiliated with the staff or a secondary hospital center [5] Additional benefits accrue to patients and facilities when both hospital and nursing homes have affiliations with supervised boarding homes for older persons The advantages of affiliations between all types of "care" facilities show up best when one compares the total services now generally given with those available under that plan An affiliation of a nursing home with a hospital makes possible the development of a smoothly operating mechanism for referral of patients from one facility to another This two-way movement of patients between facilities helps to assure the chronically ill of services geared to need, is an essential step in freeing hospital beds now occupied by long-term patients who do not require hospitalization, and saves money

Another advantage of affiliation is the opportunity which it affords for training all types of personnel giving care to chronically ill persons If the community has a specialized chronic disease hospital, that institution has the major responsibility for organizing and conducting such a training program

Under existing circumstances, the determining

RAMSAY HUNT'S SYNDROME

JOSEPH H MELANT, M.D , Buffalo, New York

(*From the Mercy Hospital*)

RAMSAY Hunt's syndrome is interesting and rare enough to justify the presentation of a single case I should like to alter the usual routine by presenting the history and physical findings first, followed by a brief historic review with a discussion of the anatomy and physiology involved, and, finally, a summary

Case Report

S M., a white man, aged fifty, was seen for the first time on March 19, 1948 He complained of severe pain, of one week duration, situated in and behind the right ear Two days after the pain had begun, blisters appeared on the ear, and right-sided facial paralysis occurred on the morning of March 18 He had been treated with diathermy for two days previous to the palsy, by the referring physician There was no vertigo or obvious disturbance in hearing sensation. His mouth felt dry

Examination revealed a complete right facial paralysis with Bell's phenomenon—on attempting to close the eyes the right eyeball turned upward and outward (Fig. 1) He was unable to wrinkle the right side of his forehead, to whistle, or to smile convincingly Epiphora was not present Absence of the sense of taste at the anterior two thirds of the tongue on the right with normal taste sensation on the left was observed the following day Muscle movements of tongue and soft palate were normal

The left ear canal and drum showed nothing abnormal. The right auricle was moderately swollen and injected. There were numerous discrete vesicles and some dry scales at the concha (Fig 2) Tuning forks of the higher frequencies were distinctly irritating to the right ear

The patient improved rapidly under simple infrared and vitamin B complex therapy X-rays or electric current stimulation was not employed A bland ointment was prescribed for the eruption, and facial massage was carried out by the patient at home The cutaneous lesions disappeared within two weeks. After another two weeks taste sensation returned and facial movements became normal, in that order He never complained of any intranasal disease nor was any found. An interesting incidental finding of herpes simplex of the left corner of the mouth was noted three days after the palsy became established (Fig 1)

It was in 1906 that Ramsay Hunt first pointed to the geniculate ganglion of the seventh cranial nerve as the site of the pathology in the syndrome that now bears his name [1] The disease designates the occurrence of herpes zoster at the auricle, usually associated with neurologic signs of the facial and also frequently of the acoustic nerves Recently, Tschiassny has found reason to disagree with some of Hunt's theories [2]

Anatomy of Facial Nerve

In order to determine the site of the facial nerve lesion it is necessary to understand thoroughly its anatomy The seventh nerve is

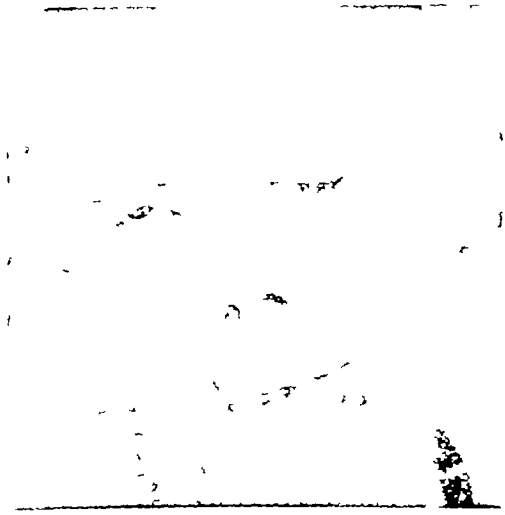

FIG 1 Complete right-sided facial paralysis with Bell's phenomenon Note lesions of herpes simplex at left corner of mouth.

FIG 2. Illustration showing dry scales at the concha

assistance to the operator If, prior to, or at the end of that period, the facility meets the minimum standards either of a supervised boarding-home for older persons or of a licensed nursing home, the department issues a license accordingly

Conclusion

The simultaneous solution of the complex and interrelated problems of chronic illness necessarily requires a cooperative program of the people in their own communities Since medicine is primarily responsible for adding years to life, an important cause of a changing social order, it cannot escape the responsibilities for helping to resolve the medical-social problems of an aging population. There are abundant signs that medicine is now frequently playing the center position on the many community service teams throughout the nation, and that it is passing the ball from one player to another in order to help the patient and his family outscore chronic illness

TROUBLES MOUNT IN ENGLAND UNDER NATIONAL HEALTH ACT

Since the National Health Service Act has been in effect in England, doctors' offices are overcrowded by persons, "many of whom have little or nothing the matter, seeking medical advice," says the London correspondent of the *J A M A*

"What may happen if we have a winter epidemic of some kind is a nightmare for the physician," his foreign letter says, adding

"The demands for drugs and apparatus is excessive For the first three months of the service the national bill for eye testing and spectacles amounted to nearly $4,000,000, for drugs $7,600,000 and for dentists, including dentures, $4,900,000 These figures do not include the cost of treatment and appliances provided through the hospitals

"An abuse of the Health Service has occurred, the extent of which cannot be stated because of the secrecy of the practice A woman obtains a prescription from a doctor for which she has little if any need. Perhaps she shams illness. She takes the prescription to a pharmacist and trades the prescription for cosmetics or other things which he sells. The pharmacist has no difficulty in getting payment for the prescription, as he returns it with those that he has dispensed Both score over this fraud. The woman obtains her cosmetics for nothing and the pharmacist probably makes an increased profit on this sale of cosmetics"

The article says that the medical profession does not reap any reasonable benefits from the act "because of the enormous waste involved—waste of time and material." "A crowning bit of extravagance may be mentioned," the article continues. "Foreigners who come to this country are to be entitled to free medical attention at the public expense for the first two months."

"DOCTOR JONES" SAYS—

Just for a change, supposing we talk about a war, but, this time, one with some cheering aspects The war against tuberculosis has been going on, in this country, for sixty-odd years and, now, success is practically in sight. Tuberculosis was a scourge long before that, but it wasn't 'til Dr Koch discovered the tubercle bacillus, in 1882, that they knew what caused it and really started fighting Now we've reached the point where, if we can throw in enough reinforcements to take the final ramparts, the war'll be won. Then all we'll have to do will be to guard the peace.

About eight years after Dr Koch discovered the germ he came out with tuberculin. It began to be used for testing cattle to find out if they were infected—and, later on, children. Around 1897 the New York City Board of Health began requiring the reporting of cases the first in the country, apparently, to do it. Laboratories began looking for the germs in specimens from patients. Incidentally, the educational work started then, on prevention of the disease, was the real beginning of systematic public health education.

In 1900, when I began getting interested, tuberculosis was the leading cause of death (The last time I checked up it was number 7 on the list) A large part of the market milk that wasn't pasteurized had live tubercle bacilli in it It was estimated that 70 per cent of the people over fifteen years old has been infected to some degree If the disease didn't get 'em the infection probably left 'em with some immunity Between that and the work that's been done the death rate has been coming down steadily until—well, you know where it is today

We've had enough experience with military matters, these late years, to know that a battle almost won can be lost by a slow-down In our war with tuberculosis now's the time to give it everything we've got.

As Joe Louis might say "When they're on the ropes turn on the heavy stuff"—*Paul B Brooks, M.D., December 20, 1948*

THEPHORIN. A NEW HISTAMINE ANTAGONIST IN THE SYMPTOMATIC TREATMENT OF ALLERGY

EMANUEL SCHWARTZ, M D , F A C P , and HARRY LEIBOWITZ, M D , Brooklyn, New York

(From the Division of Allergy of the Department of Medicine, Long Island College Hospital)

IN RECENT years various histamine antagonists have been widely used in various allergic disorders with remarkable results In 1910, Dale and Laidlaw advanced the histamine theory in anaphylactic shock and in allergic conditions [1] The fundamental observations of Lewis revealed that the physiologic response in anaphylactic shock and in allergic reactions is due to the union of antigen and antibody in the shock tissues, with the resulting liberation of an "H" or histamine-like substance [2]

Code, in his discussion of the action of histamine, stated that the effect upon smooth muscle is one of contraction, as seen in the bronchi for example, and the effect upon the capillaries is one of dilation and increased permeability, as demonstrated on the skin and mucous membrane [3] Code further suggests that there is another factor, not histamine, which is fundamental in anaphylaxis and allergic reactions, and he stresses that the sensitized cell damage is the factor responsible, with incidental release of histamine as a result of this cell damage

To discard the importance of histamine, even though secondary in the production of many allergic reactions, is illogical at this time There is evidence that the release of histamine is responsible in many allergic reactions As a result, many investigators began to search for a drug which would effectively displace or replace histamine at the cell receptors The French were the first to develop histamine antagonists Antergan (N'-phenyl-N'-benzyl-N-dimethyl ethylenediamine) was the first drug to be used Others soon followed These early histamine antagonists were found to be too toxic in the human being, although effective in animals A great number of drugs of the ethylenediamine type of chemical structure with various side-chain modifications soon made their appearance Clinical reports began to appear in 1945 and 1946, affording a great number an opportunity to try them, with various results

Feinberg summarized the subject of histamine antagonists by stating that a cure is not to be anticipated as a result of the use of these drugs, they are palliative only and in many manifestations of allergy will not be effective while other cases will be helped by the additional employment of these palliative measures [4] In other words, these histamine antagonists have not supplanted specific desensitization therapy, and, while they do not relieve all allergic symptoms, they do give a great deal of relief in a great number of patients

In 1947 a new histamine antagonist was introduced, characterized chemically by a structure totally different from those of the other drugs previously reported This drug is known as Thephorin (2-methyl-9-phenyl-2,3,4,9-tetrahydro-1-pyridindene hydrogen tartrate)

We have used Thephorin in 141 cases of various allergic conditions * This group comprised the following hay fever 60 cases, vasomotor rhinitis 55 cases, bronchial asthma 20 cases, chronic urticaria four cases, vernal catarrh one case, and contact dermatitis one case The dosage employed was 25 mg given orally three to four times daily As the symptoms improved, the dose was reduced to 25 mg once daily, to be given when necessary In the table that follows it is to be noted that unless the patient obtained 50 per cent relief of symptoms following a reasonable trial of Thephorin the result was charted as "no relief"

TABLE 1.—RESULTS OF TREATMENT OF PATIENTS WITH THEPHORIN (NU 1504)

Allergic Condition	Number of Cases	Relief	No Relief	Per Cent Relieved
Hay fever	60	46	14	76 7
Vasomotor rhinitis	55	33	22	60 0
Bronchial asthma	20	3	17	15 0
Chronic urticaria	4	3	1	75 0
Vernal catarrh	1	0	1	0 0
Contact dermatitis	1	1	0	100 0
Totals	141	86	55	61 0

Discussion of each case is not feasible The best results were obtained in hay fever, vasomotor rhinitis, and urticaria

Of 95 cases treated with Thephorin, twelve, or 12 6 per cent, complained of side-reactions No reactions encountered were severe enough in any case to cause the discontinuance of the drug

TABLE 2.—SIDE-REACTIONS IN 12 OF 95 CASES TREATED WITH THEPHORIN

Side-reaction	Number of Cases
Drowsiness	7
Dryness of mouth	3
Headache	2
Indigestion	2
Tiredness	2
Dizziness	1
Palpitations	1
Bitter taste	1

* Thephorin was furnished through the courtesy of Hoffmann La Roche ,Inc

comprised of four differently functioning elements Two are afferent (sensory and gustatory), and two efferent (motor and secretory)

Sensory Element —Here we are primarily interested in that portion concerned in the syndrome Ramsay Hunt's "geniculate zone" includes the concha, tragus, antitragus, fossa, part of the helix, antihelix, and a small portion of the lobule The fibers are conducted to their destination mainly with Arnold's nerve and partly with the auriculotemporal and the posterior auricular nerves

Gustatory Element —Briefly, taste fibers leave the geniculate ganglion and are distributed to the anterior two thirds of the tongue through the chorda tympani nerve

Motor Element —The levator palati and the uvulae muscles are supplied by the palatine nerves via the greater superficial petrosal nerve after the latter passes through the sphenopalatine ganglion The exact nerve supply of the palate remains unsettled The stapedius nerve leaves the main trunk in the middle ear and innervates the smallest striated muscle in the body The footplate of the stapes is drawn out of the oval window by the contraction of this muscle, the stapedius This reflex occurs during loud noises and is, therefore, a protection for the inner ear Contraction of the stapedius muscle decreases hearing acuity, conversely, paralysis of the muscle causes an increase in hearing sensation Up to the present this phenomenon has been called hyperacousis, but Tschiassny prefers the term "phonophobia" since there really is no increased acuity of the hearing organ but rather an increased sensitivity

Secretory Element —Postganglionic fibers leaving their respective ganglia find their way to the lacrimal gland (sphenopalatine), the mucous glands of the nose and palate (sphenopalative), the parotid gland (geniculate and otic), and the submaxillary glands (submaxillary)

In order to facilitate the location of the lesion the facial nerve is further divided into the following

Infrachordal Portion —That portion of the seventh nerve below the chorda tympani Involvement here would result primarily in facial paralysis alone If the disease is extracranial, the posterior auricular nerve escapes Thus, slight movement of the auricle is possible Sensation at the geniculate zone is not affected

Suprachordal Portion —That portion of the seventh nerve above the chorda tympani The small stapedius nerve leaves the main trunk between the chorda tympani and the geniculate ganglion Hence, the suprachordal portion can be further subdivided into an infrastapedial and a suprastapedial portion Involvement above the chorda tympani and below the stapedial nerve (suprachordal-infrastapedial) would show facial palsy plus loss of taste sensation at the anterior two thirds of the tongue on that side There would also be a decrease in the salivary flow However, a lesion situated above the stapedius nerve and below the geniculate ganglion would cause a paralysis of the stapedius muscle The patient would then lose the protection of the loud noise reflex, thus making strong auditory stimuli irritating to the ear, i e , the appearance of phonophobia It has been shown that by forcibly closing the eyes most people will experience a blowing noise in both ears This is thought to be due to an oculostapedial reflex causing contraction of the stapedius muscle and, consequently, with drawal of the footplate from the oval window A negative test means nothing unless it was positive previously This test would necessarily be negative with a lesion above the stapedius nerve

Geniculate Portion —That portion of the seventh nerve at the geniculate ganglion Signs of involvement here are as above with the addition of hypolacrimation, possible deviation of the palate and uvula to the good side, and more dryness of the mouth

Supragenículate Portion —That portion of the seventh nerve above the geniculate ganglion The signs are as above with the noted exception that the sense of taste at the anterior two thirds of the tongue returns The reason for this apparent discrepancy is that taste fibers pass off in the greater superficial petrosal nerve which leaves the ganglion, and these fibers escape the lesion

Comment

In the patient presented, the lesion would be located at the geniculate ganglion Clinically, he demonstrated the facial palsy, the loss of taste at the anterior two thirds of the tongue, the phonophobia, and the diminished salivation Because of these findings and especially because of the vesicles situated at the "geniculate zone," this case can be designated as a true example of Ramsay Hunt's syndrome as originally described

Summary

1 A case of Ramsay Hunt's syndrome is presented

2 The anatomy and physiology of the facial nerve are briefly reviewed

THE TREATMENT OF PNEUMONIA WITH PENICILLIN

Comparison of Penicillin in Water-in-Oil Emulsion and Penicillin in Water Solution*

HAROLD H COPPERSMITH, M D , WOODBURY PERKINS, M D , JAMES LELAND, M D , DICKINSON W RICHARDS, JR , M D , and K JEFFERSON THOMSON, M.D , New York City

(From the First Medical Division Bellevue Hospital and the Department of Medicine, Columbia University College of Physicians and Surgeons)

SEVENTY-NINE cases of pneumonia admitted to the First Medical Division, Bellevue Hospital, during the winter and spring of 1947 were treated with penicillin, 300,000 units every twelve hours This study consists of two series an initial group of 48 patients in which penicillin was administered in a water-in-oil emulsion containing beeswax and peanut oil, and a group of 31 patients in which the penicillin was administered in a simple water solution.

The number of patients treated is not large enough to permit definite conclusions, but the results suggest that penicillin in water solution given in doses of 300,000 units every twelve hours may constitute adequate therapy for pneumococcal pneumonia

As yet, there is little in the literature on penicillin in water solution given at twelve-hour intervals Young has described three patients treated with 250,000 units of penicillin every twelve hours, and 17 patients treated every eight hours.[1] One of the three responded satisfactorily, two gave a delayed response, requiring four to seven days. Tompsett, in a discussion of the treatment of pneumonia, mentioned 26 cases, treated with 300,000 units every twelve hours until the temperature fell, then 300,000 units once a day thereafter [2] The results were identical with those of other treatment regimens

Methods

Amorphous penicillin (Schenley), 1,000,000 units in a 100-cc vial, was used throughout the study The menstruum in the oil emulsion series was a mixture of peanut oil, beeswax, and cholesterins termed Pendil, which was heated to liquidity for emulsification with penicillin in aqueous solution.** The method of mixing the Pendil and penicillin was as follows 1,000,000 units of amorphous penicillin in a 100-cc vial were dissolved by the addition of 3 cc of sterile distilled water The dissolved 1,000,000 units were then transferred to a second vial of 1,000,000 units of amorphous penicillin. The 2,000,000 units of penicillin dissolved in 3 cc of distilled water were then mixed with 9 cc of Pendil heated to liquidity The two substances were agitated with a hand syringe into a homogeneous water-in-oil emulsion.[3] Two cubic centimeters of this emulsion, containing approximately 300,000 units of penicillin, constituted an intramuscular dose of this preparation

For the aqueous penicillin series, 1,000,000 units of similar penicillin were dissolved in 6 cc of sterile distilled water Two cubic centimeters of this preparation, which contained approximately 300,000 units of penicillin, were used for the intramuscular injection

The injections of both Pendil penicillin and aqueous penicillin were given at twelve-hour intervals in alternate buttocks

The bacteriologic studies consisted of sputum typing and culture on blood agar plates if immediate typing could not be obtained, blood culture with typing of pneumococci if growth occurred within nineteen days, and similar culture and typing of pleural fluid when obtained Sputum typing and blood culture were taken as a routine on establishing the diagnosis and before therapy was given Penicillin assays were done by the method of Hobby [4]

Clinical Material

The patients in this study were consecutive admissions in whom the diagnosis of pneumonia was based on the usual clinical and laboratory criteria, including an immediate fluoroscopy and subsequent roentgenograms of the chest No patient was included in the series who had received a chemotherapeutic or antibiotic agent prior to admission (or transfer) to the service Patients were not excluded from the series because of the presence of another illness in conjunction with pneumonia Diagnostic procedures such as white blood cell count, fluoroscopy or roentgenogram of the chest, and the collection of sputum and blood for pneumococcus typing and culture were done before the first administration of penicillin. Three hundred thousand units of penicillin were then given every twelve hours The serum levels of penicillin, as measured in a

Summary and Conclusions

1 A review of the histamine theory in allergy and the introduction of the use of histamine antagonists are presented

2 A group of 141 patients with various forms of allergy were treated with Thephorin

3 Symptomatic relief was obtained in 46 of 60 cases (76 7 per cent) of hay fever, in 33 of 55 cases (60 0 per cent) of vasomotor rhinitis, in three of 20 cases (15 0 per cent) of bronchial asthma, in three of four cases (75 0 per cent) of chronic urticaria No relief was obtained in one case of vernal catarrh One case of contact dermatitis obtained relief

4 Side-reactions occurred in 12 of 95 cases, or 12 6 per cent

5 It is concluded that Thephorin is an effective antihistaminic drug of low toxicity

FISHBEIN ANSWERS SOCIAL PLANNERS ON HEALTH

In an article entitled "Health and Social Security" in the December 25 issue of the *Journal of the American Medical Association*, Dr Morris Fishbein says that "the problem of providing medical care wherever needed is not nearly as simple as many economists and political leaders would lead the American people to believe"

"Again and again political leaders have denied that nation-wide compulsory sickness insurance is socialized medicine," the editor of the *Journal* stated, adding "Yet the nations that embark on such programs move inevitably into a socialized state in which mines, banks, transportation and practically all public services become nationalized, private responsibility and ownership disappear, individual initiative is destroyed, and the result is a socialized state At the same time that many of our political leaders oppose communism they move toward communism by embracing socialism."

In his article dealing with medical economics, Dr Fishbein reviews the amount of money which the 80th Congress appropriated for health and medical care of the American people

"Few persons realize how greatly our Federal government enters into the care of the sick under existing legislation," the article says. "In 1948 the Federal government assumed the total cost of approximately $6,000,000,000 for medical, hospital, educational and welfare needs of veterans Benefits were paid to more than 2,000,000 persons under old age and survivors' insurance program"

He reviewed many of the health bills passed by the 80th Congress and then discussed Federal Security Administrator Oscar Ewing's report to the President, entitled "The Nation's Health," which Dr Fishbein says "comes far indeed from being anything resembling a scientific document."

"Almost from the first it was apparent that Mr Ewing was stacking his executive committee," Dr Fishbein says, and "what came forth was a shrewdly contrived document, designed to break down the confidence of the American people in their medical care and pointing repeatedly to compulsory sickness insurance as the cure for misrepresentation that the document sets forth

"A peculiar folly is the suggestion that every state should have a medical school and a medical center around the school. That type of broad generalization could have been made only by someone totally lacking in a knowledge of medical education and its problems. It will take far more than ten years to accomplish that objective

"The report says that a scant 20 per cent of our people are able to afford all the medical care they need—and this in a nation with the highest standard of living of any nation in the world. Who determines how much medical care people need? What kind of medical care meets the needs of the American people? We have in the United States some 200,000 physicians, 16,000 chiropractors and 7,000 or 8,000 osteopaths, with perhaps 15,000 or 20,000 more nondescript healers of every type from faith healing to the utilization of electric gadgets. How much could be saved by the elimination of this borderline quackery? Bear in mind that no other nation in the world is subject to the amount of medical quackery that we seem to tolerate and support.

"In England, following the adoption of the National Health Act which promised everyone in England free medical service and free hospitals, free eyeglasses and free teeth, as well as everything else free in the field of medicine, the service has been marked by utter inability of the doctors, the hospitals, the pharmacists or the dentists to meet the demands placed on them by a great rush of people who wanted perhaps simply to find out how the system works

"My observations in England led me to the opinion that the quality of medical service rendered under the National Health Act would never be satisfactory to the average American laborer or farmer

"We need no revolution to advance against disease at this tremendous rate of the past forty years, nor do we need a revolution to intensify our progress The establishment of a compulsory sickness insurance system which would inevitably degrade and deteriorate the medical profession would represent a revolution and would with certainty deteriorate the quality of medical care rendered to our people. Once a nation has embarked on such a program, the ability to retrace the steps becomes less and less with every year that passes As the years go by, the quality of medical education deteriorates. As the years go by, young men seek opportunity to enter other professions than medicine Research fails to attract the type of men who in the past have given us the discoveries that have removed the fear of tuberculosis and pneumonia and of epidemic disease

"With what sophistic explanations will those who propose to tear down the great edifice of medical education, medical research and the quality of medical care that we have established in this country and to replace it with a bureaucratic civil servant type of medical care justify their conduct in the years to come?"

THE TREATMENT OF PNEUMONIA WITH PENICILLIN

Comparison of Penicillin in Water-in-Oil Emulsion and Penicillin in Water Solution*

HAROLD H COPPERSMITH, M D , WOODBURY PERKINS, M D , JAMES LELAND, M D , DICKINSON W RICHARDS, JR , M D , and K JEFFERSON THOMSON, M.D , New York City

(From the First Medical Division, Bellevue Hospital and the Department of Medicine Columbia University College of Physicians and Surgeons)

SEVENTY-NINE cases of pneumonia admitted to the First Medical Division, Bellevue Hospital, during the winter and spring of 1947 were treated with penicillin, 300,000 units every twelve hours This study consists of two series an initial group of 48 patients in which penicillin was administered in a water-in-oil emulsion containing beeswax and peanut oil, and a group of 31 patients in which the penicillin was administered in a simple water solution.

The number of patients treated is not large enough to permit definite conclusions, but the results suggest that penicillin in water solution given in doses of 300,000 units every twelve hours may constitute adequate therapy for pneumococcal pneumonia

As yet, there is little in the literature on penicillin in water solution given at twelve-hour intervals Young has described three patients treated with 250,000 units of penicillin every twelve hours, and 17 patients treated every eight hours.[1] One of the three responded satisfactorily, two gave a delayed response, requiring four to seven days Tompsett, in a discussion of the treatment of pneumonia, mentioned 26 cases, treated with 300,000 units every twelve hours until the temperature fell, then 300,000 units once a day thereafter [2] The results were identical with those of other treatment regimens

Methods

Amorphous penicillin (Schenley), 1,000,000 units in a 100-cc vial, was used throughout the study The menstruum in the oil emulsion series was a mixture of peanut oil, beeswax, and cholesterins termed Pendil, which was heated to liquidity for emulsification with penicillin in aqueous solution.** The method of mixing the Pendil and penicillin was as follows 1,000,000 units of amorphous penicillin in a 100-cc vial were dissolved by the addition of 3 cc of sterile distilled water The dissolved 1,000,000 units were then transferred to a second vial of 1,000,000 units of amorphous penicillin The 2,000,000 units of penicillin dissolved in 3 cc of distilled water were then mixed with 9 cc of Pendil heated to liquidity The two substances were agitated with a hand syringe into a homogeneous water-in-oil emulsion [3] Two cubic centimeters of this emulsion, containing approximately 300,000 units of penicillin, constituted an intramuscular dose of this preparation.

For the aqueous penicillin series, 1,000,000 units of similar penicillin were dissolved in 6 cc of sterile distilled water Two cubic centimeters of this preparation, which contained approximately 300,000 units of penicillin, were used for the intramuscular injection

The injections of both Pendil penicillin and aqueous penicillin were given at twelve-hour intervals in alternate buttocks

The bacteriologic studies consisted of sputum typing and culture on blood agar plates if immediate typing could not be obtained, blood culture with typing of pneumococci if growth occurred within nineteen days, and similar culture and typing of pleural fluid when obtained Sputum typing and blood culture were taken as a routine on establishing the diagnosis and before therapy was given. Penicillin assays were done by the method of Hobby [4]

THE TREATMENT OF PNEUMONIA WITH PENICILLIN

Comparison of Penicillin in Water-in-Oil Emulsion and Penicillin in Water Solution*

HAROLD H COPPERSMITH, M D , WOODBURY PERKINS, M D , JAMES LELAND, M D , DICKINSON W RICHARDS, JR , M D , and K JEFFERSON THOMSON, M.D , New York City

(From the First Medical Division Bellevue Hospital and the Department of Medicine, Columbia University College of Physicians and Surgeons)

SEVENTY-NINE cases of pneumonia admitted to the First Medical Division, Bellevue Hospital, during the winter and spring of 1947 were treated with penicillin, 300,000 units every twelve hours This study consists of two series an initial group of 48 patients in which penicillin was administered in a water-in-oil emulsion containing beeswax and peanut oil, and a group of 31 patients in which the penicillin was administered in a simple water solution.

The number of patients treated is not large enough to permit definite conclusions, but the results suggest that penicillin in water solution given in doses of 300,000 units every twelve hours may constitute adequate therapy for pneumococcal pneumonia.

As yet, there is little in the literature on penicillin in water solution given at twelve-hour intervals Young has described three patients treated with 250,000 units of penicillin every twelve hours, and 17 patients treated every eight hours.[1] One of the three responded satisfactorily, two gave a delayed response, requiring four to seven days Tompsett, in a discussion of the treatment of pneumonia, mentioned 26 cases, treated with 300,000 units every twelve hours until the temperature fell, then 300,000 units once a day thereafter [2] The results were identical with those of other treatment regimens

Methods

Amorphous penicillin (Schenley), 1,000,000 units in a 100-cc vial, was used throughout the study The menstruum in the oil emulsion series was a mixture of peanut oil, beeswax, and cholesterins termed Pendil, which was heated to liquidity for emulsification with penicillin in aqueous solution.** The method of mixing the Pendil and penicillin was as follows 1,000,000 units of amorphous penicillin in a 100-cc vial were dissolved by the addition of 3 cc of sterile distilled water The dissolved 1,000,000 units were then transferred to a second vial of 1,000,000 units of amorphous penicillin The 2,000,000 units of penicillin dissolved in 3 cc of distilled water were then mixed with 9 cc of Pendil heated to liquidity The two substances were agitated with a hand syringe into a homogeneous water-in-oil emulsion.[3] Two cubic centimeters of this emulsion, containing approximately 300,000 units of penicillin, constituted an intramuscular dose of this preparation.

For the aqueous penicillin series, 1,000,000 units of similar penicillin were dissolved in 6 cc of sterile distilled water Two cubic centimeters of this preparation, which contained approximately 300,000 units of penicillin, were used for the intramuscular injection

The injections of both Pendil penicillin and aqueous penicillin were given at twelve-hour intervals in alternate buttocks

The bacteriologic studies consisted of sputum typing and culture on blood agar plates if immediate typing could not be obtained, blood culture with typing of pneumococci if growth occurred within nineteen days, and similar culture and typing of pleural fluid when obtained. Sputum typing and blood culture were taken as a routine on establishing the diagnosis and before therapy was given Penicillin assays were done by the method of Hobby [4]

Clinical Material

The patients in this study were consecutive admissions in whom the diagnosis of pneumonia was based on the usual clinical and laboratory criteria, including an immediate fluoroscopy and subsequent roentgenograms of the chest No patient was included in the series who had received a chemotherapeutic or antibiotic agent prior to admission (or transfer) to the service Patients were not excluded from the series because of the presence of another illness in conjunction with pneumonia Diagnostic procedures such as white blood cell count, fluoroscopy or roentgenogram of the chest, and the collection of sputum and blood for pneumococcus typing and culture were done before the first administration of penicillin. FIG 1 Scatter graphs of penicillin blood levels in six patients after a single intramuscular injection of 300,000 units of penicillin-in-oil (top) and in six patients after a single intramuscular injection of 300,000 units of aqueous penicillin (bottom)

small number of these patients, are tabulated in Fig 1

The patients in the two series were essentially unselected The exceptions were as follows patients admitted primarily with cardiac failure who later developed pneumonia were not accepted for study, one patient with pneumonia due to Klebsiella pneumoniae was excluded because it was considered advisable to give streptomycin as well as penicillin, and one patient was excluded who had bronchiectasis, later demonstrated by bronchoscopy, and frankly suppurative pneumonia

No attempt was made to differentiate bacterial bronchopneumonia from lobar pneumonia There were no recognized cases of primary atypical pneumonia, although the possible existence of this disease in some cases in which pneumococci were not cultured from the sputum could not be excluded The majority of patients had lobar distribution of their disease with one or more lobes involved Bacteriologic identification of the causative organism was accomplished in the minority of cases However, as the season progressed, the percentage of typed cases increased

The first group was treated during February, March, and early April, 1947, and comprised 48 cases These received 300,000 units of aqueous solution of penicillin emulsified with Pendil This group is hereafter referred to as the oil series The second group treated from mid-April through June, 1947, comprised 31 cases who received 300,000 units of aqueous penicillin alone This group is hereafter referred to as the water series The onset of illness was dated from the advent of shaking chill, pleuritic pain, known fever, or hemoptysis and is, in many cases, an approximation

Results

Certain arbitrary criteria for evaluation of therapy have been established A rapid recovery is defined as a case that became afebrile within five days and had an essentially clear roentgenogram of the chest within three weeks Fever was considered a rectal temperature of 100° F or above An "essentially clear" chest roentgenogram includes those with slight haziness of the pleura or increased hilar markings extending into the affected area, still present at discharge Such patients were considered to have recovered Three patients who recovered promptly from their acute pneumonia had a persistence of parenchymal shadows by roentgenogram and subsequently developed sputa positive for m. tuberculosis These are considered cases of rapid recovery from an acute pneumonia superimposed on a tuberculous infection

Slow recovery was considered to have existed in those instances where fever persisted over five days, but in which there was otherwise a favorable and uncomplicated course

The complications of pneumonia encountered were delayed resolution and empyema The criterion of delayed resolution was a homogeneous parenchymal density by chest roentgenogram persisting after three weeks A diagnosis of empyema was made in two cases with grossly purulent fluid, although this fluid was sterile by culture

Oil Series—There were no deaths Forty-six of the 48 patients recovered without complications In general, the fever declined promptly, the average febrile period lasting three and two-tenths days after the commencement of therapy There were six patients classified as slow recoveries, five of whom had a slow initial temperature response with fever persisting past five days and one patient who had a febrile relapse the ninth day with the development of pneumonia in the other lung In this latter instance there was a satisfactory response to a second course of penicillin. This was the only occasion in which a second course of penicillin was administered

In other respects these six patients made uneventful recoveries There was one additional patient with successful recovery whose pneumonia responded satisfactorily but who had a persistent fever in conjunction with chronic pyelonephritis The only two cases in which complications developed showed delayed resolution in both. These two patients made eventual recoveries

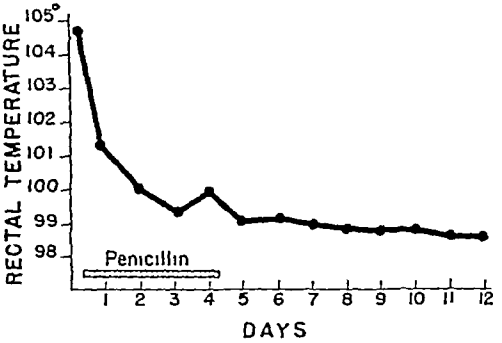

FIG 2 Temperature response of a fifty-five-year-old white man with pneumococcus, type II, in sputum and blood who received 300,000 units of *penicillin-in-water twice daily* Total *penicillin* dosage was 2,700,000 units Partial consolidation of left lower lobe was clear by x-ray within three weeks.

Water Series —Of the 31 patients treated there were two deaths One died of pneumonia seven hours after admission during which time he received one injection of penicillin The other fatal case was an elderly man with diffuse metastatic carcinoma who developed pneumonia while on the ward He died on the twelfth day after penicillin was started Of the remaining 29 surviving patients, 23 made uncomplicated recoveries (for example, see Fig 2) In this group are included two patients with slow temperature response with fever persisting seven and ten days and one patient whose persistent low-grade fever was attributed to a proved underlying tuberculosis One of these three patients had a sterile transudate in the pleural space on the same side as the pneumonia

Six of the 29 surviving patients developed complications Four of these had delayed resolution,* and there were two cases of empyema One patient with delayed resolution had a persistent patch of density by roentgenogram at six weeks, although afebrile and asymptomatic after the fifth day Further study including bronchoscopy and bronchogram failed to reveal the nature of the pathology Both of the empyema patients were chronic alcoholics with hemoglobin values below 10 Gm. per cent One was actively bleeding from the gastrointestinal tract, and the other was a repeated blood donor who had been ill ten days prior to admission Neither patient required surgical intervention The four cases of delayed resolution occurred in blood-donating chronic alcoholics with anemia Ultimately, these six cases with complications all recovered without additional treatment

Other than anemia and chronic alcoholism, the presence of one or more additional diseases or conditions (including pregnancy) in conjunction with pneumonia did not seem to influence the outcome of the pneumonia In the water series a total of 12 other types of disorder were present in 26 of the 31 patients A comparison of the results in the two series is shown in Table 1

Discussion

In this report patients in the oil series and water series are comparable with respect to age, sex, duration of illness prior to admission, and extent and severity of the disease The bacteriologically proved cases were more numerous in the water than in the oil series (Table 2) Both groups of patients received approximately the same amount of penicillin, an average of about 3,000,000 units which constituted five days of treatment Penicillin was continued until the patient had been afebrile for forty-eight hours There were a few more complications encountered in the water than in the oil series, but it seems not unlikely that these complications are an expression of the presence of more serious accompanying disorders in this particular unselected group, rather than a reflection of the method of penicillin administration It may be, however, that the therapeutic response was slightly slower in the water solution series Further work will be needed to decide this point

The presence of anemia on admission and the existence of chronic alcoholism seemed to predispose to complications Of 16 patients with hemoglobin values below 12 Gm. per cent, eight had delayed resolution or empyema Four of the patients who had delayed resolution were chronic alcoholics

The results of the treatment of pneumonia with penicillin in water-in-oil emulsion, injected twice daily, do not seem to differ significantly from the results of other studies in which other beeswax and oil menstrua were injected twice daily, nor from the results obtained from the intramuscular injection of aqueous penicillin every three hours * By and large in this study patients became afebrile in three to four days and had a clear

* Two of the four cases of delayed resolution are the same individual. This man was admitted a second time with right upper lobe consolidation forty days after discharge for an earlier right upper lobe consolidation which had incompletely resolved when the patient refused further convalescent care. He donated blood within four weeks after the first discharge. Eventually he made a good recovery

TABLE 1.—Summary of Results in Oil and Water Series

	Number of Patients	Age		Response		Delayed Resolution	Empyema	Deaths
		Over 50	Under 50	Rapid	Slow			
Oil series	48	27	21	40	8	2	0	0
Water series	31	18	13	21	2	4	3	2

TABLE 2.—Summary of Results in Cases with Pneumococcal Sputum and Cases with Pneumococcal Bacteremia

	Number of Patients	Rapid Response	Slow Response	Delayed Resolution	Empyema	Deaths
		A. Cases with Pneumococcal Sputum				
Oil series	14	13	1	0		
Water series	16	11	1	2	0	0
		B. Cases with Pneumococcal Bacteremia			2	0
Oil series	3	3	0	0		
Water series	6	4	0	1	0	0
					1	0

roentgenogram of the chest in about three weeks, irrespective of the duration or the extent of the pneumonic process. The data indicate that the response of pneumonia to 300,000 units of penicillin in aqueous solution given twice daily does not differ significantly from that of cases treated with penicillin in water-in-oil emulsion, but this series is too small to permit definite conclusions.

Special emphasis should be directed to Tables 1 and 2, giving the results of treatment in cases in which pneumococcal typing was obtained and cases with bacteremia. It will be seen that the results of both the oil series and the water series were comparable to those of other series in which the patients were treated at more frequent intervals. As shown in Table 2B, all cases of pneumococcal pneumonia with bacteremia recovered, three in the oil series, and six in the water series.

It will be noted from Fig. 1 that a therapeutic penicillin blood level (0.050 unit per cc. of serum) in the oil series persisted for twelve hours, whereas a similar level was found for only six to seven hours in the water series. This observation, plus the clinical results, implies that a sustained therapeutic blood level of penicillin may not be necessary for the successful treatment of pneumonia.

Summary

Seventy-nine patients with lobar or bronchopneumonia were treated twice daily by the intramuscular injection of 300,000 units of penicillin. Forty-eight of these cases received penicillin in water-in-oil emulsion, 31 cases received a similar amount of penicillin in aqueous solution alone. Both forms of therapy were effective. While the incidence of complications was slightly greater in the aqueous solution group, no significant differences could be established in the therapeutic results of the two series.

It is suggested that an aqueous solution of 300,000 units of penicillin given at twelve-hour intervals intramuscularly may be an effective method of treating pneumococcal pneumonia despite the absence of a sustained therapeutic blood level of the penicillin. Marshall cites evidence that a sustained blood level of penicillin is not necessary for therapeutic effectiveness in certain experimentally induced infections.[6]

THE MONTH OF MARCH

ALLERGY

ANDREW A EGGSTON, M D , New York City

(From the Manhattan Eye, Ear and Throat Hospital)

NOTWITHSTANDING earlier contributory observations which blazed the pioneer trail, the association of asthma, hay fever, and other allergic diseases with anaphylaxis and allergy did not materialize in practice until the turn of the last century It was Portier and Richet in 1902 who coined the word anaphylaxis to designate some unusual reaction following the initial inoculation of a foreign protein in animals [1]

In 1906 Von Pirquet used the word allergy to express hypersensitization to tuberculin.[2] Of late, allergy is used to describe a wide range of diseases, many having only a remote simulation to an allergic phenomenon. The pendulum has indeed swung too far when such conditions as myopia, cataracts, epilepsy, nephritis, and hypertension are explained on an allergic basis

After many years of allergic investigations and practical application, what has been wrought? Those of us who have lived through this period of allergic study and the use of many agents in the treatment of allergic diseases may well stop and try to evaluate some of the experiences of allergists in order to clarify, at least in our own minds, what has been accomplished and what improvement has been forthcoming to alleviate the many sufferings of allergic individuals

In a short discourse only a few high points of achievements and failures can be discussed First, and above all, it may be said that the development and use of allergic antigens has resulted in their intelligent use in testing, as well as in the treatment, of allergy which has added a great deal to the understanding of the subject Nevertheless, the fundamental mechanism, or modus operandi of the allergic phenomena, still lies much in the realm of the unknown. Just what constitutes the etiology or the physiochemical reactions involved in allergies certainly has not been clarified.

Much experimental work has been done to find the nature of the anaphylactic toxin responsible for the tissue reaction and shock in sensitization disease All the by-products of protein hydrolysis have been accused in the production of the violent symptoms of anaphylactic shock. Blood enzymes and antienzymes, proteins, peptones and amino acids have all been the subject of extensive investigation Up to now the outstanding formula advanced to explain many of the symptoms has been, briefly, as follows a sensitized cell develops adherent antibodies so that, when a second introduction of the specific antigen which previously illicited the antibody is given, there will result a biochemical union of the two reagents initiating a reaction and resulting in the production of histidine This is ultimately converted into histamine or H. substance, a highly toxic agent for all tissues. While the amount of histamine produced from the antigen injected is small, it further mobilizes the other latent histamine present in the tissues In 1910 Dale and Laidlaw first called attention to the similarity of the effects of histamine upon tissues and anaphylactic shock.[3] Recently, Dragstedt in 1945 observed that the role of histamine in allergy has been abundantly discussed but adds that this would not be the case if the question had been settled [4] He points out several arguments indicating that histamine plays a part in the allergic reaction

1 There is an analogy in the effects of histamine and anaphylaxis in animal and man.

2 There is present in human tissue enough histamine to cause symptoms

3 The similarity of allergy symptoms is analogous to the effects of histamine in human beings

4. It has been shown that histamine or a like substance is released during allergic reactions.

5 Clinically, the therapeutic use of histamine has been of some value in the treatment of some allergic diseases

While these statements may be true in part, the positive identification of histamine in the blood has not been made on the contrary It is true that one cannot desensitize tissues to histamine Histamine shock is not followed by the temperature and coagulation changes so characteristic in anaphylaxis Furthermore, quinine and alcohol increase the sensitivity to foreign proteins but have no effect upon the toxicity of histamine

It would seem that histamine is a concomitant finding in allergy somewhat analogous to the increase of sugar in the blood in diabetes, but neither can be accused of being the causative factors Both are the result of faulty biochemical reaction and an abnormal metabolism.

As diabetes may result from anterior pituitary, corticoadrenal, liver, and sympathetic nerve dysfunction, as well as from pancreatic pathology, likewise it is rational to consider disturbances of similar organs as playing a role in

Presented at a meeting of the Section on Otolaryngology of the New York Academy of Medicine November 19 1947

allergy Allergy as well as diabetes is inherited in recessive proportion to the Mendelian dictum of genetics Pancreatic pathology is only demonstrable in from 41 to 75 per cent of diabetics, while about 15 per cent of pancreatic pathology cases do not show diabetes, so that diabetes is due to multiple factors and not necessarily to destruction of the islands of Langerhans Allergies may well be explained by some similar metabolic dyscrasia A finality is lacking in any explanation of the complex phenomena and violent tissue reaction encountered in allergic shock Multiple causes undoubtedly interplay to produce such a biologic change

Having arrived at this point, it is time that I discussed a few practical applications and personal observations in the practice of allergy

Relation of Allergy to Rhinology

The upper and lower respiratory tracts are embryologically as well as structurally related so that the diseases of one area, such as sinusitis and bronchitis, have a correlated effect upon each other Sinusitis and allergy are so frequently associated that at times it is difficult to separate them and even more difficult to determine which preceded the other Experience has shown, however, that neither can be successfully treated if the other is neglected The essence of remedial measures is cooperation between the rhinologist and allergist, better still if someone has training in both conditions As it now appears, the two conditions can never be separated, and that is why this paper has been written and is also the reason for an allergy clinic in existence since 1916 at the Manhattan Eye, Ear and Throat Hospital for patients cleared through that institution.

Vasomotor or Perennial Hay Fever

Hay fever is probably an example of histamine tissue reaction, and the antihistamine drugs are of value but only for temporary relief These patients should take adequate nonshock dosage of specific antigens for many years While some will "outgrow" hay fever in time, this period can be shortened by proper hyposensitization injections As was expected, two groups of therapeutic procedures have developed, one of adequate dosage just short of reaction or shock and the other where only an infinitesimal fraction of an adequate dose is given The former has the sanction of immunity and anti-allergic practice, while the latter seems dilatory and inadequate, however safe to the unschooled in the usage of desensitization it may be Of these two we must, according to all immunization tenets and experience, subscribe to an adequate dosage

Perennial hay fever sufferers are legion and distressed Allergic studies help but are often disappointing A relatively small group reveals active allergic test reactions even with strong intradermal tests

Concerning the sensitization tests, I prefer the scratch test to the intradermal test because it can be made more comprehensive It is less painful and time-consuming, is highly specific, and sufficiently sensitive if a significant allergy exists The scratch test is not likely to cause a nonspecific or false reaction which frequently occurs with the intradermal technic It is also not fraught with severe or dangerous constitutional reactions The intradermal test is useful if a *more critical test* is desired Several permanent concentrated fluid extracts are now available for scratch testing so that it may be done with dispatch.

My experience with many of these hay fever cases has convinced me of a bacterial allergic factor, therefore, nose, throat, and stool cultures are routinely made upon these cases, as well as on asthmatics Escherichia coli or B Pyocyaneus are very common bacterial proteins concerned in the perennial cases and are routinely included in all autogenous vaccines along with the organism isolated from the upper respiratory tract Naturally, any extrinsic protein to which positive reactions are obtained are included

In the urticaria, conjunctivitis, and eczema cases a work-up and routine similar to those in vasomotor rhinitis are followed Many of these cases are bacterial or mycoid in origin, and the proper use of bacterial or fungoid antigens are often of value Vitamin C in large doses aids in some of these cases On the other hand, calcium and potassium have been of no value Many of these cases are neurogenic or psychosomatic and at times are very difficult to manage Dilantin has proved useful in some cases

Food allergy is an indefinite and uncertain factor when considering ingested foods, however, foods, when extrinsic in the form of powder such as wheat or rice flour, have a definite relationship to perennial hay fever, asthma, or dermatitis in certain industries

Asthma and bronchitis cover a very broad scope of allied symptoms In children asthma can frequently be shown to be allergic and the proper treatment instituted, however, in older people asthma seems to have some other, unknown factor beyond the allergic phase as a prominent cause Each case requires good history taking and long and patient forebearance on the part of the subject as well as the physicians Allergic antigens, mixed vaccines including E coli, and the careful elimination of foci of infections, as sinusitis, cholecystitis, appendicitis,

salpingitis, and infected teeth, are all valuable procedures Nevertheless, the relief of asthmatics still is far from solution Above all the injections of antigens and bacterial proteins must be continued for many years at stated intervals and without lapse in the treatment Many patients get tired too soon and discontinue injections This is very likely to occur if there are no more symptoms present In many cases the symptoms will recur when the patients give up injections with the sad result that if injections are again resumed they will not get the desired relief the second time Vaccine or foreign protein therapy is often a lifetime proposition

Histamines

The evidence of histamine playing an active role in allergy immediately stimulated investigators to try to neutralize its action upon cells Best in 1929 discovered an enzyme which neutralizes the action of histamine in vitro However, when tried clinically it soon became evident that histaminase was of no value, but great was its commercial exploitation Then followed the development of histamine-inhibiting agents Benadryl was among the first (1946) antihistaminic drugs available to the medical profession in this country This drug has been used extensively, and while it does give some relief in hay fever and allergic dermatosis, it is of little value in asthma Because of unpleasant side-effects it has lost popularity Pyribenzamine is another antihistamine drug available, and in our experience is to be preferred to Benadryl, but it too is of little value in asthma. Many drugs have been tried, namely, Antergan, Neoantergan, Anthallan, Hydryllin

In our clinic we have treated some 275 cases of various allergies with a new drug Nu-1504 or Thephorin. This drug was developed to avoid some outward effects encountered with the antihistaminic drugs now available It acts as a histamine antagonist on a different basic chemical structure One action of Thephorin is to counteract the effects of adrenalin upon arterial pressure, while most of the other known antihistamine drugs potentiate its action. Thephorin has a prolonged and sustained effect in allergy Nothing is known about the mechanism of its action, but it is suggested that the antihistamine effect is similar to Benadryl or Pyribenzamine in spite of its different chemical structure In the cases treated in our clinic it appears effective in vasomotor rhinitis, hay fever, and allergic dermatitis but is of very little value in asthma In some cases it also manifests toxic symptoms, such as nausea, vomiting, or nervous irritations. Its use is, as yet, too limited to be finally evaluated.

From my experience the place and value of histamine and antihistamine treatments in allergy have been exaggerated and are not borne out in the practical application Since this has occurred to others (we see now), there will no doubt be a new approach by some therapeutic enthusiasts who base their claims not on an antihistaminic activity but on some other nebulous action

In migraine, asthma, and neurodermatitis there are many factors besides allergy which create psychic reactions These act in a complementary fashion to instigate an allergic syndrome Evaluating these reactions requires the exercise of much intuition (or the art of medicine if you please) Such an approach is valuable in spite of fixed scientific principles of psychosomatic technic For instance, heredity, childhood neuroses, and specific emotional disturbances which accompany puberty and paternal or marital responsibility are all factors to be evaluated by good history taking

French and Alexander have offered a very comprehensive psychologic study of bronchial asthma and have particularly noted a dependent and infantile relationship to parents, etc , which, if jeopardized, would initiate asthmatic attacks [5] Weiss observed that it is possible to evaluate the physical or allergic reactions along with the psychologic factors leading to the proper management of allergic diseases [6]

Conclusion

There needs to be a resolving spirit in order to separate the true and the false, to clarify what is exploitation and what are honest efforts toward the solution of this complicated problem. One must conclude from a review of the voluminous and inconclusive literature of today that allergy has almost replaced cancer as the queen bee of diseases for exploitation because of the very complicated nature of the disease Certainly, final words have not been written on this baffling subject, but the problem as a whole is becoming slowly but definitely clearer year by year Perhaps too much emphasis on the histamine theory has had a blinding effect and caused a deflection of effort from more fruitful fields

It is apparent that in future investigations it will be appropriate to intensify the study of metabolic and endocrine disturbances, to correlate the multiple factors in allergy, to measure circulating toxins and the production of antibodies as well as antibody blocks, to develop further therapeutic perfections in the administration of pollens and other antigens in order to obtain slow nonreactive absorption, thus to maintain continuous desensitization action from fewer injections such as exists in a delayed insulin injection treatment.

Finally, if there is a known hereditary factor in a family, attempt should be made early to prevent exposure to infections and extrinsic agents to avoid the initial onset of allergic diseases This applies particularly to asthmatics with a bad family history They should use all possible preventative measures to avoid upper respiratory infections

In the practice of allergy, physicians should broaden their scope of medical interest to think more of body physiology and pathology in its correlated entirety than of the upper respiratory tract as if it were set apart

THE PSYCHODYNAMICS OF CHILD BEHAVIOR

MARVIN L BLUMBERG, M D , Forest Hills, New York

(From the Pediatric Mental Hygiene Clinic, Queens General Hospital)

CHILDREN are the most misunderstood of all persons There is no other age group toward whom so much anxiety and love, or rejection, or ambivalence is directed Thus, the child often presents as much of a dilemma for the adult as the adult does for the child The child is created through no fault or desire of his own He starts out in life naive and impressionable, with certain innate endowments, and usually with parents who will be the greatest force for good or evil during his formative years

The first question to consider is why parents have children Presumably, at least in our type of society, many children are born because of the Eros or love instinct for creation which pervades a man and a woman who are physically attracted to each other These children are usually planned for, wisely or unwisely as the case may be Some children are born because their parents' religious convictions forbid the mechanical prevention of conception Still other children are conceived accidentally by parents who are under the influence of alcohol or under the delusion of trusting to defective contraceptive devices or to "change of life" Others are created as an emergency device in the hopes of cementing a failing marriage relationship Finally, some are conceived by unwilling mothers, not for love or religious scruples or by accident, but on the deliberate advice of a doctor, as a therapeutic instrument for attempting to correct a malposition of the uterus

It is obvious that these different motives will produce different attitudes in the respective parents toward their children, and so will affect the personalities of the respective children diversely Children born of a union of love are generally wanted and are identified to some extent by each parent with the other If the parents are well adjusted in their relations with each other, the chances are that the children will be well adjusted The child who is conceived because of religious abstinence from contraception may also be well accepted by the father and mother and loved by them Religion, after all, is based on ethics and exercises a moral influence in many spheres The child who is an "accident" all too frequently is treated with the attitude that persons have toward unwelcome mishaps This individual will almost certainly be rejected, spurned, and made the butt for all that annoys the parents He will virtually be blamed for being born and will be identified by each parent with the unfavorable characteristics of the other Needless to say, the "emergency" baby rarely succeeds in improving a poor marital relationship, and, if the parents' sense of duty to the baby keeps them married, they generally never forgive the baby for this The "therapeutic" child is never thanked for the relief he may bring his mother by straightening her womb, and, not being wanted as a baby, he may be treated with apathy or rejection

Before deviate and aberrant personalities are considered, the mechanism of the development of

Presented at a meeting of the Association for the Advancement of Psychotherapy in New York City

the normal personality should be considered The psychologic development of the individual proceeds essentially along three lines—psychosexual, social, and moral. These are more or less related and overlapping For the newborn infant the entire world begins and ends in himself He is aware only of stimuli which affect his senses directly, such as cold, hunger, bright lights, and sudden loud noises He reacts most strongly to noxious stimuli and protests in self-protection He is purely an *id* creature at this level, with no demarcation between conscious and subconscious mind Then he gradually becomes aware of the outside world around him in an egocentric way He sees moving blurs, *then objects and persons* Soon he distinguishes familiar faces from others By the end of the first year he has developed an ego or *conscious purposeful response to his environment* He begins to learn and to apply restrictions to his *id* impulses Still his personality has not become clearly defined, and it is not until he is about two and a half years of age that he can differentiate persons and possessions in terms of personal pronouns Then he becomes a first person singular "I" or "me" instead of "Billy" or "the baby"

Now his social development is well on its way There also occurs the transition from a polymorphous sexuality where any and every part of the infant's body shares about equally the ability to be physically gratified, to a more specialized oral, anal, and perhaps even genital level of physical gratification, although the latter generally occurs much later The young child may indulge in an infantile type of masturbation purely for sensation, without abstract thoughts The attraction to the parent of the opposite sex makes its appearance as the child moves into the latent stage between infantile sexuality and prepubertal heterosexual interest at about five or six years of age This attraction produces identifications and imitations which serve to pave the way toward future social activity and heterosexual adjustment On the other hand, there develops latent or overt hostility toward the other parent which may produce ambivalence or remain as hostility The conflict with and acceptance of authority, or the compromise attitude toward it, arises in the relationship with the father It is during the latent stage of psychosexual development, when the child experiences the height of his oedipus conflicts, that he begins to aquire a *conscience* His actions, which were completely governed and restricted by parental approval or disapproval, now become objects of his own *censorship* As a result of the process of identification with the father, the child gradually becomes capable of introjecting the governing force within himself to form his superego or conscience. This enables him to modify his conscious and unconscious drives to produce the integrated social behavior which is the overt manifestation of his personality Thus, personality is fairly well delineated by the time the child enters adolescence No small role is played by the child's imitation of the actions and thoughts of older siblings

One can generalize and say that most personality deviations from normal are the results of psychic traumata, acute or recurrent, and usually multiple In the psychotic patient, there is an underlying disease process which may be set off by minimal or by no apparent psychic trauma. *Deviate children*, on the whole, fall into six categories (1) primary behavior disorder, (2) neurotic personality, (3) psychopathic personality, (4) mental deficiency, (5) organic brain conditions, and (6) psychoses

The primary behavior disorder appears in the *otherwise normal child* who is under stresses and tensions from such factors as rejecting parents, fighting in the home, neurotic parents who nag at him, too much pressure for scholastic achievement where the intelligence capacity is limited—to mention only a few

When marked psychic trauma is associated with specific basic functions, neurotic traits and neurotic personality develop For example, too early or too rigid weaning from breast or bottle, too early or too rigid toilet training, forcible prevention of thumb sucking, and so on, may result in functional enuresis, functional constipation, prolonged thumb sucking, nail biting, or stammering Early sex trauma, either in the form of seduction or observation, may influence the development of neurotic behavior Masturbation appears at two stages and is virtually universal in its occurrence The infantile type is merely a rhythmic physical erotism in which the genital stimulation is not accompanied by thought fantasies of sexual relations Often the genital, anal, and oral pleasures are not clearly differentiated psychologically by the very young child The adolescent type is definitely centered upon the genitals and the autoerotism is practiced with *fantasies of hetero- or homosexual activities* Psychic trauma is often related to either stage, whether due to general feelings of tension and *insecurity in the child, or to direct attention by the* parents to the act with threats or punishment on their part and reactions of guilt in the child *Such trauma may very well instigate the prolongation* of either type of masturbation into adulthood in many cases and even to the extent *of preventing the normal psychosexual adjustment* of the individual

Behavior problems in children are *manifestations of their sadomasochism* The problem

whatever it may be—enuresis, feeding difficulty, etc—begins as a demonstration of hostility against the parent or parent substitute, due to real or fancied grievances This progresses into a cycle of hostility, guilt feelings, need for and demand for punishment, further hostility as a result of punishment, and so on in self-perpetuation

The psychopathic personality is a person who is devoid of a social conscience, one who is unable to live properly in the family group or in the larger social group It has already been noted that the individual acquires his social conscience mainly by introjecting the father authority into his own mind Thus, anything that will deprive the child of his father or father substitute during his formative years may contribute to the creation of a psychopathic personality The child who grew up during the war years, without the presence of his father, and frequently with a mother working part-time, may become an antisocial delinquent The psychopathic personality is often clever and plans his repeated difficulties without feelings of remorse and with a completely hedonistic attitude

Mental deficiency and organic brain conditions, including head injuries with their sequelae and various types of epilepsy, present problems mainly in management and become serious difficulties when they are associated with detrimental environmental factors In some respects the psychoses resemble the organic mental diseases and probably owe their pathogenesis to a combination of intrinsic and extrinsic factors

Children are too often viewed as miniature adults who should think and reason as their elders but have none of their freedoms or privileges It is worth considering what children do think, or rather, how *they think* The *concept* which cannot be stressed too strongly is that, while the adult is a grown-up child, the child is not a young adult The maturity of the adult represents a qualitative as well as a quantitative metamorphosis from childhood as a result of experience, frustrations, cynicism, and the veneer of society The adult neurotic is fixated at a childish level of emotional development

The child's thought content may be compared to that of primitive, uncivilized man in his magical beliefs and in his feelings of omnipotence The child dwells in a world of fantasy where wish-fulfillment often blurs the dividing line between what the youngster believes and what he makes-believe In his day dreams, as well as in his night dreams, he kills, resurrects, transforms, and rules with ruthless, sadistic magic born of a psychologic ignorance of his own mortal limitations The young child is egocentric and amoral

These fantasies and magical beliefs are responsible in large part for the common, and at this age level, normal compulsions and ritual types of behavior Thus, children may frequently be seen walking along the street stepping on or avoiding cracks in the pavement, or touching every telephone pole or every other one There are many other types of ritual superstitious acts, some involving counting or recitation of certain phrases or formulas These actions easily become converted to and fixed as bad habits, behavior difficulties, and neurotic traits under emotional strains

The child is notably less inhibited than the adult and, therefore, reacts to pressure or inimical situations, usually with hostility, aggression, and even destructiveness On the other hand, what is frequently taken for aggression in the young child may be normal behavior for his exploring age, and what is frowned upon as destructiveness may be activity stimulated by the curiosity of the child who is probing and taking apart his environment in order to see "what makes it tick"

Why is a problem child brought to a psychiatrist? First of all, it must be borne in mind that no child is born bad, although he may have certain constitutional defects which make him more prone to deviate Thus, almost without exception, all problem children are products of their environment, and a large number owe their problems to their parents There are essentially two types of mothers who bring their offspring to psychiatrists One is sincere in her desire to correct the youngster's behavior She realizes her own responsibility and wants advice and help She has often been misguided and overanxious and responds well to correction and advice. The other type, unfortunately the majority, is the neurotic parent who expresses her own neuroses *through her child This parent has* a large amount of guilt feeling and compensates with a halo of self-justification, complaining about the child as if he were a self-perpetrating evil force She comes to the psychiatrist, not for help or advice, but to transfer the burden of responsibility for the child's badness and of its cure onto the doctor She constantly challenges the doctor and expects miraculous swift cures without cooperating with him Of course, the second type of case is more difficult and often impossible to cure Here the parent may also benefit by psychotherapy, preferably with another psychiatrist Wards of social agencies who are without parents because of either death or rejection are starved for love and react according to their experiences in society There are more psychopathic personalities in this group than among *the home-grown* problem children

The child psychiatrist must first of all have a sincere understanding of children He must think and talk to them on their own level without

any attempts at awing or impressing them. Children are too naive to appreciate bombast In general, the doctor must establish confidence and respect it He must allay suspicions by deed as well as by word He must be on the child's side and contribute to the latter's personal satisfaction. On the other hand, the doctor must be tactful with the parents and enlist their cooperation, too If the parents are too resistant and it becomes apparent that they are using the doctor as their foil, the case may prove to be very difficult

One of the major achievements of adulthood in our type of culture is the increased ability to verbalize. The average adult patient who comes to the psychiatrist does so of his own accord because he is troubled and wishes to talk about his troubles The therapy is, therefore, conducted mainly on a verbal level Conversely, the child who may be dragged, tricked, or bribed into the psychiatrist's office generally cannot or will not verbalize his troubles He lacks the adult's facility for clothing thought in language, and his suspicions and fears further block his speech. Thus, other methods have to be employed in treating children.

The term, child's play, is notoriously misconstrued For a child, playing is not merely amusement or relaxation It is his living It is more important and serious for him, in many respects, than the adult's occupation is for the latter An occupation is a means to an end, the acquiring of wealth, food, and so on The grownup has other forms of experience and social intercourse The youngster, however, learns life with its frustrations and rewards and how to live with his fellows through play Play is his serious occupation This medium is the most important tool of the child psychiatrist In playing with dolls representing adults and children of both sexes, with toy furniture, and so on, a child will be able, with the psychiatrist's help, to work out his problems For example, soldiers and war toys afford wonderful outlets for aggression

Art work is another important means of diagnosis and treatment Paints and crayons afford the child a dual method of expression, form and color Aggression will be manifested in drawings of violence and killing, compulsiveness will be depicted by repetitious, darkly and sharply outlined pictures, depression will show up in the use of dark colors, etc The bizarreness of the schizophrenic's thoughts and concepts will be reflected in his pictures, especially those of persons Modeling clay is a wonderfully expressive medium. It is three-dimensional, malleable, and resembles feces The hostile pants-soiler will mash, smear, and throw the clay around Other children will express their problems symbolically with clay

These methods of psychotherapy give the examiner some clue to the intelligence level of the child Nevertheless, the psychiatric examination should be supplemented by psychometric tests, performance, verbal, and even projective technics like the Rohrschach, where indicated Therapy helps the young patient work out his hostility, gain insight or awareness, and gain reassurance All this must, of course, be accompanied by the modification of the parents and other environmental factors The psychotic child, who is usually schizophrenic, can be aided by psychotherapy if he has a good level of intelligence and if the parents will cooperate

The question of institutionalization frequently arises The three main reasons for committing a child should be too severe a mental disturbance to allow unrestricted activity, removal of the child from a seriously inimical environment pending evaluation of his behavior and placement in a new home, and the need for more intensive observation of the case for diagnosis and appraisal Institutionalization is rarely without psychic trauma for the child He is more or less profoundly affected by such things as separation from parents and home, increased guilt feelings, fears, and anxieties due to his regarding the hospitalization as a punishment for doing evil, and exposure to other problem children with all of their bad behavior traits Whenever and wherever it is possible to do so, treatment of the child should be carried out in the office while he continues to live at home, his own or a suitable foster home It should be borne in mind that, as far as the youngster is concerned, a poor home situation or inadequate parents may often be better than none

Case Reports

EPIDERMOID CARCINOMA COMPLICATING CHRONIC OSTEOMYELITIS

EMANUEL BLUMENFELD, M D , F A C S , New York City

(From the Department of Pathology, Bronx Hospital)

THAT carcinoma may develop in old ulcers or sinuses associated with chronic osteomyelitis has long been recognized The lesion is more common in males, occurs in middle life or beyond, and is associated with foul-smelling ulcers and sinuses about the lower leg and foot The diagnosis is usually suspected by finding a cauliflower mass surrounding the fistulous opening, although in some cases there may be no external evidence of malignant disease X-rays are not characteristic and rarely reveal a typical malignancy The average duration of the draining sinuses is thirty years As a rule metastases are an exception, and the local lymph nodes, when enlarged, are usually of an inflammatory nature The following is a report of a case of carcinoma complicating chronic osteomyelitis of the tibia

Case Report

F W was admitted to Bronx Hospital, December 13, 1946 The patient gave a history of pain in the right leg and painful swelling of the right knee for two weeks Additional history from the family indicated that the patient had had chronic osteomyelitis of the right leg for over thirty years She had had two operations, the nature of which were unknown, the first thirty years previously and the second one year prior to her present admission. Small fragments of bone had been coming out of the wound since the first operation, thirty years before

During the first half of 1946, she was hospitalized at two different institutions *Records from* Knickerbocker Hospital show that she was admitted on January 12, 1946, with a bleeding ulceration on her leg It was noted that the patient had a chronic osteomyelitis X-ray of her leg revealed a well delineated bony defect of the proximal third of the tibial shaft occupying the anterior and medial aspect of the bone, surrounded by an extensive periosteocortical thickening and endosteal sclerosis There were a few minute bony sequestra within the bony defects On January 14, 1946, the ulcerated area was curetted, and culture revealed Bacillus pyocyaneus The discharge diagnosis on February 10, 1946, was chronic osteomyelitis of the right tibia with pyocyaneus infection

She was hospitalized at Fordham Hospital from March 21, 1946, to June 5, 1946 X-rays of the skull, long bones, and chest were negative The discharge diagnosis was chronic osteomyelitis of the right tibia.

Physical examination at the present admission revealed a frail, emaciated, pale, elderly white female, lying quietly in bed in no acute distress. Her temperature, pulse, and respirations were normal. The skin was clear, pale, warm, and dry and showed signs of recent weight loss An acute pharyngitis was present Heart and lungs were negative. The abdomen was relaxed, soft, nontender The right leg presented a larger ulcerated area at the upper third near the inner tuberosity of the tibia. This cavity was filled with a creamy foul pus. Removal of the pus disclosed dirty granulations at the bottom of the cavity, the walls of which contained crevices. The adjacent skin seemed continuous with the granulations which bled very easily on being wiped There was a foul and offensive odor present. The right knee was swollen, warm, and exquisitely tender Several enlarged inguinal nodes were present, and the knee was held flexed at 110 degrees, any attempted motion causing pain The admission diagnosis was chronic osteomyelitis, but malignancy was also considered

The laboratory data including urine analyses and blood counts were not remarkable except for a report of moderately severe secondary anemia, easily controlled by blood replacement Wassermann and Kahn tests were negative During her stay in the hospital, her temperature reflected an accumulation of pus in the vicinity of the lesion in her leg and a sympathetic synovitis For the first three weeks, the temperature ranged from 102 to 103 F By the fourth week, after multiple incisions and drainages about the areas of fluctuation in the upper tibia, her temperature fell to a lower level, not exceeding 101 F , and, from the fifth week to discharge, ranged between 98 and 100 F

Radiographic examination of the right leg and knee on December 12, 1946, showed a large zone of irregular bone sclerosis, occupying the upper fourth of the tibia, surrounded by a large bony defect (Fig 1) There was marked thickening of the synovia of the knee X-ray of the pelvis showed no abnormality X-ray of the chest on December 16, 1946, was negative

On December 23, 1946, pathologic examination was made of scrapings from the depth of the crater and biopsy specimens taken from the overhanging lips, including the periosteum and bone from the proximal and distal ends and depths of the crater Histologic examination of the biopsy specimen revealed the following Specimen consisted of many irregular fragments of reddish-brown and yellowish white firm tissue together with a small amount of bone The largest specimen measured 2 by 1 cm. in size The yellowish-white portions of tissue appeared to be covered on one surface by skin Microscopic section consisted of skin, subcutaneous tissue, and bone The skin was thickened in areas, and a moderate degree of hyperkeratinization was present The deeper portions of the section, including bone marrow, were infiltrated by an epidermoid carcinoma which was fairly well differentiated A number of pearls were present. A considerable number of

FIG 1 Radiographic examination of the right leg and knee December 12, 1946

round cells were seen and some polymorphonuclear leukocytes, particularly in the subcutaneous tissue The diagnosis was epidermoid carcinoma infiltrating bone marrow and chronic inflammation.

The patient was seen again on January 7, 1947 At this time there was noted a squamous cell carcinoma of the skin extending down to and diffusely involving bony structure. Upon reviewing the case and histologic report, a high thigh amputation was advised

While awaiting the report of the biopsy, multiple incisions and drainages were done about the fluctuating areas over the inner surface of the upper leg, but not involving the knee joint. Drains were left in situ, and the patient was treated expectantly until the gross infection was under control and her temperature was down. Thus, on January 17, 1947, a guillotine, flapless midthigh amputation was performed, traction being applied to the stump by means of adhesive straps. At the same time, the inguinal nodes in the groin were removed for examination. These did not reveal any evidence of malignancy

Her postoperative course was uneventful, so that by February 14, 1947, a secondary revision of the skin wound of the stump was performed followed by healing Her convalescence continued uneventfully and by March 3, 1947, she was allowed out of bed with crutches.

The pathology report was as follows

Gross Examination—Specimen is a right lower limb, 55 cm. in length, amputated 18 cm. above the knee Two incisions are present, one 11 cm in length on the posterior surface of the knee and another, 2 cm. in length, on the medial surface of the knee. These incisions were counter incisions made prior to the amputation. Five centimeters below the knee on the anterior aspect is a large ulcer eroding through all tissues into the bone There is a necrotic, grayish, friable granulation tissue present in the center of the ulcer The ulcer measures 6 cm in diameter The margins of the ulcer are smooth and covered with atrophic skin The skin on the margins extends down to the necrotic area On the longitu-

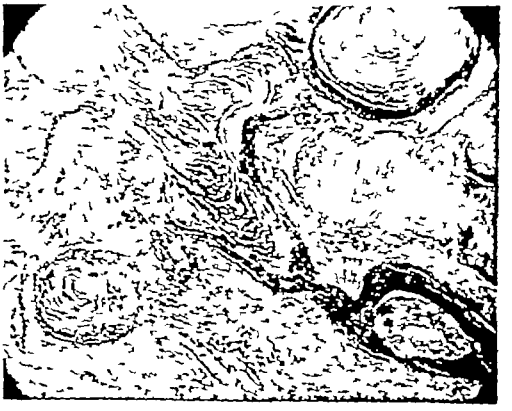

FIG 2 Photomicrograph of section of skin from area adjacent to ulceration.

FIG 3 Photomicrograph of section of bone marrow at base of ulceration—(*A*) bone trabecula, (*B*) stratified squamous epithelium.

dinal section of the bone the areas immediately above and below the ulcer are studded with areas of necrotic material exuding pus The areas are dirty gray in appearance There is no expansion, but there is marked thickening of the cortex which is intact The tibia is sclerotic immediately posterior and inferior to the ulcer The cortex below the sclerotic area is 2 mm in thickness The cortex of the femur is 2 mm. in thickness The bone marrow of the tibia and femur are replaced by soft, fatty, pinkish-yellow marrow The periosteum of the tibia and femur strips with ease The knee joint as well as soft tissues were uninvolved grossly

Microscopic Examination —The center of the specimen reveals extreme hypertrophy of stratified squamous epithelium with tremendous pearl formation The marrow reveals a diminution of normal marrow elements and fragments of trabecular bone which appears viable The marrow spaces contain a moderate amount of fibrous tissue Many of the epithelial pearls have undergone collagenous degeneration The basal layer of the stratified squamous epithelium shows disappearance of layering, with pink hyalinization of the basal layers so that they resemble a collar of hyalinized tissue, the superficial layers still retain flattened stratified epithelium Throughout, the columns of stratified squamous epithelium have increased to many times their normal thickness In no area is there normal skin In some areas, there is marked fibrosis of the marrow space through which these huge circular keratin pearls have infiltrated Pearls of stratified squamous epithelium enclose marrow spaces beneath a thick layer of granulation tissue containing many blood vessels which are empty, there is marked infiltration with round cells and polymorphonuclears, the former predominating Epithelial pearls are dispersed through the granulation tissue The surface of the granulation tissue is denuded and covered with red blood cells and polymorphonuclear cells (Figs. 2 and 3)

Conclusions

Carcinoma is a rare complication of longstanding osteomyelitis The diagnosis is easy when the lesion is superficial but difficult when it is deep-seated. Clinically, suspicion is aroused by an extremely foul odor, by the occurrence of hemorrhage, and the onset of pain without apparent reason The lesion should be thoroughly curetted and histologically examined in an effort to determine the presence of malignancy Once diagnosed, if the case does not fall into the category of local excision, amputation of the involved extremity is advocated This is usually attended by cure in view of the low grade, failure to invade, and slow-growing character of the lesion Prophylactic extirpation of all sinuses, especially epithelial-lined sinuses, would lead to the elimination of this condition

2021 Grand Concourse

The author wishes to acknowledge the kind cooperation of Dr Joseph Felsen for his review of this paper and the preparation of photographs and microscopic sections and to Dr Samuel W Boorstein for his kind permission to utilize the clinical material in this presentation.

"DOCTOR JONES" SAYS—

"Jack Spratt could eat no fat" When that first came out I don't s'pose it excited much comment in scientific circles. But, if a statement like that, about a prominent person like Mr J Spratt, was conspicuously published today it'd start some of the doctors and nutritionists speculating "Who says so?" That'd probably be their first question and then, "Why can't he eat any fat?"

They'd know (at least if they'd read the same article I have) that, for good nutrition, it's highly desirable to have fats in the human diet—enough to furnish around a quarter of the total number of calories A normal person should be able to digest it But they know, too, that the digestion of fats depends a lot on steapsin, an enzyme in the pancreatic secretion and in bile So they'd be interested to know whether Spratt had anything wrong with his pancreas or his bile-works Anyway, people that can't eat fats (plural), or think they can't, they try, nowadays, to find out why

Fats being plural that just indicates that there's different kinds of fats, depending on their chemical setup Some, like that from mutton, are harder to digest because it takes more heat to melt 'em. For that same reason some of our grandmothers used 'em to make tallow candles

The body, it seems, can manufacture fat from carbohydrate and protein foods But, to get enough that way, it takes too much bulk of those other things "Dyspepsia" is common in Japan, they say, apparently because their diet's mostly carbohydrate—not enough fat. It causes too much fermentation

The old question whether milk fat is more nutritious than the fats used in margarine—this article said that still wasn't positively *settled But one* interesting thing it said the chemical composition of human milk fat more nearly resembles margarine than butter fat When fats are scarce a fat man has temporary advantage He's got *surplus fat* in storage He's like a camel that *can live a long time* on its hump —*Paul B Brooks, M D , January 3, 1949*

Penicillin in a flavored Chicle Chewing Base

Penettes

A **new** and **different** dosage form for Intraoral Penicillin Therapy

Pleasant Here is Crystalline Penicillin G in a *pure chicle base*, as pleasant to use as the popular chewing gum confections Peppermint flavored—entirely free from any penicillin taste or odor—this new dosage form will be welcomed by patients of all ages for whom intraoral penicillin therapy is indicated

Effective One Penette maintains a therapeutic concentration of penicillin in the saliva throughout the recommended half-hour chewing period, or up to as much as 2 hours if chewing is continued Wide dispersion of penicillin throughout the entire oral cavity is assured by slow and regular chewing A total of 4 to 6 Penettes per day, combined with instrumentation or other measures as indicated, will normally arrest the majority of intraoral infections due to Vincent's organisms within 24 to 48 hours

Why not test Penettes' advantages yourself? A penny postcard will bring you a sample

Each Bristol Penette contains 10 000 units of Crystalline Potassium Penicillin G They are available in convenient purse- or pocket-sized packages of 10

PENETTES is Bristol Laboratories trademark for Penicillin Chewing Troches in a pure chicle base

NECROLOGY

David Hastings Atwater, M D , of Rochester, died on February 7 at the age of seventy-three Dr Atwater was graduated from Syracuse University, College of Medicine, in 1902, and for the past twenty-nine years had served as coroner of Monroe County A former director of the National Association of Coroners, he was a member of the New York State and Monroe County Medical Societies and the American Medical Association

John MacEvitt Auwerda, M D , ear, nose, and throat specialist of Brooklyn, died of a coronary thrombosis on January 11 His age was sixty Dr Auwerda received his medical degree from the Long Island College Hospital in 1912 and later did postgraduate work at the University of Pennsylvania He was senior surgeon at the Brooklyn Eye and Ear Hospital, consulting surgeon at Nassau Hospital, and a member of the staffs of St Mary's, Norwegian, and Holy Family Hospitals Dr Auwerda, a diplomate of the American Board of Otolaryngology and a fellow of the American College of Surgeons, was also a member of the American Medical Association and the New York State and Kings County Medical Societies

Edward Cussler, M D , sixty-six-year-old New York physician, died on February 2 Dr Cussler, a graduate of the College of Physicians and Surgeons, Columbia University, in 1904, interned at New York Hospital and continued his association with that hospital for more than forty-five years He was an assistant professor of medicine at Cornell University Medical College, a consulting physician at New York Hospital, and attending physician on the staff of the Westchester Division of New York Hospital at White Plains Dr Cussler was honored last month for his long service at the New York Hospital He was a member of the New York Academy of Medicine, the New York State and County Medical Societies, and the American Medical Association

Isidor J Ehlin, M D , of the Bronx, died on February 1 at the age of forty-seven Dr Ehlin was associate urologic surgeon at the Metropolitan Hospital where he had served his internship after his graduation from the Eclectic Medical College of Cincinnati in 1927 He was also chief of urologic surgery in the outpatient department of Lebanon Hospital and a physician in the Department of Health Social Hygiene Clinic At one time Dr Ehlin had been physician at the old Tombs Prison At the time of his death he was a member of the New York State and Bronx County Medical Societies, the American Public Health Association, and the American Medical Association

Harriet Williams Hale, M D , eighty-two-year-old retired physician, died at her home in Shushan Dr Hale, a resident of Brooklyn for more than seventy years before moving to Shushan, was graduated from the New York Medical College and Hospital for Women in 1896 and practiced medicine in New York City until her retirement in 1940 She was a former member of the staffs of Cumberland, Prospect Heights, and Memorial Hospitals, Brooklyn Dr Hale had been a member and past vice-president of the American Institute of Homeopathy and a member of the New York State and Kings County Medical Societies and the American Medical Association

Abraham M Litvak, M D , sixty-six, died at his home in Brooklyn on January 28 Dr Litvak received his medical degree from the George Washington University Medical School in 1920 and served his internship at Lincoln Hospital, Bronx, and Kingston Avenue Hospital, Brooklyn He was resident physician at the latter hospital until 1924 when he entered private practice He was director of pediatrics at Beth-El Hospital, Brooklyn, and was president of the medical board of Kingston Avenue Hospital where he was also a visiting physician Dr Litvak was an associate pediatrician at Jewish Hospital, Brooklyn

Author of more than seventy papers in the field of pediatrics, Dr Litvak was a fellow of the American College of Physicians and a licentiate of the American Board of Pediatrics He was a member of the American Medical Association, the American Academy of Pediatrics, the Brooklyn Academy of Pediatrics, the Brooklyn Academy of Medicine, the East New York Medical Society, and the New York State and Kings County Medical Societies

James F McKernon, M D , retired ear, nose, and throat specialist, died at his New York City home on January 22 at the age of eighty-three Dr McKernon, who received his medical degree from the College of Physicians and Surgeons, Columbia University in 1890, began his long association with New York Post-Graduate Medical School and Hospital in 1900 with his appointment as professor of otology He was elected president of the board of directors in 1911, resigning in 1917, and was re-elected in 1919 He served as president until his retirement in 1928 when he received the title of honorary president

Commissioned a captain in the Medical Reserve Corps in 1917, Dr McKernon helped organize Base Hospital 8, the Post-Graduate war unit, with which he served in France He attained the rank of colonel while overseas and became chief consulting otologist to the American Expeditionary Forces.

Dr McKernon, also formerly associated with the Manhattan Eye, Ear, and Throat Hospital, was a past president of the New York County Medical Society, the American Otological Society, and the American Laryngological Society He was also a fellow of the American College of Surgeons and a member of the New York Academy of Medicine, the New York State Medical Society, and the American Medical Association.

Carl Mund, M D , died on January 19 in his eighty-second year A resident of Manorville, Dr Mund was graduated from the College of Physicians and Surgeons, Columbia University, in 1892

Robert Earl Pound, M D , fifty five, died of a heart attack on February 6 Dr Pound, director of roentgenology at Lawrence Hospital, Bronxville received his medical degree from the University of Virginia Department of Medicine in 1916 In the first World War he served in France as a major in the Army Medical Corps A diplomate of the American Board of Radiology and a fellow of the

What a good tonic means to your elderly patient

The benefit of a good tonic is not entirely limited to its tone-restoring and appetite-stimulating effects Most physicians know how much the little ceremony of taking each pre meal dose of Eskay's Neuro Phosphates can brighten "the endless, daily, dull routine" of the elderly patient's life And—of great importance—"her tonic" is an ever present symbol of the reassuring and comforting fact that she is "in the care of her physician"

Eskay's Neuro Phosphates

It is prescribed so widely because it works so well

Each adult dose, 2 fluid drams (2 teaspoonfuls), contains	
Alcohol	10 per cent
Strychnine glycerophosphate, anhydrous	1/64 grain
Sodium glycerophosphate	2 grains
Calcium glycerophosphate	2 grains
Phosphoric acid, 75%	1 7 minims

Available in 12 fl oz. bottles

Smith, Kline & French Laboratories, Philadelphia

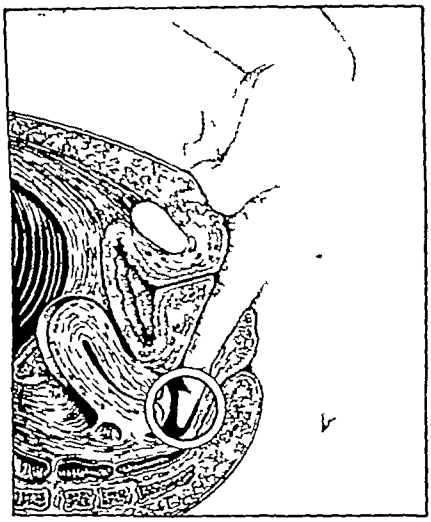
[Continued from page 550]

American College of Radiology, Dr Pound was a consultant roentgenologist on the staffs of Yonkers General Hospital, Yonkers, Misericordia Hospital, New York City, Dobbs Ferry Hospital, Dobbs Ferry, and United Hospital, Port Chester He was formerly secretary and trustee of the New York Academy of Medicine and was a member of the American Medical Association, the American Roentgen Ray Society, the New York Roentgen Society, and the New York State and County Medical Societies

Abraham Hellman Salzberg, M D, died February 4 of a heart ailment at the age of fifty-one Dr Salzberg, a Brooklyn gynecologist, was graduated from the University of Maryland School of Medicine in 1922 He was an associate gynecologist at Jewish Hospital of Brooklyn and was also a diplomate of the American Board of Obstetrics and Gynecology and a fellow of the American College of Surgeons He was a member of the American Medical Association, the Brooklyn Gynecological Society, and the New York State and Kings County Medical Societies

James S Unger, M.D, seventy-four-year-old specialist in diseases of the eye, died of a heart attack at his New York home on January 19 He was graduated from the College of Physicians and Surgeons, Columbia University, in 1896 He was a former assistant ophthalmic surgeon at the Manhattan Eye, Ear and Throat Hospital and had taught ophthalmology at the New York Post-Graduate Medical School and Hospital and at the Vanderbilt Clinic He was a member of the New York State and County Medical Societies and the American Medical Association

John Elmer Weeks, M.D, nationally known ophthalmologist and professor emeritus at New York University, died on February 2 at the age of ninety-five Dr Weeks received his medical degree from the University of Michigan Medical School in 1881 and took postgraduate work at the University of Berlin He was first assistant in the department of ophthalmology of University Medical College from 1886 to 1888 and at the College of Physicians and Surgeons, Columbia University, from 1888 to 1890 He was also professor of ophthalmology and otology at Woman's Medical College and was surgeon at the New York Eye and Ear Infirmary from 1889 to 1920 During the first World War he served as a lieutenant in the Medical Reserve Corps From 1900 to 1920 he was professor of ophthalmology at the University and Bellevue Hospital Medical College, becoming professor emeritus in 1920



Dr Weeks was codiscoverer of the Koch-Weeks bacillus and was also famous for developing an operation for inserting an artificial eye into the eye socket. He was the author of *Diseases of the Eye* and wrote more than sixty monographs on ophthalmology In 1929 he received the Ophthalmological Research Medal from the American Medical Association A past-president of the American Ophthalmological Society and the New York County Medical Society, Dr Weeks had been chairman of the ophthalmologic sections of the American Medical Association and the New York Academy of Medicine A fellow of the American College of Surgeons, he was also at one time a member of the American Academy of Ophthalmology and Otolaryngology

Abraham O Wilensky, M.D, of New York, died of a heart attack on February 4 at the age of sixty three Dr Wilensky, a fellow of the American College of Surgeons and a specialist in abdominal surgery, was the author of many works on osteomyelitis and other subjects He was a graduate of the College of Physicians and Surgeons, Columbia University, in 1907 and interned at Mount Sinai and Lying-In Hospitals He was attending surgeon at Mount Sinai, Bronx, and Beth David Hospitals, chief of the surgical service of the Brownsville and East New York Dispensary, and consulting surgeon at Crown Heights Hospital, Brooklyn He was a member of the American Association of Thoracic Surgery, the American Medical Association, the New York Academy of Medicine, and the New York State and County Medical Societies

Ward Young, M D, seventy-seven-year-old eye, ear, nose, and throat specialist of Gouverneur, died on January 26 of a heart ailment A diplomate of the American Board of Otolaryngology, Dr Young received his medical degree from Queens University, Kingston, Ontario, Canada, in 1898 He took a course in postgraduate study at the Manhattan Eye, Ear, and Throat, Hospital, New York, which he completed in 1923 He was a staff physician of the Stephen B Van Duzee Hospital, Gouverneur, and was a member of the American Medical Association and the New York State and St. Lawrence County Medical Societies

HOSPITAL NEWS

Salaries of Hospital Employes Increase 10 Per Cent

SALARIES of hospital employes increased 10 per cent, and hours of work per week decreased in 1948 over 1947, according to the fourth annual nation-wide study of hospital salaries made by the American Hospital Association. The survey was conducted among 4,623 hospitals of all types except Federal institutions

The average starting salary of general-duty nurses is $204 per month, an increase of $49 over the 1945 total and $17 per month over the 1947 average Untrained women employes receive an average of $119, untrained men, $136 Clerks receive an average of $140, and practical nurses' average monthly pay is $145, as compared with $132 for 1947

The hospital work week has decreased one hour from 1947 to 1948 for all categories of personnel except clerks, for whom the forty-four-hour week still prevails The 1948 average for all personnel is forty-five and four-tenths hours per week. General-duty nurses work an average of forty-five hours, while untrained men and women and practical nurses have an average forty-six-hour week

The highest average number of days of paid vacation, sixteen per year, was received in 1948 by general-duty nurses Clerks and practical nurses had an average fourteen days of paid vacation Thirteen days was the average paid vacation for untrained men and women

Fewer hospitals furnished complete maintenance for employes in 1948 than in previous years Where maintenance represents a portion of the gross salaries reported, however, value of room and board is computed in relation to the Cost of Living Index of the United States Department of Labor, Bureau of Labor Statistics, on a computed scale for all sections

"Salaries and employe maintenance service, because they constitute over one half of total hospital expenditures, are of major concern to hospital administrators and to patients who pay for hospital care," said George Bugbee, executive director of the American Hospital Association

"This survey indicates that American hospitals have markedly bettered their personnel programs in the past year, with regard to salaries, hours of work, paid vacations, and related problems of effective personnel administration," Mr Bugbee stated "The result is constant improvement in hospital care offered to the American people"

Hospital Honors Fifty-Year Doctors

FIVE physicians who have been practicing medicine for fifty years were honored January 23 by the trustees of Lebanon Hospital, the Bronx, at a testimonial dinner at the Waldorf-Astoria Hotel, New York City

The doctors honored were Dr Henry Roth, surgeon, Dr Abraham J Rongy, gynecologist, Dr Sidney V Haas, pediatrician, Dr M D Lederman, ear, nose, and throat specialist, and Dr William Weinberger, specialist in internal medicine

L Victor Weil, president of the hospital, which is located at 1650 Grand Concourse, the Bronx, and is an affiliate of the Federation of Jewish Philanthropies of New York, presented each doctor with an engraved plaque "for his service to the community and to Lebanon Hospital."

Mount Sinai Starts $7,000,000 Building Project

TO MEET increasing demands for its services and to intensify its educational and research activities, Mount Sinai Hospital of New York has embarked on a $7,000,000 expansion program that will add a ten-story maternity pavilion and two research laboratories to its present 17-building plant, Alfred L. Rose, president of the institution, has announced

The three buildings soon to rise are

1 Maternity Pavilion—The first in the hospital's ninety-six-year existence will include an Institute of Biogenetics for education and research It will have 160 beds of which a large proportion will be for ward and semiprivate patients, although it will also accommodate private patients.

The maternity service will offer continuous care during pregnancy, childbirth, and the lying-in period and will train mothers in the handling of their babies. In addition, the institute will have facilities for clinical and biologic research into all phases of human reproduction and will serve as a teaching center

2 General Laboratory Building—A seven-story structure, it will front on Madison Avenue and extend a wing westward toward the new maternity building Equipped with a central system for piping oxygen, vacuum, and suction, it will have a floor space of over 50,000 square feet for routine laboratory examinations, research into new medical fields, and the broader training of physicians.

The hospital's chemistry, physics, and bacteriology departments will be moved to this building, and their present quarters will be renovated to be used exclusively by the pathology department.

3 Berg Institute of Research—This building will be limited to specialized investigative work by a small group of researchers Its eastern wall will abut the new laboratory building Its purpose is to provide seclusion for advanced research fellows while making available to them the facilities of a general laboratory and of an entire hospital The building will bear the name of Dr A A. Berg, a distinguished surgeon on the staff of the hospital, who donated the funds for its construction.

Now nearing its centennial, the hospital was founded in 1852, and its first quarters were a four-

"CHANGE TO PHILIP MORRIS

OR...

CUT DOWN YOUR SMOKING!"

That is the suggestion of many of the country's leading specialists in cases of throat irritation.*

Many doctors have among their patients some who they believe smoke too much But the difficulty of persuading such smokers to cut down is familiar to everyone What better advice therefore than *"Change to Philip Morris"* the only leading cigarette proved definitely and measurably less irritating

To minimize cigarette irritants, Philip Morris are made by a special process whose advantages are conclusively shown in published studies ** These studies may convince you too that the most effective advice for patients who smoke is *"Change to Philip Morris"*

PHILIP MORRIS
Philip Morris & Co , Ltd , Inc
119 Fifth Avenue, New York

ARE YOU A PIPE SMOKER? We suggest an unusually fine new blend — COUNTRY DOCTOR PIPE MIXTURE Made by the same process as used in the manufacture of Philip Morris Cigarettes.

story building with 45 beds at 138 West 28th Street In 1862, the facilities were increased to care for wounded Federal soldiers in the Civil War Ten years later the hospital moved uptown to a building on Lexington Avenue from 66th to 67th Streets, with three and one-half stories and 120 beds

Mount Sinai appointed two women to its professional staff as early as 1872, granted a diploma in 1886 to the first woman in America to serve a formal internship, established separate medical and surgical services in 1877, opened one of the first nursing schools in 1881, converted a cloak room into its first laboratory in 1893, and in 1906 started one of the first medical social service departments.

The cornerstone of the present group of buildings was laid in 1901 the original ten buildings have a capacity of 456 beds The current expansion will give the hospital, which now serves almost 20,000 persons a year, a capacity of a thousand beds and a group of 20 buildings extending from 101st to 98th Streets and from Fifth to Madison Avenues

City Hospital Announces Ward Teaching Program

CITY Hospital, Welfare Island, New York, has announced a practical ward-teaching program under the direction of Dr Carl Reich, attending physician in charge of First Medicine Beginning on February 1, the program will continue for three months until May 1 and is free to members of the medical profession Inquiries may be made at City Hospital.

The program for each week is as follows Monday —psychosomatic medicine, peripheral vascular disease, metabolism, Tuesday—endocrinology, arthritis, cardiovascular and renal diseases, gastroenterology, Wednesday—diseases of respiratory system, diseases of liver, gastroenterology, pathologic physiology, Thursday—arthritis, allergy, tropical medicine, parasotology, and Friday—correlative roentgenology, hematology, cardiovascular and renal diseases

Staff members taking part in the teaching are Drs Seymour Fiske, Joseph Henry Hodas, Ernest Hammerschlag, Albert Hyman, Benjamin Jablons, Frank S Pierson, Cyril Solomon, and James Edlin, associates, Drs Leon Bader, Joseph Bandes, Harvey Brandon, Albert Cornell, Milton Drexler, Daniel H Eichner, Alfred Fritsch, Emil Granet, Milton M Greenberg, Sanford Goodfriend, John F Maloney, E Milton Sachs, Norman A. Samuels, Max Sterman, and Sydney Bassin, assistants, and Dr Arthur Forst.

NEWS NOTES

Conferences on neoplastic diseases are held at Montefiore Hospital, the Bronx, on the first and third Friday of each month, at 3 00 P M Speakers and topics for January were January 7—"Diagnosis and Management of Esophageal Lesions," Dr John Pool, associate attending surgeon, Memorial Hospital, and January 21—"Early Diagnosis and Treatment of Cancer of the Breast," Dr Cushman D Haagenson, assistant professor of surgery, College of Physicians and Surgeons, Columbia University

Dr William R Carman was elected president of the staff of Southside Hospital, Bay Shore, at the meeting held December 28 Other officers elected are Dr Myron L Hafer, vice-president, Dr Warren H Eller, secretary-treasurer, and Dr Sol Shlimbaum, member-at-large

Dr Robert Gordon Douglas has been appointed s professor of obstetrics and gynecology at Cornell Jniversity Medical College and gynecologist-in-hief at New York Hospital, effective July 1, 1949, ccording to an announcement made January 30 Jis predecessor, Dr Henricus J Stander, died May , 1948, since when Dr Douglas has been acting di-ector of the department

According to the annual report of the Ossining ospital, Ossining, for 1948, a total of 2,848 patients eceived 24,035 days of care, making an average of 3 patients under care each day, which is 84 per cent capacity

Dr Bruno J Tryka of Perry has been elected esident of the staff of the Wyoming County Com-unity Hospital, succeeding Dr R. T Williams of arsaw Other officers are Dr Charles O Wagen-os, Warsaw, vice-president, Dr Paul A Burge-n, secretary, Dr Clifford H Harville, Warsaw, ief of obstetric service, and Dr Willard J Chapin, erry, associate chief of obstetrics

Dr Frederick K. Gifford has been elected president of the Rome Hospital medical staff to succeed Dr Henry N Reid. Other staff officers are Dr Edward E Powers, vice-president, Dr Edward D Dake, secretary-treasurer, Dr Rudolph E Vanderveer, chairman, and Dr Lawrence S MacMillan and Dr Roy J Marshall, executive committee

Dr John H. Lawrence, director of Donner Laboratory of Medical Physics, University of California, Berkeley, California, delivered the William Henry Welch lectures on February 2 and 4 at Mount Sinai Hospital His subjects were "Tracer Studies with Artificial Radioactivity" and "Therapeutic Studies with Artificial Radioactivity"

Dr Mark A Freedman, formerly assistant director of the Bronx Hospital, New York, has been named associate director of Montefiore Hospital of New York Dr Freedman was executive officer of the Fifth General Hospital in England for three and a half years during the war

Dr Howard McC Snyder, former wartime inspector of medical operations for the War Department, has been appointed special consultant to Columbia University's New York State Hospital Study, Dr Eli Ginzberg, director of the study, has announced.

EW YORK CITY HEALTH IN 1948

In the preliminary report by Dr Harry S Mus-rd, New York City Commissioner of Health, the lowing items are of interest

There were 157,184 births and 81,793 deaths re-rded in New York City in 1948

Births in 1948 were about six per cent below the 47 total, but the number is higher than any year ner than 1947 More than half of all deaths in 48 were of persons over 62 years of age, giving mphasis to the problem of the diseases of later life.

The infant mortality rate for 1948 was the same as 1947, the lowest on record for New York City ore than 75 per cent of all the infant deaths oc-rred in the first month of life

Maternal mortality rate which began a steady de-ease 12 years ago is still declining, although more owly The 1948 rate of 1 0 per 1,000 live births as the lowest in the history of the City

The downward trend in diphtheria cases and eaths which has been going on for decades but hich was interrupted by a backwash from Euro-ean epidemics was resumed in 1948 There were wer diphtheria cases and deaths here in 1948 than any previous year

New low records were set in whooping cough and scarlet fever cases and deaths *Measles regularly* occur in alternating cycles of "low" followed by "high" years and 1948 was a "high" year with the disease reaching epidemic proportions in New York City However, the death rate was low

In the United States polio cases topped every year since 1916 Although there were more cases in 1948 than 1947 New York City escaped an epidemic. The case mortality rate was the lowest on record.

A new all-time low record was *set for typhoid* fever cases in New York City in 1948, fifty-one cases were reported, with four deaths.

The increase in the number of newly reported cases and decline in the pulmonary death rate seen here in 1948 is a trend noted *since 1945*

Pneumonia situation was practically unchanged The rate declined to a still lower level than in 1947

The decline in appendicitis deaths, which began in the late 1930's, continued in *1948 There were 248 deaths, an incidence of 3 1 per 100,000*

There were more deaths from cancer and deaths from diabetes in 1948 than ever before in the history of the City Deaths from diseases of the heart, arteries, kidneys, and apoplexy were higher than any year except 1943

In Hypochromic Anemia

OVOFERRIN . . . The build-up without a let-down is a favored prescription because it is ACCEPTABLE . . . even to children EFFECTIVE . . . equally for all ages

Unlike ionized iron products, Ovoferrin (iron in colloidal form) is not only easily assimilable but is virtually unaffected by the gastric juices Thus, this unusual iron preparation avoids the gastric upsets which so frequently attend the use of usual ionized iron preparations

Because it lends itself so perfectly to the patient s acceptance and the physician s objective, Ovoferrin really bridges the gap between iron deficiency and effective iron therapy Physicians are invited to learn first hand of Ovoferrin advantages by the use of generous professional samples

℞ MAINTENANCE DOSAGE

For Adults and Children One teaspoonful 2 or 3 times a day in water or milk.

℞ THERAPEUTIC DOSAGE

ADULTS One tablespoonful 3 or 4 times daily in water or milk CHILDREN One to 2 teaspoonfuls 4 times daily in water or milk

Professional sample on request

MEDICAL NEWS

Ceremonies Honor First U S Woman Doctor

ONE HUNDRED years ago, on January 23, 1849, Elizabeth Blackwell, America's first woman doctor, was graduated from college Two commemorations of the event were held recently At the New York Infirmary, which was founded by Dr Blackwell four years after her graduation, five woman doctors received Elizabeth Blackwell Citations for distinguished achievement in medicine At Geneva, Hobart College, Dr Blackwell's alma mater, honored twelve other woman doctors with similar citations

Elizabeth Blackwell Centennial citations were conferred by Dr Alan W Brown, president of the Geneva colleges, at a special convocation on the following woman doctors

Dr Florence R. Sabin, Denver, Colorado, for medical research, Dr Alice Hamilton, Hadlyme, Connecticut, for industrial medicine, Dr Helen B Taussig, Baltimore, Maryland, for clinical medical research, Dr Martha May Eliot, Washington, D C , associate chief, U S Children's Bureau, for public health, Dr Gerty T Cori, Webster Groves, Missouri, for work in biochemistry and pharmacology, Dr Priscilla White, Boston, Massachusetts, for work in the field of diabetes, Dr Helen V McLean, Chicago, Illinois, for psychiatry, Dr Margaret D Craighill, Topeka, Kansas, Chief of Service, Medical Care of Women Veterans, Winter Veterans Administration Hospital (first woman commissioned as major in Army of United States) for military medicine, Dr Helen MacMurchy, C B E , Toronto, Canada, former chief of the Division of Child Welfare, Department of Health, for her work in the fields of child welfare and public health in Canada, Dr Elise S L'Esperance, New York, for her work in pathology and cancer prevention and leadership of women in medicine, Dr Helen M M Mackay, F R C P , London, England, internationally known pediatrician and first woman to be elected to the Fellowship of the Royal College of Physicians, and Dr Therese Bertrand Fontaine, Paris, France, first French woman medicin des hopitaux.

Elizabeth Blackwell Citations presented by the New York Infirmary were as follows Dr Lauretta Bender, senior psychologist in charge of the Children's service of Bellevue Hospital, Dr Connie Myers Guion, chief of the medical clinic, outpatient department, New York Hospital, Dr Anna Hubert, director of the department of surgery and gynecology of the New York Infirmary, and Dr May Wilson, chief of the Pediatric Cardiac Clinic of New York Hospital Dr Ada Chree Reid, chief of the cardiac clinic of the New York Infirmary and medical staff member of the Metropolitan Life Insurance Company, was unable to attend.

Geneva College, now Hobart, was the twenty-ninth college to which Dr Blackwell applied for admission to study medicine All the others turned her away The Geneva institution put it up to the students, and Dr Blackwell was admitted by popular vote

Born in Bristol, England, February 3, 1821, she came to the United States in August, 1832, lived for six years in New York and Jersey City, and at the age of seventeen went to Cincinnati, Ohio She taught school in Asheville, North Carolina, and Charleston, South Carolina, in 1845 and 1846 to gain money for a medical education.

She founded the New York Infirmary for Women and Children in New York and the Woman's Medical College there In 1859 she gained the honor of being the first woman to be listed in the British Medical Register and in 1875 helped to found and taught at the first school of medicine for women in England She died at Hastings, England, *May 31*, 1910, and is buried at Kilmun, Argyllshire, Scotland

Army Surgeon General Announces Community Campaign

A PROGRAM to unite professional and civic support in every community behind a campaign to meet urgent manpower requirements of the Army Medical Department through volunteers has been announced

It involves setting up Professional Manpower Committees in communities and coordinating them with the existing Military Manpower Committees which are already helping the general recruiting campaign The medical program is part of the drive to obtain physicians, dentists, nurses, and other medical specialists in order to meet the needs for medical care of the services

The program was worked out by the Army Medical Department in cooperation with the U S Army and U S Air Force Recruiting Service. In communities, outstanding physicians, surgeons, dentists, and other leading medical specialists will be asked to serve on Professional Manpower Committees, which will be set up as subcommittees to the Military Manpower Committees which are already assisting the Recruiting Service The cooperation of existing Army Advisory Committees also will be sought, particularly in the larger cities

The plan for civilian aid to medical personnel procurement has been developed in consultation with the national societies representing the professional fields involved It will seek the help of local units of professional organizations and enlist the cooperation of local chapters of many veteran, civic and fraternal groups which have been helping the services in their recruiting campaigns

MEDICALLY SPEAKING

Medical Schools Offered to State—Two medical schools were offered as gifts to the newly created New York State University in a bid to have the State take over their facilities rather than build new medical colleges The offers, one from the Long Island College of Medicine and the other from Syracuse University Medical College, were made at an all-day hearing held January 10 by a committee on medical education centers of the State University's board of trustees, in New York City The University plans to build or take over a medical center in

Case History of an overweight streetcar-operator . . .

'Dexedrine' Sulfate—because it curbed appetite and lowered food intake—enabled even this extremely obese patient to lose weight easily and safely without the use (and risk) of such potentially dangerous drugs as thyroid.

Patient before treatment (age 53; height 5' 10½") weighed 352 pounds . . . was suffering from hypertension, nervousness and dyspnea . . . lived in fear of causing an accident while on duty. Overeating was the only demonstrable cause of his obesity.

Therapy 'Dexedrine' (15 mg. A C t i d)	Results	Weight	B P	Pulse
March, 1946	'Dexedrine' therapy begun	352	280/152	86
November, 1946	8th month of 'Dexedrine' therapy	269	160/84	86
January, 1948	22nd month of 'Dexedrine' therapy	234	158/84	86

In addition to the weight reduction of 118 pounds and the concurrent lowering of blood pressure, a remarkable improvement is reported in the patient's mood and outlook. Earlier nervousness and fears have vanished.

Dexedrine* Sulfate tablets and elixir .... the most effective drug for control of appetite in weight reduction.

in Albany, Dr Harry Little of Hudson spoke on "Orthoptics in the Treatment of Eye Muscle Imbalance" Assisting was Dr Little's associate, Miss Elizabeth Rose, a diplomate of the Council of British Ophthalmologists

Saranac Lake Medical Society

Dr Howard A. Rusk, chairman of the department of rehabilitation and physical medicine, New York University College of Medicine, spoke on "Dynamic Therapeutics in Chronic Disease" at the meeting of the Saranac Lake Medical Society held February 9

Tuberculosis Sanatorium Conference of Metropolitan New York

The Tuberculosis Sanatorium Conference of Metropolitan New York held a clinical session on chronic pulmonary diseases February 9 at the Cornell University Medical College auditorium, New York City Dr Carl Muschenheim acted as chairman, and participants were Dr John N Hayes, medical director of Gabriels Sanatorium, "The Present Status of Pneumothorax", Dr Roger S Mitchell, associate medical director, Trudeau Sanatorium, "The Present Status of Phrenic Nerve Interruption in the Treatment of Pulmonary Tuberculosis," and Dr Ralph E Moyer, chief of the tuberculosis service, Veterans Administration Hospital, Oteen, North Carolina, "The Value of Pneumoperitoneum in the Treatment of Pulmonary Tuberculosis."

Society of Medical Jurisprudence

Dr Sigmund Epstein spoke on "Famous Wheel chair Invalids in American History" at the meeting of the Society of Medical Jurisprudence held February 14 at the New York Academy of Medicine In addition, Dr Henry H Kessler, orthopedic consultant for the Office of Rehabilitation, New Jersey, spoke on "Rehabilitation of the Amputee."

Geneva Academy of Medicine

A program of postgraduate instruction was presented at the meeting of the Geneva Academy of Medicine held February 17 in Geneva, with Dr Samuel Kleinberg, New York City, speaking on "Back Pain" The program was arranged by the Council Committee on Public Health and Education of the State Society, with the cooperation of the State Department of Health

FUTURE

New York University College of Medicine, Alumni Association

Panel discussions to aid the general practitioner are being held at the New York University-Bellevue Medical Center, under the sponsorship of the Alumni Association of the New York University College of Medicine All sessions will be held from 8 30 to 10 00 P M , and arrangements are under the direction of Dr William Goldring, chairman of the committee on science and education of the Alumni Association

The program is as follows

March 2—"Hypertension" Dr Herbert Chasis, moderator, and Dr Goldring, Dr William Hinton, and Dr Homer W Smith, speakers

March 30—"Peripheral Vascular Diseases" Dr Ludwig W Eichna, moderator, and Dr Wallace B Murphy, Dr Julius J Sachs, and Dr E M Papper, speakers

April 27—"Congenital Heart Disease" Dr C E de la Chapelle, moderator, and Dr Janet S Baldwin, Dr Charles E Kossmann, Dr Herbert C Maier, and Dr Henry K. Taylor, speakers

May 25—"Chemotherapy in Medicine and Surgery" Dr Colin MacLeod, moderator, and Dr Henry H Balch and Dr Joseph J Bunim, speakers

American Academy of General Practice

The first annual scientific assembly of the American Academy of General Practice will be held at the Netherland Plaza Hotel, Cincinnati, Ohio, on March 7, 8, and 9 Among the speakers who will present papers are Dr Walter C Alvarez, Rochester, Dr Howard A. Rusk, New York City, and Dr Herman G Weiskotten, Syracuse

New York Academy of Medicine, Section on Microbiology

A symposium dealing with "Certain Aspects of the Biology, Metabolism, Immunity, Diagnosis, and Treatment of the More Common Human Parasitic Infections" will be held at the New York Academy of Medicine, under the auspices of the Section on Microbiology, on Tuesday evening, March 15, and Wednesday afternoon and evening, March 16

Speakers and their topics will include Dr Paul Russell, Rockefeller Foundation, "The World Health Importance of Parasitic Diseases", Dr Clay Huff, National Naval Medical Center, "The Significance of New Findings in the Life Cycle of Malarial Parasites", Dr James T Culbertson, National Institute of Health, "Immunologic Mechanisms in Parasitic Infections", Dr Norman Stoll, Rockefeller Institute, "Diagnosis of Intestinal Helminths and Protozoa", Dr William Frye, Tulane University, New Orleans, "Studies on Growth and Metabolism of Endamoeba Histolytica", Dr T von Brand, National Institute of Health, "Physiology of the Blood Flagellates", Dr Quentin M Geiman, Harvard University, "Cultivation of Malarial Parasites", Dr Ralph McKee, Harvard University, "Biochemistry and Metabolism of Malarial Parasites", Dr Ernest Bueding, Western Reserve University, "Metabolism of Helminths", Dr Hamilton Anderson, University of California, "Pharmacologic Evaluation and Clinical Application of Amebicides", Dr Robert Coatney, National Institute of Health, "The World Status of Antimalarial Drugs", Dr Harold Brown, Columbia University, College of Physicians and Surgeons, "Therapy of Filariasis and the More Common Intestinal Helminths," and Dr Frederick Brady, National Institute of Health, "Chemotherapy of Schistosomiasis"

Glens Falls Academy of Medicine

Dr Bradley L Coley, assistant professor of clinical surgery, Cornell University Medical College, will speak on "Diagnosis and Treatment of Bone Tumors" at a meeting of the Glens Falls Academy of Medicine, to be held Thursday, March 17 The program, postgraduate instruction arranged by the Council Committee on Public Health and Education of the State Society with the State Department of Health, will begin at 8 30 P M in the Glens Falls Library

Time and tide

in modern diuretic therapy

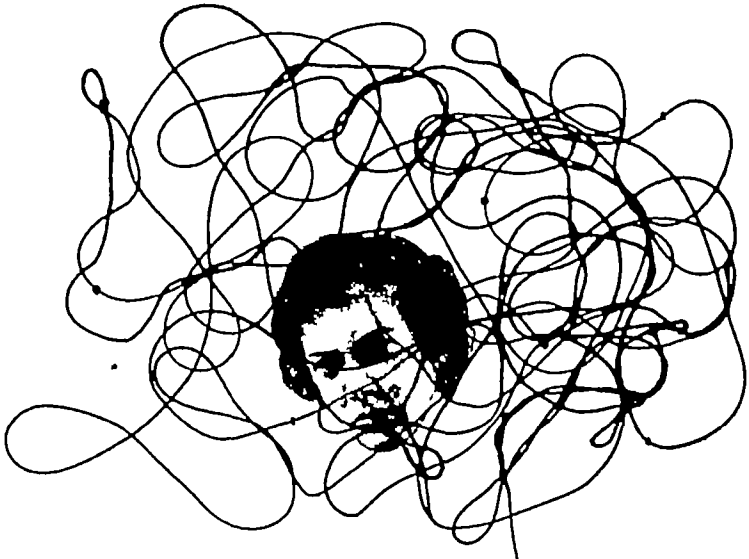
Timely injections of MERCUHYDRIN combat the rising tides of edematous fluid and check recurrences by mobilizing water-binding sodium[1] and stimulating its urinary excretion.

MERCUHYDRIN facilitates the recommended frequent-dosage schedules[2] of modern diuretic therapy Convenience high local tolerance[3, 4, 5] and increased safety of the intramuscular route[6] foster the maintenance of a relatively constant level of body fluid by repeated injections[7] thus sparing patients the distressing consequences of intermittent massive diuresis

Prompt inauguration of MERCUHYDRIN diuresis in cardiac patients exhibiting *nocturnal dyspnea, orthopnea, pulmonary râles cardiac* asthma and insomnia relieves discomfort and prolongs life[8]

MERCUHYDRIN®

well tolerated locally, a diuretic of choice



Administration prior to or concurrently with digitalization avoids *driving the faltering heart against an accumulated fluid burden* and prevents the overdigitalization which may occur when postponed diuretic therapy mobilizes previously administered cardioactive glycosides from edema fluid.[9]

DOSAGE 1 cc. or 2 cc. intramuscularly or intravenously given daily or as indicated until a weight plateau is attained. Subsequently the interval between injections is prolonged to determine the maximum period permitted to intervene between maintenance injections

PACKAGING MERCUHYDRIN (meralluride sodium) is available in 1 cc. and 2 cc. ampuls.

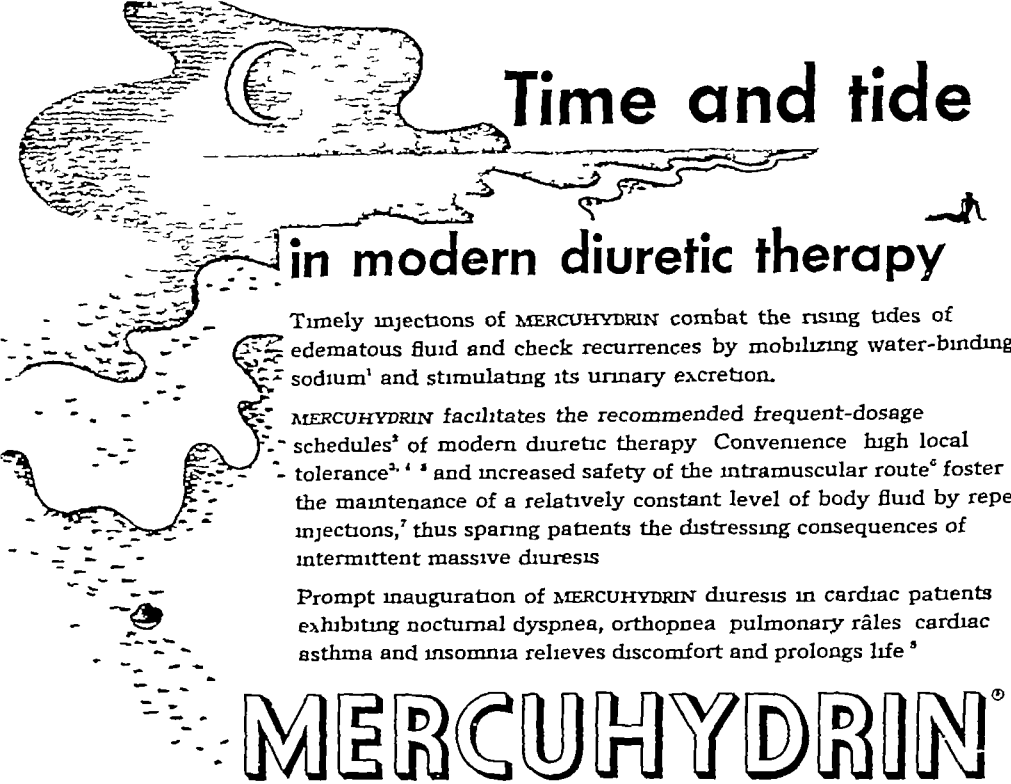
To re-establish emotional equilibrium

'Benzebar' combines the effective anti depressant action of Benzedrine* Sulfate and the mild sedation of phenobarbital.

The 'Benzedrine' Sulfate in 'Benzebar' restores optimism, cheerfulness and sense of well being, increases mental activity and interest in life, imparts a feeling of energy and alertness

Simultaneously, the phenobarbital component calms nervous excitability and agitation, relieves anxiety and tension

Thus, 'Benzebar' is valuable in the symptomatic treatment of the depressed patient who displays anxiety or agitation



Benzebar

a logical combination of 'Benzedrine' Sulfate (5 mg) and phenobarbital (¼ gr)

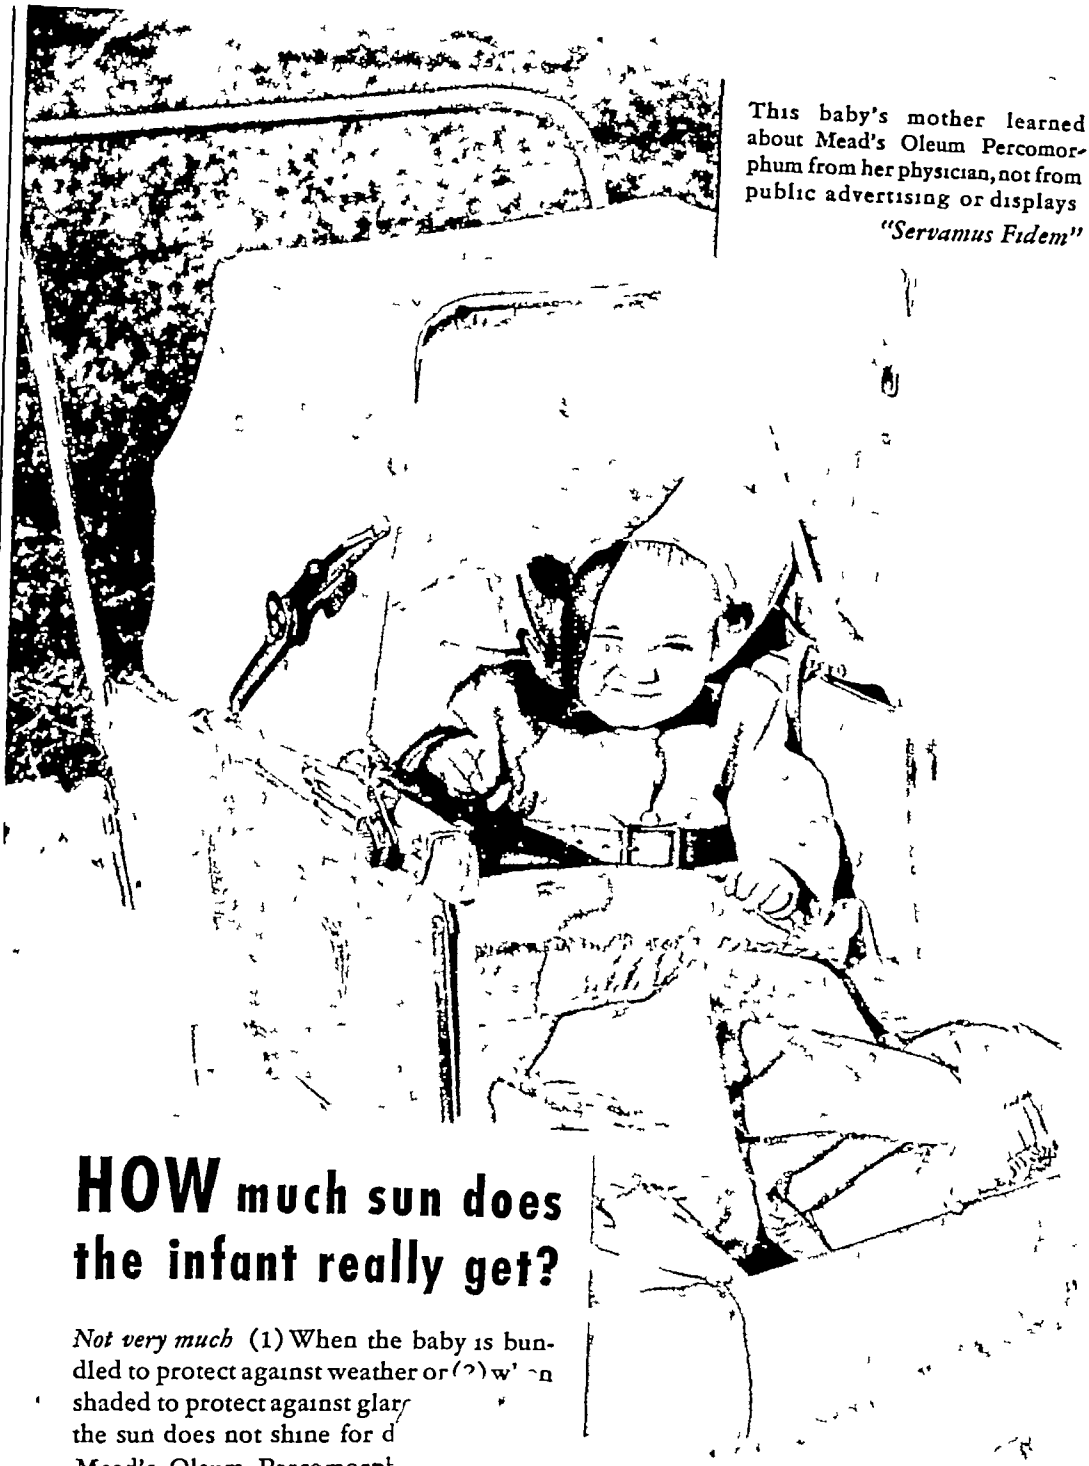
MERCUHYDRIN®

well tolerated locally, a diuretic of choice



Administration prior to or concurrently with digitalization avoids driving the faltering heart against an accumulated fluid burden and prevents the overdigitalization which may occur when postponed diuretic therapy mobilizes previously administered cardioactive glycosides from edema fluid [9]

DOSAGE 1 cc. or 2 cc. intramuscularly or intravenously given daily or as indicated until a weight plateau is attained. Subsequently the interval between injections is prolonged to determine the maximum period permitted to intervene between maintenance injections.

PACKAGING MERCUHYDRIN (mercaluride sodium) is available in 1 cc. and 2 cc ampuls.

CINCINNATI MERRELL 1828 U S. A.

How mild can a cigarette be?

In a recent coast-to-coast test, hundreds of men and women smoked Camels—and only Camels—for 30 consecutive days These people smoked on the average of one to two packs a day Each week, during the entire test period, throat specialists examined these Camel smokers A total of 2470 careful examinations were made The doctors who made the throat examinations of these Camel smokers reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION due to smoking CAMELS!"

According to a Nationwide survey:

MORE DOCTORS SMOKE CAMELS

than any other cigarette

Doctors smoke for pleasure too! And when three leading independent research organizations asked 113 x97 doctors what cigarette they smoked, the brand named most was Camel!

Money-Back Guarantee!

Smoke Camels and test them in your own "T Zone"—T for taste T for throat If at any time you are not convinced that Camels are the mildest cigarette you have ever smoked return the package with the unused Camels and we will refund its full purchase price plus postage *(Signed)* R J Reynolds Tobacco Company Winston-Salem North Carolina

For mixed infections

When a topical antibacterial in liquid form is indicated, Furacin Solution offers this convenience while retaining all the advantages of Furacin Soluble Dressing a wide antibacterial spectrum including many gram negative and gram positive organisms, water solubility to dissolve in wound exudates, low surface tension to penetrate fissures, non staining of skin and fabrics, stability It is being used on wet dressings and as a spray on painful burns Furacin® brand of nitrofurazone, is available as Furacin Solution (N N R) and Furacin Soluble Dressing (N.N R.) containing Furacin 0 2% These preparations are indicated for topical application *in the prophylaxis or treatment of infections of* wounds, second and third degree burns, cutaneous ulcers, pyodermas and skin grafts

In Chronic Cholecystitis:..

First & **Foremost**

chemically pure bile acid derivative made available for therapy, Council-Accepted since 1932, exhaustively studied and most favorably reported by hundreds of investigators, Decholin® remains today a bile acid preparation for use in the medical management of chronic cholecystitis.

The Most Potent Hydrocholeretic,

Decholin multiplies and frees the flow of thinned liver bile By thus easing biliary evacuation and closely simulating a physiologic drainage of accumulated foreign matter through the hepatic and common ducts, Decholin may lessen the epigastric and right upper quadrant discomfort typical of chronic cholecystitis, improve the patient s tolerance for food and reduce the periods of disability

Decholin

dehydrocholic acid

3¾ gr tablets in bottles of 25, 100, 500, and 1000

Decholin Sodium® (sodium dehydrocholate) in 20% aqueous solution, ampuls of 3 cc., 5 cc. and 10 cc., packages of 3 and 20 ampuls.

The Fifth Edition of "Decholin in Biliary Tract Disturbances is now available upon request.

when MIGRAINE attacks

FIRST EFFECTIVE

***oral* TREATMENT**

OF MIGRAINE ATTACK

Sandoz proudly announces the *first effective oral* treatment of migraine—

Clinical investigation[1] demonstrated that 80% of a series of cases experienced good results Best results were obtained in migraine, histamine and tension headaches

Friedman,[2] in a large series of migraine cases, found Cafergone 55% more effective than ergotamine tartrate alone.

Later reports[3] [4] were equally favorable

Cafergone

(ergotamine tartrate 1 mg , caffeine 100 mg)

for choice of a laxative

Phospho-Soda (FLEET)	TYPE OF ACTION
✓	Prompt action
✓	Thorough action
✓	Gentle action

	SIDE EFFECTS
✓	Free from Mucosal Irritation
✓	Absence of Constipation Rebound
✓	No Development of Tolerance
✓	Safe from Excessive Dehydration
✓	No Disturbance of Absorption of Nutritive Elements
✓	Causes no Pelvic Congestion
✓	No Patient Discomfort
✓	Nonhabituating
✓	Free from Cumulative Effects

	ADMINISTRATION
✓	Flexible Dosage
✓	Uniform Potency
✓	Pleasant Taste

Phospho-Soda (Fleet) is a solution containing in each 100 cc sodium biphosphate 48 Gm. and sodium phosphate 18 Gm.

Judicious Laxation

...through freedom from undesirable side effects

The clinical preference for Phospho-Soda (Fleet)* stems in large part from its freedom from undesirable side effects. This desideratum, together with its controlled action and ease of administration, assure safe, effective anticostive therapy from every prescription of this "tried and true" laxative agent. Clinical samples on request.

THE INDICATION DICTATES THE CHOICE OF MEDICATION

Glycerol (Doho) by Exclusive Process has the Highest Obtainable Specific Gravity—and is Virtually Free of Water, Alcohol and Acids

IN ACUTE OTITIS MEDIA

REMOVAL OF IMPACTED CERUMEN

AS AN ADJUNCT TO SYSTEMIC ANTI-INFECTIVE THERAPY, AS PENICILLIN, ETC.

CONTAGIOUS DISEASE EAR INVOLVEMENTS

USE *Auralgan*

because its potent decongestant, dehydrating and analgesic action provides quick, efficient relief of pain and inflammation in any intact drum involvement

FORMULA:

Glycerol (DOHO)	17.90 GRAMS
(Highest obtainable spec. grav.)	
Antipyrine	0.81 GRAMS
Benzocaine	0.21 GRAMS

IN CHRONIC SUPPURATIVE OTITIS MEDIA, FURUNCULOSIS AND AURAL DERMATOMYCOSIS

USE

O-TOS-MO-SAN

a potent chemical combination *(not a mere mixture)*, combining Sulfathiazole and Urea in AURALGAN Glycerol (DOHO) Base—because it exerts a powerful solvent action on protein matter, liquefies and dissolves exuberant granulation tissue, cleanses and deodorizes, and tends to exhilarate normal tissue healing in the effective control of chronic suppurative otitis media

FORMULA:

Urea	2.0 GRAMS
Sulfathiazole	1.6 GRAMS
Glycerol (DOHO) Base	16.4 GRAMS

Literature and samples sent to physicians on request.

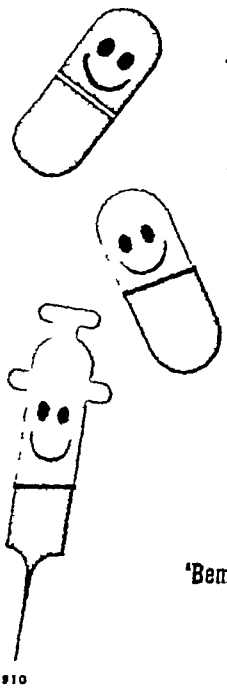
'Beminal'®

For versatile "B" therapy

The 'Beminal' family provides a choice of five distinctive forms and potencies for the effective treatment of vitamin 'B' deficiencies Each is designed to fill a particular need.

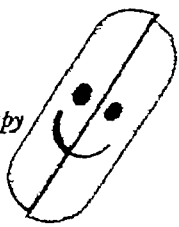


1 **'Beminal'** fortified with Iron, Liver and Folic Acid Capsule No 821 is suggested for the treatment of iron deficiency anemias, certain macrocytic anemias and as adjunctive therapy in pernicious anemia.

2 **'Beminal'** with Iron and Liver Capsule No 816 is recommended for the treatment of the various types of iron deficiency, occurring either as frank hypochromic microcytic anemia or as the less pronounced anemia of nutritional origin

3 **'Beminal'** Forte with Vitamin C Capsule No 817 is suggested when there is severe depletion of the patient's nutritional stores due to either prolonged dietary inadequacy or nutritive failure as a result of organic disease.

4 **'Beminal'** Forte Injectable (Dried) No 495 provides, when reconstituted, a high concentration of important vitamin B factors for intensive therapy



5 **'Beminal'** Tablets No 815 may be of value if the vitamin B complex deficiency is mild or subclinical

LEG ULCERS

the DAXALAN-DOME-PASTE BANDAGE TECHNIQUE

AS INTRODUCED BY DR WILLIAM M. COOPER Director Department of Peripheral Vascular Diseases—New York Polyclinic Medical School and Hospital

This technique is based on a 3 point program—

1. Reduction of dermatitis with wet dressings of DOMEBORO TABS *(BUROW S SOLUTION)*
2. Combat local infection and stimulate healing with thick application of DAXALAN in the center of the ulcer and surrounding areas.
3. Overcome venous insufficiency stasis and edema by wrapping DOME PASTE BANDAGE around the entire leg to supply compression.

DOCTOR! You may now prescribe SOOTHING Modernized Simplified Fresh and Stable BUROW S SOLUTION 1 20 in four forms DOMEBORO Tablets Packets Powder Ointment

Write for samples and reprints from medical literature

DOME CHEMICALS INC. 250 EAST 43rd. STREET NEW YORK 17, N Y

DOMEBORO —Tablets, Powder, Packets Ointment

Daxalan is our trademark for a rigidly standardized whole crude tar paste (low in naphthalene content) uniform in color free of coal tar specks and aged for six months.
Dome Paste bandage is a flesh colored 4" x 10 yd gauze bandage impregnated with a modified Unna s Formula consisting of zinc oxide glycerine gelatine and calamine This Unna s Boot comes to you in a soft condition and is ready for instant use

ADVANCE IN ANEMIA THERAPY

Talso, P J Anemia in Pregnancy, J Ins Med, *4* 31-34 (Dec.-Jan -Feb) 1948-1949

"The encouraging results obtained with molybdenumized ferrous sulfate in the microcytic hypochromic group indicate a better prognosis in these conditions in the future with a resultant improvement in maternal health generally '

Chesley, R. F, and Annitto, J E Evaluation of Molybdenized Ferrous Sulfate in the Treatment of Hypochromic Anemia of Pregnancy, Bull Margaret Hague Maternity Hospital, *1* 68-75 (Sept) 1948

". molybdenized ferrous sulfate produced a substantially more rapid therapeutic response than ferrous sulfate, the difference in response being statistically significant Addition to ferrous sulfate of either liver-stomach extract or folic acid did not potentiate the action of the iron salt

'None of the patients treated with molybdenized ferrous sulfate complained of more than mild digestive symptoms related to the medication However, 8 per cent of the patients originally selected for treatment with ferrous sulfate had to be withdrawn from the study because of consequent digestive up-sets '

White's **Mol-iron** *Tablets, Liquid*

MOLYBDENIZED FERROUS SULFATE

a specially processed, co precipitated, stable complex of molybdenum oxide 3 mg (1/20 gr) and ferrous sulfate 195 mg (3 gr) In bottles of 100 and 1000 Tablets Also available in a highly palatable Liquid, in bottles of 12 fluid ounces

WHITE LABORATORIES, Inc, Pharmaceutical Manufacturers, Newark 7, N J

STATISTICALLY SIGNIFICANT

Recent important investigations confirm superiority of molybdenized ferrous sulfate in iron-deficiency anemia.

Dieckmann, W. J , and Priddle, H D Anemia of Pregnancy Treated with Molybdenum-Iron Complex, Amer J Obstet & Gynecol , (March) 1949.

Dieckmann and associates recently undertook an evaluation of molybdenized ferrous sulfate (Mol-Iron) in anemia of pregnancy—a relatively resistant type of anemia

A carefully selected group of patients was given Mol-Iron in a dosage of 2 tablets 3 times daily, a comparable group of patients who received no iron medication served as controls

FINDINGS: "The patients who were treated showed a rapid increase in hemoglobin and hematocrit with a mean at term of 11 8 Gm per 100 ml and 36 volumes per cent—high figures for pregnant patients The mean for the present control group is 10 7 Gm of hemoglobin per 100 ml and a hematocrit of 32 6 volumes per cent (at term) At six weeks post partum, the patients who had been on molybdenum-iron had a mean of 12 2 Gm per 100 ml as compared with 11 2 for the present (control) group "

COMMENT: "We have never had other iron salts so efficacious in pregnant patients Our results with the molybdenum-iron complex have been so striking that, if the patient has taken this medication for three weeks and shown no significant increase in the hemoglobin concentration, the therapy is stopped and a more extensive study (bone marrow biopsy, gastric analysis, reticulocyte count, etc) made to determine the cause of the anemia "

SUMMARY. "We believe that the value of this molybdenum-iron complex has been demonstrated as being very effective in increasing the hemoglobin of pregnant patients who are anemic "

EVER X-RAY A WHISKEY?

OF COURSE, whiskies can't be X-rayed, but they *can* be analyzed Analysis reveals why today so many physicians recommend light blended whiskies to their patients when whiskey is indicated

For neutral spirit blends contain few congeners, such as fusel oil, tannins, aldehydes, esters, furfurals, acids, etc That means neutral spirit blends are not only light but mild, too What's more, they are usually low in alcoholic content

One of America's leading whiskies of this type is Carstairs White Seal Extremely low in congeneric content, it is blended with care by master distillers unmatched for skill and experience And, though high quality, it is surprisingly *low in price*

Whenever whiskey is indicated, may we suggest that you recommend that superb blend—Carstairs White Seal whiskey—to *your* patients?

The Medical Man who Cares says:

CARSTAIRS White Seal

BLENDED WHISKEY

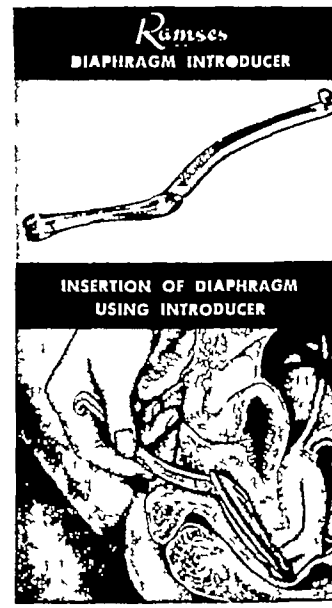
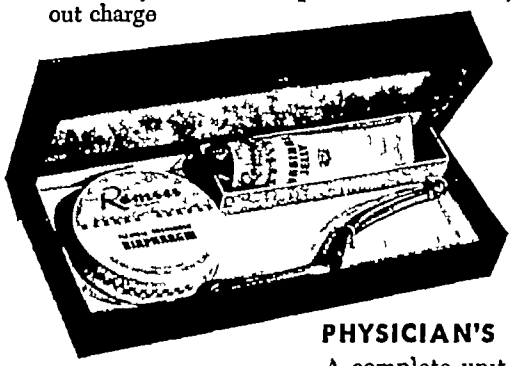
Facts About Conception Control



THE USE OF THE DIAPHRAGM INTRODUCER



Use of a diaphragm introducer is favored by many patients who find manual manipulation objectionable or difficult. It facilitates the insertion and correct placement of the diaphragm, as well as its removal.

The "RAMSES'° Diaphragm Introducer provides the following features

- Simplicity and convenience in use
- Safety – design minimizes possibility of injury to the cervix or accidental insertion into the urethra
- Smooth surface lessens bacterial proliferation – makes for easy cleaning
- Ease of removal assured by bluntly hooked end

The "RAMSES Diaphragm Introducer is supplied in the Physician s Prescription Packet No 501, without charge

Ramses
TRADEMARK REG. U.S. PAT OFF

PHYSICIAN'S PRESCRIPTION PACKET NO. 501

A complete unit for conception control Contains (1) a "RAMSES" Flexible Cushioned Diaphragm of the prescribed size, (2) a "RAMSES" Diaphragm Introducer of corresponding size, and (3) a tube of "RAMSES" Vaginal Jelly† (regular size)

° The word "RAMSES" is a registered trademark of Julius Schmid, Inc.

† Active Ingredients Dodecaethyleneglycol Monolaurate 5%, Boric Acid 1% Alcohol 5%.

"RAMSES" Vaginal Jelly is accepted by the Council on Pharmacy and Chemistry of the American Medical Association The RAMSES Diaphragm and Diaphragm Introducer are accepted by the Council on Physical Medicine of the American Medical Association.

Gratifying Relief

from distressing

URINARY SYMPTOMS

Distressing symptoms of urinary tract infection such as urinary frequency, pain and burning on urination can be relieved promptly in a high percentage of patients through the simple procedure of administering Pyridium orally

With this easy-to-administer and *safe* urinary analgesic, physicians can often provide their patients with almost immediate relief from distressing urinary symptoms during the time that other therapeutic measures are directed toward alleviating the underlying condition.

Pyridium is virtually nontoxic in therapeutic dosage and can be administered concomitantly with streptomycin, penicillin, sulfonamides, or other specific therapy

The complete story of Pyridium and its clinical use is available on request

Parke, Davis & Company

ARE PLEASED TO RECORD THE ACHIEVEMENTS LEADING TO THE DEVELOPMENT OF

CHLOROMYCETIN

Trademark

(CHLORAMPHENICOL, PARKE DAVIS)

CHLOROMYCETIN IS A PURE CRYSTALLINE SUBSTANCE HAVING SPECIFIC ANTIBIOTIC ACTIVITY EFFECTIVE AGAINST AN IMPRESSIVE ARRAY OF MICRO-ORGANISMS

In the history of CHLOROMYCETIN, chance has played little part Starting from past knowledge of antibiotic activity in soil organisms, thousands of soil samples were collected throughout the world, cultured, and screened for antibiotic properties Definite activity was found in cultures of *Streptomyces venezuelae,* an organism named for its place of origin The active antibiotic was then isolated in pure form Its chemical configuration was determined and reproduced by synthesis CHLOROMYCETIN is therefore the first antibiotic for therapeutic use that can be produced in quantities by both natural and chemical methods

The important indications for CHLOROMYCETIN, *thus far include*

UNDULANT FEVER
BACILLARY URINARY INFECTIONS
PRIMARY ATYPICAL PNEUMONIA
TYPHOID FEVER
TYPHUS FEVER
SCRUB TYPHUS
ROCKY MOUNTAIN SPOTTED FEVER

CHLOROMYCETIN can be administered efficiently by the oral route yielding effective blood levels It is supplied in Kapseals of 0 25 Gm

HANOVIA'S INSPECTOLITE

(WOODS LIGHT)

Valuable in Diagnosis

Filtered Ultraviolet Rays, generated by the Hanovia Inspectolite, provides a generally accepted and most satisfactory method for diagnosing Tinea Capitis and other cutaneous infections.

Evolving and fading syphilitic maculopapular eruptions are visible under filtered ultraviolet rays

Eruption of many chronic dermatoses may also be better discerned with the Hanovia Inspectolite

Cutaneous and mucous lesions which do not show definite color contrast with their background, can be seen more distinctly Considerable aid is provided in detecting materials which commonly cause dermatitis venenata

Woods Light and Black Light are commonly applied phrases for describing the visible filtered ultraviolet rays useful for fluorescence excitation

Orapen-250

It is now possible to give 250,000 units of crystalline penicillin G (potassium salt) in one coated, pleasant-tasting, buffered tablet, if you specify the Schenley product. Ample evidence supports the value of the oral administration of penicillin when given in sufficiently high dosage Clinical reports show that even serious infections due to penicillin sensitive organisms—such as acute respiratory illness,[1,2,3,4] impetigo,[4] gonorrhea,[5] and rheumatic fever (prophylaxis)[6]—can be treated effectively by this convenient, painless method of administration

ORAPEN IS UNIQUE
A special coating completely masks the taste of penicillin. ORAPEN is stable at ordinary room temperatures, eliminating necessity for refrigeration.

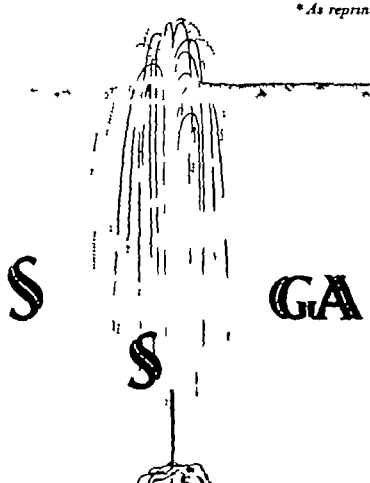
Findings from the Saratoga Spa records*

CORONARY DISEASE

One hundred seven coronary cases were recently studied Of this group 33 were females, 74 males, the latter being chiefly from executive and professional walks of life Not a few were physicians The average age was 61, the range being 40 to 80 years The average duration of symptoms was three years, the limits being one month to 10 years In 32 there was a definite history of coronary occlusion Twenty seven had a history of pre existing high blood pressure, eight of low pressure



Classified according to the American Heart Association 44 were in Class IIA (activity slightly limited) and 63 in Class IIB (activity greatly limited)

Before beginning a regime each patient was subjected to a thorough physical examination together with all indicated laboratory procedures The average of the initial blood pressure readings made at this time was 168 95 The final average figure arrived at was 140-81, a difference of 28 mm of mercury in the systolic and 14 in the diastolic reading These readings were made after a rest period to obviate the influence of any recent activity

Symptomatic Change According to Age Groups

Age group	No Cases	Improvement		
		Moderate	Marked	None
40-50	11	10	0	1
50-60	41	32	5	4
60-70	34	22	8	4
70-80	18	16	0	2
80-	3	3	0	0
	107	83	13	11

(PATCH)

with phenobarbital and homatropine methyl bromide

The tablets are small, need not be chewed and disintegrate quickly in the stomach. Relief is rapid and prolonged. The suggested dosage is 1 or 2 tablets 1 to 2 hours after meals and upon retiring or as prescribed by the physician. Supplied in bottles of 100 and 500 tablets

ALZINOX* (Patch) is also available as plain tablets, each containing 0.5 Gm. (7.7 grains) of dihydroxy aluminum aminoacetate

*Brand of Dihydroxy Aluminum Acetate

The E. L. PATCH CO. BOSTON, MASS

Bi-Pen

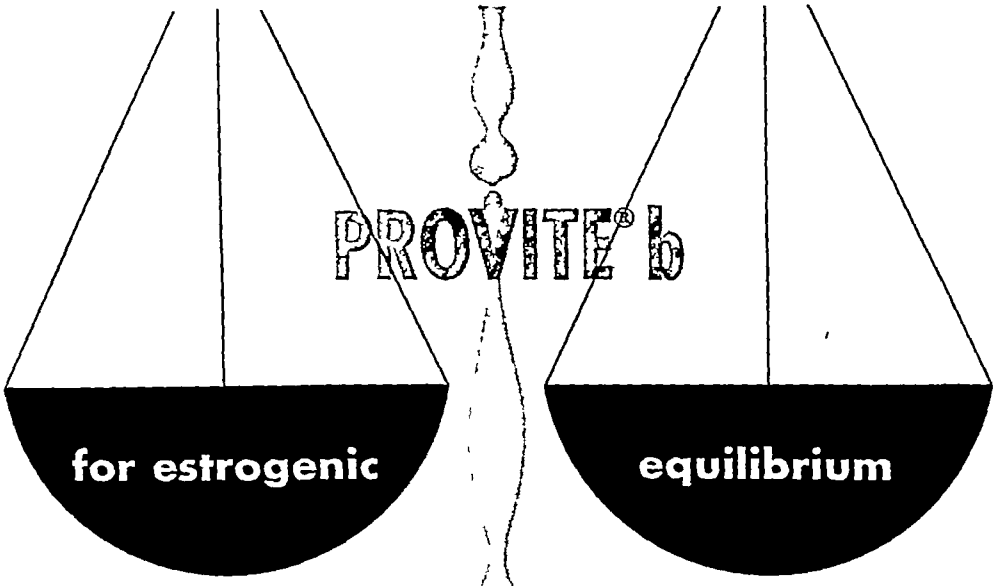
A DUAL *penicillin* FOR HIGHER BLOOD LEVELS

Supply

Bi-Pen is available through all pharmacies in the following package sizes (1) a combination package containing a single dose (400,000 units) in a rubber-stoppered vial and a 1 cc size ampul of sterile distilled water, (2) a package containing 5 single dose vials (water not supplied), (3) a multiple dose rubber stoppered vial containing 2,000,000 units or 5 doses of 400,000 units each

With Bi-Pen, the advantages of rapidly absorbed soluble crystalline penicillin and slowly absorbed procaine penicillin are realized in a single preparation

Containing 100,000 units of buffered crystalline potassium penicillin G and 300,000 units of crystalline procaine penicillin G per dose, Bi Pen quickly produces high initial plasma levels Thereafter, high therapeutic blood levels are maintained in virtually all patients at bed rest for at least a 24-hour period following intramuscular injection Hence a single 1 cc (400,000 units) dose daily is adequate for the treatment of most penicillin-responsive infections In overwhelming infection, 800,000 units may be given daily Injection is practically painless, and local nodulation rarely occurs



In its dry state as supplied, Bi-Pen is stable for 12 months at room temperature After being mixed with sterile water for injection, it may be kept in a refrigerator for seven days without significant loss of potency

CRYSTALLINE PROCAINE PENICILLIN G AND BUFFERED CRYSTALLINE PENICILLIN G POTASSIUM

Failure of the liver to inactivate estrogens leaves excessive amounts circulating in the blood

With administration of the vitamin B complex in high dosage, as provided in **PROVITE b** Capsules, the liver regains its normal function of metabolizing estrogens, proper balance is achieved, and the condition is corrected

Typical symptoms of hyperestrogenism are

- **hyperplasia of the endometrium**
- **cystic mastitis**
- **abnormal uterine bleeding**
- **premenstrual tension**
- **amenorrhea**

To restore estrogenic equilibrium, prescribe **PROVITE b** Capsules Each capsule contains

Thiamine HCl	25.0 mg.
Riboflavin	12.5 mg
Pyridoxine HCl	1.5 mg.
Niacinamide	150.0 mg.
Choline Dihydrogen Citrate	100.0 mg
Inositol	50.0 mg.
d-Calcium Pantothenate	5.0 mg
Secondary Liver Fraction	q. s.
Dried Yeast	q. s.

Write to Medical Department for additional information and samples

MANDELAMINE

REG U S PAT OFF

MANDELAMINE,* a distinct chemical combination of methenamine and mandelic acid, ensures maximum patient-cooperation through its freedom from distressing side-effects, and the welcome simplicity of the regimen—just 3 or 4 tablets taken three times a day is all that is required The absence of drug fastness,[1] plus other important advantages, commends MANDELAMINE to experienced clinicians[2,3] for use in both acute and chronic urinary infections

SUPPLIED: Enteric-coated tablets of 0 25 Gm (3¾ grains), bottles of 120, 500, and 1,000

*MANDELAMINE is the registered trademark of Nepera Chemical Co, Inc, for its brand of Hexydaline (methenamine mandelate)

Urinary Antiseptic of Choice—

for an effective and uncomplicated regimen

6 OUTSTANDING FEATURES

1. No gastric upset
2. No dietary or fluid regulation
3. No supplementary acidification (except when urea-splitting organisms occur)
4. Wide antibacterial range
5. No danger of drug fastness
6. Simplicity of regimen—3 or 4 tablets, t.i.d.

Editorials

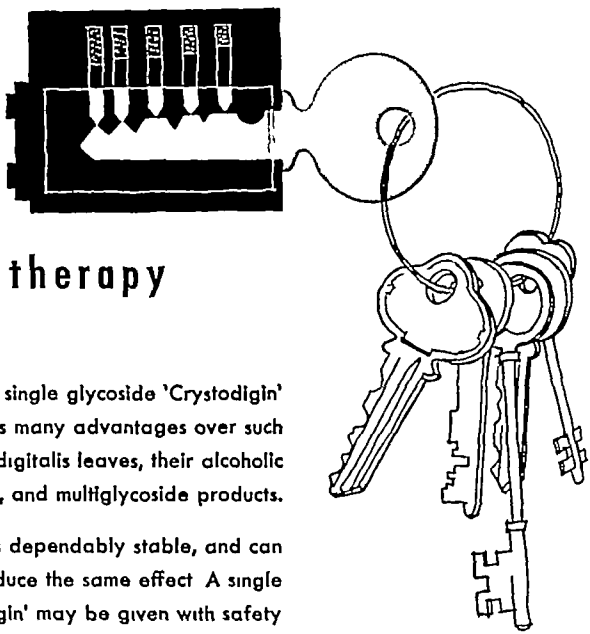
More of the Same Advice Needed

The *Daily News*, New York's picture newspaper, reaches many citizens who never see a medical journal. It carries information to many who probably have seldom heard of the A.M.A. and are even less aware of the Medical Society of the State of New York What the *Daily News* prints about the subject of state medicine, or compulsory health insurance, or whatever, rests on the evaluation by its editors of the newsworthiness of the topic itself

On Saturday, March 12, 1949, appeared the editorial which we reprint below

DR. JOHN BULL

With reference to the Truman Administration's crusade for state medicine, politely called compulsory health insurance, we lift the following paragraphs from a recent report in the Cleveland *Plain Dealer* by a Mr Philip W Porter



"You don't have to listen to the perfectly legitimate objections of doctors and dentists (to state medicine) , all you have to do is to see the way it is working out in Great Britain

"I lived over there and saw it function Thank the Lord, I didn't have to depend on it, for I could go to competent Army doctors But I had plenty of friends who were forced to depend on it, for they had deductions for it taken out of their slim pay and couldn't afford to hire Harley Street specialists

"If what they got under socialized medicine was medical care and competent treatment of illness and disease, then I'm a Tanganyikan rhinoceros The panel doctor's office was an assembly line of 50 patients crowded into the time and space it should have taken him to handle 10 He gave each of them scarcely more than a look and a promise—and often they got the wrong medicine in the rat race Some of the offices were even unclean and some of the doctors were smelling high of drink, but what did they care? Their fees were guaranteed by the Government at so much a head

"And the poor patient, if dissatisfied, couldn't change doctors once he had signed up, without the permission of the doctor he didn't like or without three months for a government board to make up its mind Meanwhile, he could make a choice between paying a competent specialist a stiff fee or dying slowly

the key

to better

digitalis therapy

Possessing crystalline purity, the single glycoside 'Crystodigin' (Crystalline Digitoxin, Lilly) has many advantages over such venerable preparations as digitalis leaves, their alcoholic extracts, and multiglycoside products.

'Crystodigin' is uniformly potent, is dependably stable, and can always be relied upon to produce the same effect A single digitalizing dose of 'Crystodigin' may be given with safety under proper conditions It produces no local gastric irritation Its absorption is practically complete following oral administration Optimum therapeutic effect can be maintained on one daily dose Prescribe 'Crystodigin' for initial digitalization and maintenance in the treatment of congestive heart failure, auricular fibrillation, and auricular flutter

'Crystodigin' is supplied in 0 05 mg , 0 1 mg , 0 15 mg , and 0 2-mg tablets and as Ampoules 'Crystodigin,' 0 2 mg , 1 cc , and in 10 cc. rubber-stoppered ampoules containing 0 2 mg per cc

Complete literature on 'Crystodigin' is available from your Lilly medical service representative or will be forwarded upon request

Hemorrhage

Acute deficits develop rapidly with hemorrhage If plasma volume drops suddenly, shock ensues It has been shown that what was formerly thought to be irreversible hemorrhage shock can be reversible in 50 per cent of dogs bled to this state if the accompanying acidosis is treated with sodium lactate or sodium bicarbonate with glucose in addition to blood replacement [8] Hemorrhagic patients react poorly to saline solution because of acute hypoproteinemia of the blood and the frequent inability of the kidney to excrete sodium when plasma volume is low Whole blood is the answer, and, if surgery is required, large amounts of it (2 to 4 L) should be given preoperatively [3] Where therapy is carefully employed, procedures such as gastrectomy for a bleeding ulcer have no higher mortality than in nonbleeders [9] It is to patients with hemorrhage and substantial blood loss at operation that blood banks make their greatest life-saving contributions As the problem of supplying needed blood becomes more evident, those responsible for the supply become more and more impressed with the futility of the growing practice of using blood for routine surgical patients whose blood loss at operation is insignificant The negative nitrogen balance always observed on postoperative patients is an unimportant factor in patients with good preoperative nutrition This routine nitrogen loss cannot be prevented even by intensive therapy First claim on blood banks is justified for patients who are hemorrhaging, in shock, or who lose considerable blood from surgical procedures Protein hydrolysates can be substituted very effectively for chronic hypoproteinemia states where the urgency of protein replacement is not great

Intestinal Fistulas

In patients with gastric fistulas, those with chronic vomiting and patients in whom there is gastric intubation, the loss of chloride exceeds that of sodium Nevertheless, the loss is serious and can lead to severe dehydration alkalosis Peters warns that the practice of giving patients food and water by mouth who have intubation tubes with suction high in the intestinal tract may lead to severe depletion of electrolytes [10] He recommends nothing by mouth and parenteral feeding as long as intubation tubes are present, but adds that if anything is given these patients by mouth, isotonic salt solution will cause the least loss of electrolytes Nondiabetic ketosis frequently occurs in young children following vomiting Replacement of electrolytes and water in a glucose solution will rapidly correct the severe clinical state As a rule isotonic saline will restore balance to cases of alkalosis

Lower intestinal fistulas cause excessive loss of sodium and lead patients to states of dehydration acidosis The same pattern can follow profuse diarrhea, where relatively more sodium than chloride is lost Here replacement by saline must be made cautiously If the kidney does not excrete chloride, accentuation of the acidosis may cause serious aggravation of the clinical state Sixth molar sodium r lactate is a good parenteral solution in acidosis [11] When this solution is injected, one half of the lactate ions is converted to liver glycogen, while the other half is oxidized to bicarbonate directly Thus both the antiketogenic effect of glycogen and the neutralizing effect of bicarbonate is obtained The sodium cations are released to neutralize accumulated anions Careful clinical notes of the total loss through fistulas are essential for the one who is charged with replacement therapy The hematocrit, protein, chloride, and carbon dioxide concentration may give no indication of the impending disaster [9]

Trauma and Shock

War experience has added emphasis to the long taught axiom that shock must be prevented if possible Newer understanding of the inability of the nephron to withstand anoxia from decreased renal blood flow, plus the evidence of a vasoconstrictor substance which appears to decrease renal blood flow as plasma volume recovers, has given impetus to investigation for better methods of aiding patients out of shock Of prime importance is every effort to maintain urinary flow [9] Most civilian patients reach medical aid before irreversible shock damage is present Quick, competent, and effective use of blood, plasma, and hypotonic fluids will usually restore plasma volume and urinary flow There can be no universal formula for the use of these fluids In

FACTS ABOUT NUTRITION

Prepared by the School of Nutrition, Cornell University, Ithaca
Norman S Moore, M D , Editor

Parenteral Nutrition, V—Clinical States of Salt, Water, and Protein Privation

In a previous issue, a comparison was made of the symptoms of the pure types of dehydration [1] Most clinical problems, however, involve losses of both water and electrolytes In addition, the physician often encounters in dehydrated patients, anemia, hypoproteinemia, and other indications of malnutrition It is the purpose here to discuss the more important clinical situations where electrolyte, water, hypoproteinemia, and changes in acid-base balance occur

Chronic Water Deficit

Chronic water privation is not uncommon and results from an inadequate fluid intake over a prolonged period Clinically this is encountered in debilitated chronically ill patients who fluctuate widely in their fluid and food intakes These patients consume less water than minimal requirements but enough to allow the kidney to hold the solute concentrate of the body fluids usually found in healthy people While reduced water intake gradually decreases plasma volume, the kidey protects the concentration of the extrallular fluids by excreting salt as the body ontent of water falls [2] The osmotic pressure of the body fluids remains normal, unless insufficient water is taken to excrete electrolytes If this occurs, the picture resembles one of acute water deficit with increasing solute concentrations and a rising nitrogen level in the blood In debilitated people, eating diminishes as water deficit increases, which explains in part the hypoproteinemia, anemia, and general undernutrition usually found in these patients The surgical risk in this group is considerable if adequate preoperative therapy is not given [3]

Correction of chronic water dehydration may require whole blood parenterally for anemia and protein hyrolysates for hypoproteinemia Need for kind and amounts of parenteral replacement is usually indicated by the physical appearance of patients and their diet history The duration and severity of symptoms and signs elicited from a history and physical examination will give one indication of the magnitude of the changes present Gradual increase in the extracellular fluid compartments will occur if an excess of water over minimal requirements is given each day For the usual adult 3 L or $^1/_2$ L in excess of minimal requirements will be satisfactory One must be on guard not to give these patients much salt until hypoproteinemia and anemia are corrected Likewise one should not recommend them for elective surgery

Burns

In patients with burns, the accumulation of sodium chloride, protein, and water in the burned area results in the lowering of plasma volume and hemoconcentration [4] Maintenance of adequate blood volume is essential for a high recovery rate In mild burns this can be done with parenteral plasma or whole blood Patients with severe burns require, in addition to whole blood parenterally, a saline or bicarbonate solution by mouth [5] Whole blood also prevents the anemia which is commonly observed during convalescence [6] In severe burns large amounts of whole blood (1 to 5 per cent of body weight in kilograms) and two thirds isotonic salt solution by mouth (10 to 15 per cent of body weight in kilograms) may be required to restore blood volume from shock proportions [7] Care must be taken to prevent symptoms of water intoxication by observing kidney function Burned patients show increased retention of water during the postshock period and therefore decreases in protein, chloride, and sodium concentrations of the plasma do not represent a deficiency but a dilution [6]

Hemorrhage

Acute deficits develop rapidly with hemorrhage If plasma volume drops suddenly, shock ensues It has been shown that what was formerly thought to be irreversible hemorrhage shock can be reversible in 50 per cent of dogs bled to this state if the accompanying acidosis is treated with sodium lactate or sodium bicarbonate with glucose in addition to blood replacement [8] Hemorrhagic patients react poorly to saline solution because of acute hypoproteinemia of the blood and the frequent inability of the kidney to excrete sodium when plasma volume is low Whole blood is the answer, and, if surgery is required, large amounts of it (2 to 4 L) should be given preoperatively [3] Where therapy is carefully employed, procedures such as gastrectomy for a bleeding ulcer have no higher mortality than in nonbleeders [9] It is to patients with hemorrhage and substantial blood loss at operation that blood banks make their greatest life-saving contributions As the problem of supplying needed blood becomes more evident, those responsible for the supply become more and more impressed with the futility of the growing practice of using blood for routine surgical patients whose blood loss at operation is insignificant The negative nitrogen balance always observed on postoperative patients is an unimportant factor in patients with good preoperative nutrition This routine nitrogen loss cannot be prevented even by intensive therapy First claim on blood banks is justified for patients who are hemorrhaging, in shock, or who lose considerable blood from surgical procedures Protein hydrolysates can be substituted very effectively for chronic hypoproteinemia states where the urgency of protein replacement is not great

Intestinal Fistulas

In patients with gastric fistulas, those with chronic vomiting and patients in whom there is gastric intubation, the loss of chloride exceeds that of sodium Nevertheless, the loss is serious and can lead to severe dehydration alkalosis Peters warns that the practice of giving patients food and water by mouth who have intubation tubes with suction high in the intestinal tract may lead to severe depletion of electrolytes [10] He recommends nothing by mouth and parenteral feeding as long as intubation tubes are present, but adds that if anything is given these patients by mouth, isotonic salt solution will cause the least loss of electrolytes Nondiabetic ketosis frequently occurs in young children following vomiting Replacement of electrolytes and water in a glucose solution will rapidly correct the severe clinical state As a rule isotonic saline will restore balance to cases of alkalosis

Lower intestinal fistulas cause excessive loss of sodium and lead patients to states of dehydration acidosis The same pattern can follow profuse diarrhea, where relatively more sodium than chloride is lost Here replacement by saline must be made cautiously If the kidney does not excrete chloride, accentuation of the acidosis may cause serious aggravation of the clinical state Sixth molar sodium r lactate is a good parenteral solution in acidosis [11] When this solution is injected, one half of the lactate ions is converted to liver glycogen, while the other half is oxidized to bicarbonate directly Thus both the antiketogenic effect of glycogen and the neutralizing effect of bicarbonate is obtained The sodium cations are released to neutralize accumulated anions Careful clinical notes of the total loss through fistulas are essential for the one who is charged with replacement therapy The hematocrit, protein, chloride, and carbon dioxide concentration may give no indication of the impending disaster [9]

Trauma and Shock

War experience has added emphasis to the long taught axiom that shock must be prevented if possible Newer understanding of the inability of the nephron to withstand anoxia from decreased renal blood flow, plus the evidence of a vasoconstrictor substance which appears to decrease renal blood flow as plasma volume recovers, has given impetus to investigation for better methods of aiding patients out of shock Of prime importance is every effort to maintain urinary flow [9] Most civilian patients reach medical aid before irreversible shock damage is present Quick competent, and effective use of blood, plasma, and hypotonic fluids will usually restore plasma volume and urinary flow There can be no universal formula for the use of these fluids. In

general, however, one should treat the acidosis accompanying shock and hemorrhage, but should use care not to overcorrect to a state of alkalosis [12] Whole blood because of its oxygen-carrying capacity is enjoying more favor than plasma [13]

Potassium Shock Syndrome

Newer knowledge of the role potassium plays in the shock accompanying diabetic acidosis has helped explain why some patients with severe diabetic acidosis die suddenly of respiratory paralysis a few hours after temporary improvement has occurred from treatment [14] Potassium ions migrate from cells in conditions where excessive excretion of sodium chloride and water occurs It is believed that these ions also are required for glycogenesis in the liver [15] Thus, conditions are ideal in diabetic acidosis for the loss of potassium ions, first from the cells, and later from body fluids through excretion by the kidney When treatment of the acidosis is started, the insulin injected causes potassium ions to be drawn from plasma into liver cells In addition, further decrease in the potassium level of the plasma occurs from the dilution effect of parenteral glucose fluids and from potassium ions passing with sugar from the blood to tissues, following insulin action [6] Respiratory paralysis and sudden death may occur if replacement therapy is not immediately instituted or the patient placed in a respirator [17] There is little danger of toxic effects from replacement excess if solutions are used which have the same concentrations of potassium as extracellular fluid However, if kidney function is poor, toxic accumulations can occur from potassium administration by any route [18]

PRIMARY CARCINOMA OF THE LUNG

CLINICAL ASPECTS

J N HAYES, M D , Saranac Lake, New York

PRIMARY carcinoma of the lung is not only more frequently diagnosed today, but also, it is generally agreed that it has become more common. Apparently it is increasing more than cancer of other organs [1] It makes up 6 to 8 per cent of all carcinoma, and in the male is next to cancer of the stomach in frequency [2] It kills 15,000 people annually in the United States Fortunately, this increased incidence has been accompanied by the training of more bronchoscopists and thoracic surgeons and by advances in respiratory physiology and anesthesiology, the advent of sulfonamides and antibiotics, a greater use of transfusions, and improved understanding of proper postoperative care of patients with thoracic disease It is now fifteen years since the first successful pneumonectomy by Graham We still lack a general education of the public concerning the early symptoms of cancer, and some of the medical profession is not aware of the protean picture of the onset of this disease Recognition of this disease in its earliest stages or, better, before symptoms are produced offers the only hope for improving results in the only curative treatment we have at present, surgical resection.

Pathology

The tumor has its origin from bronchial cells, usually where the stem branches or secondary bronchi divide The principal type, about 50 per cent, is the squamous cell or epidermoid cancer, less frequently the adenocarcinoma and the small or oat cell variety, and, less commonly, undifferentiated anaplastic types Pathologists do not agree on the question of whether there is a true alveolar cell carcinoma Ineda reports that various authors found 8 of 206 primary cancers were of this type [3] The cell types are related to the degree of malignancy, symptoms of onset, ease of diagnosis, manner and frequency of metastasis, duration of life, and amenability to surgical resection It is important, therefore, to determine the type of cancer

Patients with this disease are usually in the forty to sixty-five year group It is well to remember, however, that it is found in earlier decades, even in infancy Men have the disease four to five times more frequently than women Negroes appear to be less susceptible than the white race The right lung is the primary site more often than the left (about 60 per cent) [4,5]

Predisposing Causes—These are unknown, although excessive smoking of tobacco and, in certain industries, radioactive emanations have been blamed The increased incidence has been parallel in the last four decades to industrial development with its noxious chemicals and gases [6] In the outpatient department of the University of Chicago Clinics, where all patients have fluoroscopic examination of the chest, in a special search for pulmonary tuberculosis 91 (0 6 per cent) of 15,000 patients had intrathoracic tumors Of these 25 had primary carcinoma of the lung [7]

Site—The most common site of origin is in or near the hilum, in some series as frequently as 90 per cent [8] Roughly, about 70 per cent begin here, 20 per cent in mid lung, and 10 per cent in the periphery of the organ Therefore, about 60 to 75 per cent are amenable to diagnosis by means of the bronchoscope which cannot be expected to reveal a mass far out in the bronchi *In addition,* the site of origin is related to the occurrence of early symptoms because obstruction of larger

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Session on Chest Diseases May 20 1948.

bronchi produces earlier symptoms and more significant roentgenologic signs than does obstruction more peripherally Also the type of early symptoms is related to the site peripherally pleural pain occurs early, early symptoms from partial or complete obstruction of a bronchus occur more frequently with a hilar focus

Type —Of great importance in early recognition is the type of tumor, because this is related to the speed, frequency, and manner of extension locally and by metastasis The tumor grows along the bronchial wall or through it into the lumen and by lymphatics to the regional lymph nodes or along septal lymphatics to the pleura, or by contiguity into vessels, through the pericardium into heart or into esophagus, or peripherally through the pleura into bones, diaphragm, liver, and nerves When it begins in the mucous glands of a bronchus, Ewing finds it chiefly limited to the bronchial wall, leading to compression of the bronchus with atelectasis and contracted lung Direct extension is greater than in cancer of other organs due to the rich lymphatic system of this organ [4] Coughing spreads cancer cells within the lumina of bronchi

Hematogenous Metastasis —This is usual, and it sometimes occurs so early that the first clinical evidence is the discovery of a remote metastatic focus In the average case, which is the same as saying the case which is discovered late, the incidence of metastasis is high, and therefore, most of these tumors are inoperable In Overholt's series, 14 per cent had no extrapulmonary extension when operated on, Churchill found operation feasible in 33 6 per cent and resection possible in 17 4 per cent [9] Rienhoff was able to resect the lung in 39 per cent [10] Metastases from cancer of other organs encounter the filtering barrier of the lung, this is not so with bronchogenic cancer Fried found pulmonary vessels involved in all of his autopsy cases Moise found no metastases in 10 per cent of his postmortem series The most frequently involved organs are the liver, kidney, bone, brain, and adrenal It has been said frequently that when tumor of brain has been suspected or diagnosed, cancer of the lung as the primary site must be eliminated

Regional Lymph Nodes —Bronchial, paratracheal, and mediastinal nodes are involved in 75 to 90 per cent of all autopsy series Cervical nodes are found to contain cancer in about 10 per cent It is important to examine the axillary nodes because some lymphatics from the thorax drain directly into them without going through the cervical nodes Some superficial nodes may be involved in 5 to 20 per cent of cases Metastasis by lymphatics may also travel through the diaphragm to retroperitoneal nodes

The type of carcinoma varies in different reported series The squamous cell carcinoma is less likely to metastasize by blood stream, more frequently by lymphatics, and is slower growing than the others [3] It extends into the lung more than the small cell type, is less likely to involve the tracheobronchial nodes, and is more likely to begin distal to a main bronchial stem The small cell type more frequently begins in a main stem bronchus and always invades the mediastinum [11] The adenocarcinoma and oat cell type metastasize frequently by the blood stream The oat cell cancer is apt to invade the mediastinum and lung in a diffuse infiltration [9] Koletsky found extrathoracic metastases of the squamous cell type in 35 per cent, of the small cell type in 89 per cent, of adenocarcinoma in 86 per cent

The "alveolar cell carcinoma," which many believe has its origin from bronchiolar basal cells, may be of two types multiple nodular or miliary, and diffuse or pneumonic Metastasis to regional lymph nodes and generalized metastasis are less usual than in the commoner types [3]

Necrosis —In further relationship to the type of cell, necrosis is more common in the squamous cell carcinoma It is very important, therefore, to determine the etiology of chronic pulmonary abscess If it is cancerous and of the squamous cell type, the regional lymph nodes are not so likely to be involved, distant metastasis is less likely than in the other types, and successful resection is more likely Abscess is found in 8 to 26 per cent of cases [12] Other pathologic sequelae include bronchial stenosis and distal bronchiectasis, pneumonia, gangrene, and pleural effusion which may be serous (14 per cent), hemorrhagic (13 per cent), or purulent (12 per cent) [5]

Symptoms

No symptoms are noticed, in the beginning in a small percentage the metastasis attracting the first attention When discovered in an early stage by routine x-ray examination, no symptoms are elicited at all Symptoms with a hilar location may be produced only after a large bronchus is moderately obstructed

Cough.—The earliest symptom is persistent cough or a definite change in characteristic of the chronic cough It is usually dry at first, later accompanied by sputum which early is mucoid, sometimes blood-tinged, or even accompanied by frank hemoptysis The cough may be harassing, nocturnal, and emetic when a papillomatous tumor lies in a bronchus. Discomfort in the chest, a sense of heaviness, or actual pain, usually over the site of the tumor, is noticed early It is not affected by breathing When pleurisy super-

venes or when nerves are involved, the pain becomes excruciating

Dyspnea.—This is sometimes complained of early, resting does not relieve it Shortness of breath is a more common early symptom than in pulmonary tuberculosis Occurring suddenly, it may be an evidence of pleural effusion or of atelectasis Compression of pulmonary arteries and veins by the perivascular infiltration is one cause of the shortness of breath In the Mayo Clinic cases, dyspnea was noticed as often (42 per cent) in the operable as in the nonresectible cases [13] In diffuse tumor dyspnea, cyanosis, and prostration are marked These patients report loss of weight and strength

Wheezing —Unilateral and usually localized over one hilum, wheezing is an early symptom At the age of forty or sixty years, especially in a man, with sputum consistently negative for tubercle bacilli, any of these symptoms demands a thorough examination Since pulmonary tuberculosis and primary carcinoma of the lung sometimes resemble each other and are even found in the same patient, it is worth remarking that some physicians are content with too few examinations of sputum and after several negative concentrated examinations do not use the cultural method frequently enough to eliminate tuberculosis

The earliest symptoms are related to the site of the tumor, whether it grows into the lumen of the bronchus, whether it invades the mediastinum early or progresses into the parenchyma of the lung, to the invasion of the pleura, to the pressure on mediastinal structures, to its speed of metastasis and the site of the seeded cells, and to the secondary changes in the lung as result of infection If the tumor is located peripherally, it is silent for many months and later is likely to cause pleural symptoms, pain, and dyspnea This type, usually a squamous cell carcinoma, is generally circumscribed, not near the hilum and, therefore, not visible through the bronchoscope If it is located peripherally and at the superior sulcus, it presses upon the sympathetic nerves (Horner's syndrome) and through involvement of the first dorsal root causes brachial plexus pain and partial paralysis of the ulnar and median nerves It has a great tendency also to invade ribs and the thoracic wall [14] When growing into the lumen of the bronchus, the tumor produces an harassing cough, the dyspnea of atelectasis, and wheezing When the bronchus is completely obstructed, the wheeze disappears By blocking the airway it leads to atelectasis, distal infection, and bronchiectasis with resulting fever, purulent sputum, ulceration with bloody sputum, and all the signs and general symptoms of pulmonary abscess with its toxic syndrome If the bronchus becomes unblocked, definite symptomatic relief follows, but the chills and fever often recur Cancerous abscess differs from the acute form in that there is usually no sputum with the cough for several months, and the expectoration is less, seldom exceeding an ounce When the cancer invades the mediastinum early, the patient soon feels discomfort in the chest, evidence of pressure on the air passages, and later obstruction of venous return from the head, hoarseness from pressure on the recurrent left laryngeal nerve, or paralysis of the diaphragm from involvement of the phrenic nerve When the tumor cells spread along lymphatics into the lung early, signs of infection are found and later the pleural symptoms The squamous cell carcinoma usually does not metastasize as early as does the adenocarcinoma or the small or oat cell variety, but in any of them the first evidence may be enlarged nodes in the supraclavicular fossa or axilla or on the chest wall, or the signs of brain tumor may attract attention, and properly so, to the presence of primary lung cancer

X-Ray

Usually a very early carcinoma can be discovered only when making routine or survey roentgenograms of the chest In Bloch's early cases the shadow could not at first be differentiated from any small inflammatory infiltrate [7] When such a small lesion excavates, it resembles very closely pulmonary tuberculosis

The first definite clue to the diagnosis is frequently gained from a chest roentgenogram which reveals a mass, usually near the hilum, occasionally more peripheral and circumscribed, often accompanied by the shadow of atelectasis The latter is like ground glass in diffuseness, in size segmental or lobar or including the whole lung The mediastinum and its contents are often enlarged and are drawn toward the involved side, the diaphragm pulled upward Pulmonitis, bronchiectasis, and abscess formation are common sequelae Pleural effusion is common Lateral films help to locate the tumor unless it is hidden by the atelectasis or pleural effusion If the bronchial obstruction is not complete, expiratory and inspiratory films or observation of the respiratory cycle under the fluoroscope may reveal obstructive emphysema, with the mediastinum pushed to the side opposite to the tumor during expiration and with failure of the lung to empty well Also the elevated and motionless diaphragm of phrenic paralysis or the erosion of ribs in the superior sulcus tumor of Pancoast may be seen Occasionally, when atelectasis or pleural fluid hides the tumor mass, a diagnostic pneumothorax may help to reveal it in the x-ray film. Occasionally, planigraphic films may show the

bronchial obstruction The use of bronchography with lipiodol should be carefully considered, because surgeons sometimes find that a resection may have to be postponed for some weeks because of a resulting pulmonitis If history and x-ray are suggestive and no biopsy is obtainable, bronchography and planigraphy may be helpful

With the characteristic symptoms and roentgenologic signs the patient should be referred to a bronchoscopist for a definite diagnosis, or if the tumor is peripheral and beyond the ken of the bronchoscopist, a surgeon should be consulted to consider the advisability of exploratory thoracotomy

Other means may sometimes be employed to arrive at a diagnosis If there is pleural effusion, tumor cells may be searched for in the aspirated fluid The fluid is frequently blood tinged Search for tumor cells in the sputum has not become popular in this country because of technical difficulties, but in the hands of the group at St George's Hospital in London it has been useful in arriving at a diagnosis in 68 per cent of proved cases [15,16] Clerf and Herbert report that examination of bronchial secretions obtained through the bronchoscope is more reliable [17] By this method they found cancer cells in 22 of 30 cases when the biopsy specimen was positive in only 11 They hope that peripheral tumors inaccessible to bronchoscopy may be diagnosed earlier by this means Some other clinics have not found this procedure valuable Finally, in some cases with early metastasis to peripheral lymph nodes, removal and biopsy of the node may lead to a diagnosis It is usually a small cell cancer, whereas positive biopsies from bronchial tumors are usually squamous cell or adenocarcinoma

Aspiration by needle is generally condemned because of the danger of implanting into the chest wall tumor cells or bacteria and because of unreliable results

Physical Signs

As with symptoms, these depend on the site and size of tumor, the degree of bronchial obstruction and secondary infection, and the presence or absence of pleurisy and enlarged superficial lymph nodes The latter is found in about 15 per cent of cases

In early tumor there may be no abnormal signs elicited over the chest for several months after the onset of symptoms When the mass is large enough, dullness to flatness may be elicited over the tumor Resistance to the pleximeter finger has been noted The breath sounds are more likely to be diminished and rales less prominent than in an equivalent lesion due to tuberculosis One may detect the retracted trachea and decreased or lagging thoracic motion and narrowed intercostal spaces of atelectasis, the flatness and sometimes harsher breath sounds, although somewhat distant from the ear, of pleural effusion, and the rales of pulmonitis bronchiectasis, and abscess One should examine for the localized wheezing of bronchial stenosis, especially during expiration, best heard, if it is not constant, by placing the patient on the affected side and having him expire deeply Signs of pressure include acrocyanosis and clubbed fingers, prominent veins on the chest and arm, cyanosis and edema of the face and neck, Horner's syndrome (decreased palpebral fissure, contracted pupil, enophthalmos, and alterations of the sweating and blushing of the affected side) In his syndrome Pancoast mentions atrophy of the shoulder girdle and of the side of the face and coldness or swelling and weakness of the arm

Duration

In Adler's series the duration of life was from ten days to four years Parnell found the duration from onset of symptoms to the time of diagnosis was twelve months in the squamous cell type and six months in the oat and columnar cell types [18] In Tinney's series the duration from onset to death was fourteen and a half months, from diagnosis to death six months [19] Relating the duration of life after the onset of symptoms to the site of tumor, Ochsner and DeBakey found it to be thirty-three and nine-tenths months in the hilar tumor and thirteen and seven-tenths months in the peripheral tumor

The immediate cause of death may be due to rupture into large veins, asphyxia and pulmonary edema, cachexia, and toxic infection, or to the effect of metastatic cancer

Differential Diagnosis

Adenoma of the bronchus may cause the same obstructive symptoms and signs as does carcinoma Hemoptysis is common This disease is more common in women age thirteen to forty four years The course is very prolonged Occurring usually in a primary bronchus, atelectasis and bronchiectasis are frequent sequelae Adenoma of the bronchus is frequently associated with congenital cystic disease and with abnormalities of lobation and bronchi [23,21]

The following conditions should also be considered when the differential diagnosis is being made

Hamartoma is a round mass containing calcium, surrounded by normal lung tissue, usually in the periphery of a lobe [20,21]

In pulmonary tuberculosis the bacilli can usually

be found in the sputum, although the search may be repeated and prolonged. This disease usually involves both lungs, the presence of multiple cavities also favors tuberculosis

Tuberculoma, circumscribed and frequently without sputum, may be difficult to diagnose The presence of calcium in the tumor is against carcinoma. Pulmonary tuberculosis is not infrequently complicated by atelectasis and bronchiectasis. It must be remembered that cancer and tuberculosis occur in the same lung and that acid-fast bacilli found in the sputum from a chronic abscess are not always tubercle bacilli.

When the roentgenogram reveals a hilar tumor with mediastinal mass resembling lymphoblastoma, if no biopsy is obtainable, Scatchard advised trying irradiation for seven to ten days If no recession of the mass results, it is probably cancer [22]

In pyogenic abscess the sputum is likely to be foul at times and is nearly always greater in volume than in cancerous abscess Sometimes the diagnosis can be made only by exploratory thoracotomy

Other conditions which may be confused with pulmonary carcinoma are bronchiectasis, pleural effusion, aortic aneurysm, and chronic pneumonia. Pneumonia, unresolved or relapsing, in a man over forty years of age is very suspicious of cancer Chronic abscess, beginning without a previous operation or after an indefinite respiratory infection, is always to be suspected of cancer

Dermoid tumor is usually in the anterior mediastinum, neurofibroma posterior in the vertebral gutter

Summary

The symptoms and signs of bronchogenic carcinoma are absent in its early stages and later are dependent upon the site and size of the tumor and its cell type Cough, expectoration, hemoptysis, dyspnea, pain in the chest, and localized wheezing are the principal symptoms. The pathologic sequelae of atelectasis, pleurisy, bronchiectasis, abscess, and pulmonitis affect the roentgenologic and clinical picture The carcinoma may be diagnosed by biopsy of a lymph node or by finding characteristic cells in the sputum or pleural fluid The final diagnosis usually is made by the bronchoscopist or surgeon To discover it early the clinician must have the disease constantly in mind.

THE PATHOLOGY OF CARCINOMA OF THE BRONCHUS

OSCAR AUERBACH, M D , Staten Island, New York

(From the Laboratory Service, Halloran Hospital)

SINCE the early part of this century, there has probably been no other pathologic condition which has received as much attention in the medical literature than has carcinoma of the bronchus This is interesting in view of the fact that, in 1896, Pässler could collect only 70 cases of undoubted carcinoma of the lung, and Adler in 1912 found 374 authentic cases, and Weller in 1913 in a rigid critical review could find only 89 cases which met his standards, to which he added one of his own [1-3]

Incidence

A survey of different reports from all parts of the world indicates that carcinoma of the bronchus is found in about one per cent of all autopsies and in about eight per cent of all deaths from carcinoma Some authors believe it second in frequency only to carcinoma of the stomach [4-7]

The increase in reported cases poses the question of whether the increased incidence is real or apparent Much of the literature on carcinoma of the bronchus has been devoted to this question Many authors believe the increase to be real [8-20]

The proponents of the view that the increase is real point to the steady increase in the incidence of reported cases (Fuchs 0 065 per cent in 1885, Wolf 0.223 per cent in 1894, Briese 0 46 per cent in 1916, Barron 0 9 per cent in 1922) [21-24] Other adherents to this belief report a steadily increasing incidence of bronchial malignancies in the same institute Thus Berblinger reports an increase of 2.2 per cent from 1910 to 1914 and 8 3 per cent from 1920 to 1924, while Seyfarth found a threefold increase (5 01 per cent from 1900 to 1906 and 15 5 per cent in six months of 1924) [25,26]

A potent argument in favor of the conclusion that the increase is real is to be found in reports of increased incidence in the same institution under the same direction such as reported by Rosahn, Simpson, Dugmd, and Weller [17 18 27 28] There are other authors who believe the increase to be more apparent than real [29-34] Jaffe, who believes that the increase is more apparent than real, in two separate reports from different parts of the world done in an interval of twenty years, found an almost similar incidence on each occasion [35] We must agree with Klotz that much of the increase in bronchial carcinoma is apparent [36] How much is real will probably never be known

The question arises as to what may account for the great increase in the incidence There are a number of factors of which the increased span of life is prominent Morbidity and mortality statistics disclose a steady increase in longevity Since carcinoma of the bronchus occurs with mounting frequency toward the sixth decade, it follows that a greater number of potential victims are available to fall heir to the disease More thorough examination of the lungs is another factor in the increased incidence Complete microscopic studies are now an integral part of the autopsy Heretofore many of the unreported cases either lacked histologic studies or were wrongly interpreted In the former group some were reported either as chronic pulmonary tuberculosis or as lung abscess In the latter group are many cases of undifferentiated cell carcinomas which were formerly considered to be sarcomata Under the influence of Virchow it was felt that tissue subject to metastatic growth rarely produced primary growth, and the lungs were cited as an example

Material

Our study is based on 50 autopsies, most of which died in an institution devoted to the treatment of tuberculosis, having been admitted to the hospital with the mistaken diagnosis of chronic pulmonary tuberculosis Some of these patients were admitted to the hospital because of a sputum positive for tubercle bacilli, but most were admitted because of the presence of one or more cavities in the lung These subsequently proved to be abscess or carcinoma cavities This common error has been stressed by Hruby and Sweany [37]

Sex —Ninety-two and five-tenths per cent of the series were men and 7 5 per cent women In most reports the ratio of men to women is given as 3 1 There are a number of other authors whose proportion more nearly approaches our own [1,25,37-39]

Many reasons have been given for the great discrepancy in sex incidence Among these have been cigarette smoking and exposure to fumes and dusts All of these are subject to criticism,

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Session on Chest Diseases May 20 1948

and there is general agreement today that no apparent reason for the difference is known

Race.—Eighty-five per cent of this group were white, while 15 per cent were Negroes. A similar distribution in both races was reported by Arkin and Wagner.[40] Jaffe finds the low incidence in Negroes explained by the shorter life span in that race.[35] We question the explanation of the low incidence in Negroes as a result of the shorter life span in that race. We also question the attachment of too much significance to the low incidence of Negroes in some series, since Karsner and Saphir found carcinoma of the bronchus in six Negroes of 25 cases.[41]

Age.—The youngest individual in this group was twenty-five years of age and the oldest seventy-six years of age. The greatest number of cases occurred in the sixth and seventh decades of life, an observation universally reported in the literature (Table 1). It is interesting to note that two of the cases in the third decade of life were women.

Duration.—The total duration of the disease from the onset of symptoms as recorded varied from one to twenty-three months. The vast majority of cases were of less than twelve months duration.
